CASTING OF A LARGE CYLINDER.—The *Colliery Guardian* of Sept. 16th witnessed, at the Atlas Works, Cardiff, the casting of a cylinder which is to form part of a large steam hammer now constructing at those works. We quote: "The cylinder will be bored and finished to the following dimensions:—Diameter, 45 ins.; stroke, 10 ft.; thickness of metal, 3 ins. It has been cast with box-plate, steam-ways, and steam chest in one, and weighs 18 tons. The iron was melted in two cupolas, and supplied with blast from one of Root's patent blowers. The time taken in melting was two hours and ten minutes, and the metal was run into the mould through a sluice from the reservoir in the remarkably short time of fifty-seven seconds. The steam-hammer, for which this cylinder is intended, has been designed by Mr. Macpherson, of St. Petersburg, one of the proprietors of the Baltic Ironworks, in which establishment it is intended to be used for forging large guns and other heavy work. The entire hammer will weigh over one hundred tons, exclusive of the base and anvil block, and will be what is called a double action steam-hammer, being one of the most powerful of the kind that has ever been manufactured."

DUPLEX PLANING MACHINE.—A writer in *Newton's London Journal* describes this as follows:—"It is arranged with double beds and double tables, each table having a separate set of gearing, with starting, stopping and feed motion. There are two tool boxes at the cross slide, each of which is independently self-acting, so as to work with its own table. Thus the two tables may be used separately, as two smaller machines working independently of each other, and capable of planing different lengths of work at the same time; or when planing a large article, the two tables, gearing and motion, may be coupled, so as to form one large machine, an arrangement rendering the machine capable of doing a large variety of work. Also one table may be fixed stationary as a bed-plate to bolt awkwardly shaped or long pieces of work upon, while they are planed by a slide rest fixed upon the other table. When used as one machine, both sets of straps and gearing are in operation, and are reversed by the stops of one table only, so as to insure the straps moving at the same time."

ELECTRO-MAGNETIC BANK LOCK.—At the late Fair of the American Institute there was exhibited a contrivance which is thus described:—"A combination lock is worked entirely by electro-magnetism, and is placed within the safe on the back wall, opposite the door. Its wheels are worked by electro-magnetism, the circuit being controlled entirely by circuit-breakers, placed in an office desk or any other convenient place. No one can unlock the safe without knowing the combination, and no key hole or any other aperture in the walls of the safe exists whereby powder can be inserted. Burglars could only enter a safe provided with this lock by actually penetrating the wall."

ELECTRO-METALLURGICAL.—M. Chantoux, of Paris, has devised a plan for keeping the solution in constant agitation, in order to secure uniformity of strength, and therefore uniformity of deposition. The arrangement of an electro-magnet attached to the battery, puts in motion a small fly-wheel by means of a connecting rod. On the shaft of this fly-wheel, is a band which runs a spiral placed vertically in the solution, by means of which an ascending current is kept up in the middle of the vessel, and a descending current at the sides.

DIMENSIONS OF KRUPP'S 1,000-POUNDED SIEGE GUN.—Length 17½ feet:—Diameter of bore, 14 inches:—Weight, 50 tons—with carriage and turn-table, 90 tons:—Weight of the solid shot, 1,212 lbs.,—of the shell, 1,080 lbs.:—Charge of powder, 110 to 130 lbs.

Scientific Progress.

ANÆSTHETIZING SENSITIVE PLANTS.—In our issue of Sept. 24th, we gave a brief extract from the *Academy* in reference to some experiments with chloroform upon the sensitive stamens of the barberry. In the *Bowdoin Scientific Review* of the 27th, we find an abstract of a paper by Mr. W. Coldstream, giving in detail a number of similar experiments, in which several other anæsthetics besides chloroform were used, and several other plants besides the barberry operated upon. In each case the capacity, in cubic inches, of the bell glass under which the plant was exposed to the vapor, was noted; also the duration of the exposure, and the number of minims of chloroform used. The results varied from zero to complete anæsthesia, and in some cases the death of the plant. One curious effect was, that when the vapor was weak, the sensitive folioles, which completely closed when first exposed to it, would shortly completely expand again, as if they had become accustomed to the action of the chloroform. We give an extract from the portion relating to the experiments upon the barberry:—"Immediately after exposure to the vapor, the irritative action, as in man and animals, first set in; that is to say, the irritable stamens of the flower sprung towards the pistil. This action was instantaneous; but almost immediately they began to move slowly back to their former position, till in a few minutes they were seen to be again appressed to the petals. If now removed from the bell-glass, the stamens were found to be destitute of irritability. Irritability was never lost until the stamens had thus sprung; and in the case of flowers, some of whose stamens only were thus irritated, it was found that those which had not sprung showed undiminished sensibility, while the others had lost every trace of it. Here was true anæsthesia; for if the flowers were now taken and exposed to the warm sun, they were, with very few exceptions, restored to their original irritable condition. They were exposed in bunches of from two to six, so that by one exposure many experiments were, in reality, tried. One bunch of strong young flowers of the *Berberis vulgaris* was exposed four successive times to the action of chloroform vapor, losing its sensibility in each exposure, and then recovering it in the sunshine."

THEORIES OF ELECTRICITY.—"According to a theory of electricity which is making great progress in Germany two electrical particles act on one another directly at a distance, but with a force which, according to Weber, depends upon their relative velocity, and according to a theory hinted at by Gauss, and developed by Riemann, Lorenz and Neumann, acts not instantaneously, but after a time depending on the distance. The power with which this theory, in the hands of these eminent men, explains every kind of electrical phenomena must be studied in order to be appreciated. Another theory of electricity which I prefer denies action at a distance and attributes electric action to tensions and pressures in an all-pervading medium, these stresses being the same in kind with those familiar to engineers, and the medium being identical with that in which light is supposed to be propagated. Both these theories are found to explain not only the phenomena by the aid of which they were originally constructed, but other phenomena which were not thought of, or perhaps not known at the time, and both have independently arrived at the same numerical result which gives the absolute velocity of light in terms of electrical quantities."—*Prof. Maxwell.*

MINERAL AND ORGANOIC CHEMISTRY.—The following, from Prof. Kolbe's paper on the "Province of Mineral Chemistry," is quoted by Prof. C. A. Joy as a fitting close to some remarks upon the accumulating evidence of the agency of life in the transformations of silica and carbon:—"The student of mineralogical chemistry must not now rest content with a mere quantitative analysis, or with the empirical deduction of rational formulae from the results of such analysis. Such a process can never fully elucidate the chemical constitution of inorganic compounds. This can only be accomplished by a careful and systematic study of the decompositions, syntheses and substitutions; in other words, by the application of methods of research similar to those which have yielded such splendid results in organic chemistry."

MOLECULAR SCIENCE—RING VORTICES.—We quote the following from the paper of address of Prof. J. Clerk Maxwell, F. R. S., before Section A, of the British Association:—"A theory which Sir W. Thompson has founded on Helmholtz's splendid hydrodynamical theorems, seeks for the properties of molecules in the ring-vortices of a uniform, frictionless, incompressible fluid. Such whirling rings may be seen when an experienced smoker sends out a dexterous puff of smoke into the still air, but a more evanescent phenomenon it is difficult to conceive. This evanescence is owing to the viscosity of the air; but Helmholtz has shown that in a perfect fluid such a whirling ring, if once generated, would go on whirling for ever, would always consist of the very same portion of the fluid which was first set whirling, and could never be cut in two by any natural cause. The generation of a ring-vortex is of course equally beyond the power of natural causes, but once generated, it has the properties of individuality, permanence in quantity, and indestructibility. It is also the recipient of impulse and of energy, which is all we can affirm of matter: and these ring-vortices are capable of such varied connections, and knotted self involutions, that the properties of differently knotted vortices must be as different as those of different kinds of molecules can be. If a theory of this kind should be found, after conquering the enormous mathematical difficulties of the subject, to represent in any degree the actual properties of molecules, it will stand in a very different scientific position from those theories of molecular action which are formed by investing the molecule with an arbitrary system of central forces invented expressly to account for the observed phenomena. In the vortex theory we have nothing arbitrary, no central forces or occult properties of any other kind. We have nothing but matter and motion, and when the vortex is once started its properties are all determined from the original impetus, and no further assumptions are possible. Even in the present undeveloped state of the theory, the contemplation of the individuality and indestructibility of a ring-vortex in a perfect fluid cannot fail to disturb the commonly received opinion that a molecule, in order to be permanent, must be a very hard body. In fact one of the first conditions which a molecule must fulfil is, apparently, inconsistent with its being a single hard body. We know from those spectroscopic researches which have thrown so much light on different branches of science, that a molecule can be set into a state of internal vibration, in which it gives off to the surrounding medium light of definite refrangibility—light, that is, of definite wave-length and definite period of vibration."

ALTERNATE GENERATION.—We have before alluded to the rusting of wheat by the barberry. In a late number of *Nature*, Mr. Berkeley says:—"There is a microscopic parasitic fungus on the barberry, making orange red spots of rust on the leaves, which is called *Æcidium berberidis*. A different fungus rusts the wheat and other cereal grains, and the couch-grass and other grasses, and is called *Puccinia graminis*. De Bary inoculated barberry leaves with *Puccinia* pollen and got, not *Puccinia*, but *Æcidium* rust. Then he inoculated wheat with *Æcidium* pollen and got, not *Æcidium*, but *Puccinia* rust. But when he tried to make the spores of the barberry rust on wheat, he failed in both cases. It is a clear case of alternate generation; and it seems to account for the well known fact that rust is apt to affect the wheat crops on alternate years. The plant has to pass from wheat to barberry and back again to go through its forms of life. A similar instance is reported of the pear blight and the jelly-like juniper parasite. The great difficulty has always been, that mildew is most prevalent in countries where barberries do not grow, and pear blight where no savina (*juniperus sibirica*) grow. The explanation may be found in the fact; 1. that where the barberries exist the spores of this year's barberries do not produce mildew, but last year's spores which have penetrated the tissues of the young sprouts just issuing from the ground, do; and 2. where there are no barberries, then the subsidiary spores of previous mildewed crops of grasses, especially the mildewed reeds in all fenny lands, keep up the growth of *Puccinia* without any intervention of the *Æcidium* form."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

ITEMS.—*Miaer*, Oct. 8th: Monitor No. 3 is running along the ledge, and the ore improving slowly... Silver Glance is still in casing, and big headway is made.... Millwrights are putting the Exchequer Quartz mill in order. This is the old Davidson mill on Silver Creek.... Better than ever, is the ore now found in the Schenectady (Tarrish) mine lower works.

LOVELY.—*Chronicle*, 8th: Mining operations are progressing finely. Another claim near Silver Mountain has been sold to an English company, and negotiations are pending for the sale of three others.

AMADOR COUNTY.

CONEX.—*Ledger*, Oct. 15th: We were shown some rich rock taken from this mine during the past week. The work of sinking progresses rapidly, and the rock improves—every bucket shows more or less gold.

HINKLEY MINE.—They have one hundred tons of ore now on the dump. A few days ago they came upon another pocket from which they took fifty ounces of gold.

BEIDING, HATCH & Co., have let a contract on the Kearsing mine to sink fifty feet deeper. So far, the prospect has been encouraging. Mr. Beiding exhibited to us a piece of rock that would weigh about three pounds, and contained not less than twenty dollars.

LANCHA PLANA DITCH.—Kerr & Co. have just completed repairs, and as soon as the rains commence they will be prepared to furnish an abundance of water. In addition, they have two large iron pipes that cross the Mokelumne, conveying water to Calaveras county. Mining will be lively the coming winter.

CALAVERAS COUNTY.

SOME QUARTZ.—*Chronicle*, 15th: Sundermier & Co., of Independence, have 300 tons of good quartz in their dump, which will be crushed as soon as it can be hauled to the mill.

HOISTING WORKS.—We understand that a Mr. Sargent has contracted to erect hoisting works on the Poe mine at Railroad Flat. A great deal of rich rock has been taken from the lead, and the prospects warrant the erection of machinery.

INYO COUNTY.

KRAUSGATE.—The Gold Hill *News* gives the result of six assays of ore from this mine, made at that place, the totals of which in gold and silver run from \$64 to \$2,388.

LASSEN COUNTY.

BIG VALLEY.—*Yreka Journal*, Oct. 12th: H. J. Ehlers, one of the proprietors of the rich claim, says they have laid sluices in a small stream, three miles from the claim, and had commenced hauling the dirt when he left. The claim holds out as good as ever. New diggings in the vicinity will be prospected when the rains commence.

The *Yreka Union* of 12th says that Dave Watson, has discovered, about 150 yards above the rich claim, what seems to be a well defined quartz ledge, from four to eight feet in thickness.

NEVADA COUNTY.

GOON YIELD.—*Gazette*, 11th: A crushing of seven and a half tons of rock at Murchie's mill, from the Willow Valley mine, yielded \$563—or \$75 a ton. This is a mine that many thought had petered out.

ORLEANS LEDGE.—This has been traced by the croppings two and a half miles, and all the rock taken from it has yielded \$25 to \$42 a ton.

PROGRESS.—The tunnel by Marselns & Maltman to their Manzanita claims is in 1,000 feet from the lower end. From their shaft they have run another section 335 feet. They have 900 feet more to run.

MULBERRY LEDGE.—*Transcript*, 13th: A crushing of ten tons worked at Stiles' mill, yielded \$200 in gold and a ton and a half of rich sulphurets. This ledge was recently discovered in Burnett's yard on Gold Flat. The shaft is down 105 feet.

HAYES & Co.—Same of 18th: We learn that Irwin Hayes and others have made a big strike in their tunnel. These claims are two miles west of town and are supposed to be part of the Alta Hill lead. This company recently took out a nugget of pure gold worth six hundred dollars; besides they have a bed of gravel which prospects from 50 cents to one dollar to the pan.

HOPE GRAVEL Co.—*Grass Valley Union*, 12th: Last week the clean up was 55 ounces of gold, and the week before 96. There are 25 men employed. The old Rock tunnel

is to be cleaned out for draining purposes, and then the Hope will have to raise its water only 70 feet. To pump to the top requires a lift of 250.

GOLDEN GATE.—Same of 13th: This mine, on Rattlesnake is being worked successfully. The shaft is down 140 feet on the incline, and the ledge at the bottom is three feet thick. The rock shows well in free gold and is heavily charged with sulphurets.

WEBSTER & Co.—Same of 15th: The prospects on Randolph Ridge, continue good. The company are running a drift in the bed rock just under the gravel, in order to ascertain the width of the channel. When gravel is taken out in running this drift, it cleans up well in gold. As soon as the bearings of the channel have been demonstrated, another shaft will be put down.

EMPIRE MINE.—Reconstruction is going ahead with rapidity. The hoisting works will be in running order by the first of next month. By the first of next year the crushing mill will be ready. The new mill is to be of twenty stamps, and will be capable of doing the work of the thirty stamper destroyed.

GREENHORN MINE.—Same of 18th: The new steam hoisting works will be started up to-day. The pump will be running by the end of this week. In the shaft there are 15 or 20 feet of water, which will soon be thrown to the surface. The mill cannot commence crushing until rain comes.

GREAT WESTERN.—These claims are at Ray's ranch, head of Squirrel creek. The company will push work with all speed. The sulphurets are very heavy, and look well.

SIX-HUNDRED DOLLAR NUGGET.—The *Grass Valley Union* of 19th says, in reference to the item in the *Transcript*:—We have interviewed several members of the Hayes company, and they tell us that the nugget mentioned has not been found that they know of. They get some good prospects in their claims, but are not expecting big returns yet. Some one has sold the *Transcript*. The company are running towards ground out of which a \$480 nugget was taken years ago.

PLACER COUNTY.

POTNAM CLAIM.—*Herald*, 15th: We are informed that this claim is prospecting well for a long distance on the surface. It is west of Baltimore ravine, one mile from town.

CRÆSUS.—This is being energetically worked and paying handsomely. We saw some very rich specimens this week. The last crushing yielded over \$30 to the ton.

OPHIR.—The miners are taking out ore, but the scarcity of water has stopped nearly all the mills and some of the hoisting works. The new mill of McFadden and Sears, on Shipley ravine is approaching completion. The owners have a large ledge which prospects well. The owners of the St. Patrick have drifted sufficient to prove their ledge rich at the 128-foot level.

BAID HILL.—From the Wizard mine, owned by Milton and Bell, a crushing has been had at Empire mill which yielded \$30 per ton. This is the second crushing, the former yielding as well.

NORTH FORK DITCH.—The dam is so far advanced as to secure its completion before the rainy season sets in. This dam was swept off by the floods of 1862. We learn that the certainty of a supply of water has induced many miners to locate claims along the line of the ditch and its branches in the lower portion of the county, and lively times are anticipated.

PLUMAS COUNTY.

ITEMS.—*Quincy National*, 15th: The New York mill commenced crushing rock from the ledge on Monday. The Indian Valley has started up fifteen stamps.... The Eureka mine is rolling out, reports say, \$20,000 per month. They have over seventy men employed at the works.... Mr. Bransford, the Superintendent of the Crescent, has struck a body of very rich rock. McIntire & Bidwell have purchased Dr. Drury's interest (one-fourth) in the Union quartz ledge in Indian valley, for \$3,600, cash.

GOOD PROSPECTS.—*Quincy National*, "Uncle" Tommy Taylor has struck good ground in the old Pioneer claims at Newtown, and reports say he is making $\frac{1}{2}$ oz. per day. O'Neill & Bros., are driving their drift ahead, with flattering indications.

SIERRA COUNTY.

ORO LEDGE.—*Downieville Messenger*, Oct. 15th: Watson & Co., proprietors, are pushing their tunnel in earnest, and expect in a short time to reach the pay chimney.

FOREST CITY.—This old camp is consid-

erable of a village yet. The owners of the Live Yankee Claims, from which millions of dollars have been taken, are making \$8 to \$10 per day working old ground.

PORT WINE.—We visited the Monte Cristo Claims. The 400-foot incline is descended in a rail car, operated by an engine at the top. The track is double, one car ascending while the other descends. The water is removed by an iron car, which is let down into a pool and allowed to fill by a swinging door, which closes when the car starts back up the incline.

SISKIYOU COUNTY.

MINING ON THE KLAMATH.—*Yreka Union*, 12th: Messrs. Dean, Keating, and Leonard have been throwing a wing dam into the Klamath, just below the mouth of Scott River. After several interruptions, they last week got into their claim and commenced to wash up. In two days they took out 200 ounces of gold; 45 ounces from a single pan of dirt.

RYAN & WILLIAMS. have struck it rich again in their quartz ledge, on Scott Bar.

VIRGINIA BAR.—*Journal*, 12th: The company at work on the Klamath river at this place, took out seventeen and a half ounces of gold week before last, and no doubt as large an amount last week. The low water permits the miners to work with success.

SHASTA COUNTY.

RICH.—*Courier*, 15th: This week Mr. Banghart obtained something over two hundred dollars from one pan of dirt out of his claim.

SAN BERNARDINO COUNTY.

HOLCOMB VALLEY.—*Guardian*, Oct. 15th: Mr. Geo. E. Moore returned last week from the Green Lead, bringing between \$600 and \$700 with him, the result of 9 tons of quartz rock manipulated with arastras. He is having erected a water wheel 35 feet in diameter, as a motive power to run some 15 arastras, he finding this mode of crushing the most inexpensive.

TRINITY COUNTY.

THE SHAFT.—*Journal*, 15th: At a depth of ninety odd feet, Mr. J. W. Smiley, while visiting the subscription shaft, obtained twenty cents from three pans of dirt. The gold was coarse—the largest piece weighing six cents. As might be expected, our people are mightily rejoiced. The dirt is being prospected all the while. We anticipate a rush of old Trinitarians to their former stamping ground. The shaft is now about one hundred and ten feet deep, and, as may well be believed, will be sunk to the bed rock or to China.

NORTH FORK.—M. H. Engel is driving ahead on his quartz ledge. The rock has been noted for richness, but there was no certainty that a vein of considerable width existed. This question, was solved last week. All the veins come together in a wide ledge.

James Carson, while at work in Weaver Creek, found a specimen seven or eight feet deep in the false bedrock, weighing over two dollars.

BULKHEAD.—Carson & Goering are building an immense bulkhead in Weaver Creek, at the head of their flume. An expense of \$2,000 will render them safe from the floods. This claim was sold a few weeks ago, and the purchasers have already taken out the purchase money.

Nevada.

COPE DISTRICT.

BAID MOUNTAIN.—*Elko Independent*, 12th: The best reports reach us from this district. Located near the main road to White Pine, on a portion of the Ruby range, it is of easy access to the railroad, where ore can be delivered at eight dollars per ton. Wood and water are abundant. The ledges are large and the ore well diffused. Several mines are being worked. One company is preparing to put up a mill and another to build smelting works.

The bullion trade here has grown into great importance. Stacks of bars can be seen at any time on the platforms of the warehouses.

HUMBOLDT.

RICHEST.—*Silver State*, 14th: A piece of ore worth nine dollars per pound was brought to this office Wednesday, from the General Grant (formerly Moonlight) mine, Indian District, seven miles south of town. A Government patent has been secured to the mine. The owners are J. J. Linn, Julien Lott, Col. Buckner and others. The ore in question came from the 60-foot level, where a drift was run from the shaft and the vein was found to vary from two to four feet in width.

STAR.—The mines are looking up, and the number of operatives has been increased of late. Comparative little shipping ore is met with, but large quantities of high grade milling ore.

REESE RIVER.

MONTZUMA DISTRICT.—Belmont Cor. of *Reveille* Oct 13th: The district is 75 miles south of this place. There are three to five hundred tons of ore stacked up at the mines ready for reduction, that I think will pay from \$100 to \$300 per ton. The ore crops out boldly, and the ledges vary from 18 inches to four feet in thickness. The mines are two miles from the mill on the southern side of the mountain, with a splendid natural road. A 10-stamp mill is being erected under the superintendence of Dawley and other mechanics, who are in hope of getting the mill running in six weeks.

REVEILLE DISTRICT.—Same of 14th: Mr. Clark just arrived, reports favorably. He and M. Hawes brought from the district four tons of ore for reduction at the Manhattan mill. About half of the lot was from the Fisherman mine; and judging from the specimen, it will yield hard on to \$1,000 a ton. The Fisherman Co. owns 30 claims. The company's mill of 10 stamps reduces 10 or 12 tons of ore daily, mostly from its own mines; but as the ore is treated without roasting, scarcely more than 40 per cent of the silver is reclaimed.

MINERAL HILL.—The *Elko Independent* of 15th, says of this camp: The immigration is setting strongly in that direction. There is one 10-stamp mill running on custom work, and there is sufficient ore to constantly run 15 stamps more.

An Austin telegram of 19th says: Since Sunday, the Manhattan have shipped to New York, through Wells, Fargo & Co., fourteen bars of bullion, weighing 1,291 pounds, and valued at \$20,273.56.

WASHOE.

OCCIDENTAL.—*Enterprise*, Oct. 16th: The mill is running constantly up to its full capacity. The main tunnel has been driven northward until it is nearly under the rich ore in the levels above. The legal difficulties have been adjusted.

HALE AND NORBORSS.—Producing 185 tons of ore per day. The main shaft is sunk to the eighth level, 90 feet below the seventh, and a drift will be started to-day to cut the ore vein on the new level. The drift will probably reach the vein in going 55 feet east.

YELLOW JACKET.—*News*, 15th: Daily yield 130 tons. The ore breasts continue yielding well. A survey shows the face at the 1,000 foot level to be farther from the wide than has been supposed. The connection will be made about the middle of next week.

SEGREGATED BELCHER.—This company are taking out 25 tons of ore per day, at an expense of but \$3,000 per month. They have out 1,500 tons. The new body continues to look well. The Eureka mill, on Carson, will begin crushing for them on the 1st.

VIRGINIA CONSOLIDATED.—The drifting progresses. They are in good blasting rock and making three and a half feet per day; no water.

CHOLLAR-POTOSI.—Daily yield 240 tons. The indications at the south face of the Potosi tunnel level, in the Belvidere section, are that the ore will make again before the barren streak.

GOULD AND CURRY.—This mine is yielding 90 tons of ore per day, mostly what is called second-class to distinguish it from the few tons of very high grade ore.

CROWN POINT.—The sinking the incline progresses. The drift south, on the 1,100-foot level, is still in porphyry and barren quartz. Receipts for September, \$23,215.18—average of the ore for the month, \$19 per ton.

OVERMAN.—Daily yield 70 tons. The 400-foot level is looking more favorable.

BELCHER.—Looking well. Prospecting vigorously prosecuted. The raise above the 200-foot level, south, shows great improvement.

SAVAGE.—The Savage is yielding 70 tons per day. About 20 of this is from the Potosi deposit and mills over \$50 per ton. They are opening their 3th or new level.

CALEDONIA.—The daily yield is 80 tons of excellent ore, which is crushed at the Piute and Sapphire mills.

SACRAMENTO AND MEREDITH.—Mill running on good ore and the mine yielding an abundance.

OPHIR.—The drift west for the lead is still driven ahead vigorously. Work at the upper mine has been discontinued.

HOPE.—Daily yield 43 tons of \$26 ore, keeping both mills running.

SIERRA NEVADA.—Mill running regularly and mine yielding as usual.

RICH ROCK.—We saw at the Saloon some exceedingly rich ore from the Monte Cristo lean, Flowery District. It shows both native gold and silver. There is said to be plenty of the same kind in the vein.

WHITE PINE.

ITEMS.—News, 16th: In the old workings on the upper level of the Original Hidden Treasure, a large body of low grade ore, which will pay for working, has been discovered. Silver Wave is now 25 feet from Hidden Treasure line, and in good ore. Silver Wedge is taking out fine ore. Ward Beecher is turning out better every day. The dump now contains a large quantity of high grade ore, which is accumulating faster than the teams can haul it away. Aurora North presents a lively appearance. The English company employing 100 men who are extracting low grade ore for the new mill building at the Eberhardt. The mine is looking well. In the Eberhardt during the week, very rich discoveries have been made again, one on the surface workings in front of the large chamber, and the other in the chamber itself. The outside discovery reminds us of the old time specimens. It is hardly anything else but the pure chloride itself. West Wind is working four men, and taking out a little good ore. Consolidated Chloride Flat, has a small force at work, under contract. Truckee had a few tons crushed at the Big Smoky mill, which yielded away up in the hundreds. Of the base metal mines, Fay produces some of the finest carbonates that have been seen in the district. A tunnel has been run 150 feet, in good ore all the way. Burning Moscow and Sunbeam are idle on account of a law suit. Imperial is taking out rich ore. Great Valley is working with good results. Jennie A is turning out better from day to day. The force keep the dump full of rich carbonates. The company has leased the Margary Smelting works. At Mount Ophir considerable ore is being taken out; also around the Monte Christo mill. At the St. Roque some good ore is on the dump. Gov. Matteson has a force at work on the four mines which he purchased lately, extracting plenty of rock for his furnaces. Ticonderoga struck a good body of ore, yesterday.

MILLS AND FURNACES.—The Oasis, at Sherman town, is running steadily on extra good ore from the Eberhardt. Standford is running again. Metropolitan has an abundance of ore on hand to keep it going for some time. Sheba is running on Ward Beecher ore. Swansea has started again. The Big Smoky has never ceased work yet, except for repairs. The Dayton and Manhattan are running. Monte Christo commenced this week, and the new patent Wagner crusher is working to a charm. The Stetefeldt furnace is working with good results. Work on the International is progressing. A large force is employed. The White Pine mill has been started again. Gov. Matteson's two furnaces are running finely, and shipping hullion daily. Work on the refining-furnaces is progressing. The Magary works, leased by the Jennie A. Co., will be started up during the week. Powers' furnace is in full blast. They have run out, since Thursday morning, till 1 p. m. yesterday, 60 bars weighing 190 pounds each.

OUTSIDE DISTRICTS.—Two tons ore shipped from the Oriental mine, Kern District, yielded in Reno \$620 per ton. The Nonpareil has 3 tons ready for shipment to the Monte Christo mill which will work as high. In Robinson some valuable discoveries have been made during the week. The smelting works are shut up on account of a lawsuit, but will be started by the end of this month. At Cooper District the Rappahannock mine shows an immense vein of good ore.

MINING SALE.—Gov. Matteson has bought the following four mines: West Point, Eliza D., Ore and Carlin.

ITEMS.—Empire: A 5-stamp prospecting mill is being put up by Mr. Powers. We learn that there are 14 large teams en route from Elko with machinery for the Eberhardt. R. H. Rogers, Supt. of the Virginia mine, tells us that he has struck a large body of rich ore, from which he made a mill test, the pulp assaying \$57 to the ton.

BULLION.—Wells, Fargo & Co. shipped during September, 106 bars valued at \$129,653.67, of which seventy-one went west and thirty-five east.

BASE BULLION.—During the week ending October 9th, Pritchard shipped 580 bars weighing 54,000 pounds, all of which was from the Rothchilds (Matteson) works, and went East. McIntosh & Barclay shipped 38,320 pounds from the Rathburn furnace to the Jennie A., San Francisco; also, 8,028 pounds to Miller & Gosland, San Francisco, and 10,840 pounds from the Mount Ophir mines to John Seale, San Francisco.

EUREKA.—Sentinel, 15th: Last week Geddes & Bertrand, of Secret Canyon were offered \$100,000 for their interest—two thirds—in the property at that place. They refused it, and the least figure they would set was \$200,000. The smelting and refining works of Ogden, Dunne & Co., will be running by Dec. 1st. They have purchased the Tip Top mine, in the Buckeye & Champion lode.

Colorado.

GEORGETOWN.—Miner, Oct. 13th: The Mendota is yielding richer ore than ever, and more of it. A silver brick weighing 801 ounces, coin value \$837.78, was shipped from the International Mill, East Argentine, a few days since. Morris Tunnel is in 245 ft. Baltimore tunnel is in 560 ft. The Douglass, 80 ft. Orphan Boy lode pays \$384 to \$646 per cord. Gulch mining in Summit has been unusually successful. The yield of the County has been \$500,000. The Stevens mine up to Oct. 1st, has produced \$8,000 at a cost of \$3,500.

FALL RIVER.—Central City Register, Oct. 12th,

The Whale mill has started up again. Several capitalists talk of putting up smelting works, after the Swansea plan, on a very large scale.

GRAND ISLAND.—The "No Name" assays as high as \$3,976.64 per ton. They have taken out ten tons in nine days, with two men, and have on dump a handsome lot of ore. The Idaho is still producing first rate ore. The Cariboo folks are hurrying over their ore. It has accumulated in Prof. Hill's yard considerably beyond the demands of the furnaces. One lot recently assayed 800 ounces. It is believed that the purchase money, \$50,000, will be cleared from the mine within six months. Mr. Everest's first assay on the Monitor showed three ounces of silver per ton. His second, a few feet deeper, sixty-four ounces, third seventy-four, and the last ore shipped within a week yielded 117 ounces. The shaft is now 35 feet in depth.

Montana.

PILGRIM BAR.—New North West, 7th: The Rock Creek Ditch still supplies 1,000 inches of water during the day, and five companies at night. Among the clean-ups we hear of during the week were Holcomb, Berry & Co., \$4,500; Fly, Kohrs & Co., \$2,100; Catehing & Co., \$1,450.

MINERS' DITCH.—Deer Lodge Independent, 8th: The Ditch is completed to Modesty creek. A large number are availing themselves of the offer of the Co. that water is free to those who wish to prospect. The ditch will carry 2,000 inches.

TOP O'DEEP.—Mr. McGhee tells us that the season is about closed, the water not lasting more than one hour per day. Even this is made to yield from \$100 to \$150 per day. The mines on Bilk gulch are also short of water, but pay almost as well.

SUMMIT.—Montanian, Oct. 13: Livelier than for two years. The Excelsior mill was running on rock from the Carerona. The lode is fifteen feet wide, and the rock easily mined. The mill will start on Midas ore next week, and the prospects are that Layton & Bros., will keep it going for some time. The Midas is the most thoroughly opened in Montana. Spring gulch mill shut up after making that big run that turned out the brick of 110 ozs. It will steam up, in a few days again on the Ore Cacho ore. Col. Postlewait is preparing to work the Key Stone; he will erect an engine immediately to hoist water and ore.

A NEW EL DORADO.—The Pick and Ploie for Oct. 7th says that rich gold mines have been found in Eastern Montana, in a south-easterly direction and not over 200 miles from Bozeman. We have seen the gold. It differs in appearance from that of the old camps, being deeper hued. The deposits are said to be very extensive. The opinion is that the new diggings will yield from ten to fifty dollars a day to the hand. The prospects ranged from fifteen cents to a dollar and a half to the pan. The diggings are shallow. It is believed several thousand men can find employment in the basin. The discoverers will not give precise information of the locality until spring.

Idaho.

ROSS' FORK AGAIN.—Statesmen, 11th: Stone & Fisher write denying the statement that the McCoy Basin mines are a humbug. They say there are three strings of sluices in operation paying good wages and over one hundred men prospecting and rigging up sluices.

THE RICHEST YET.—Avalanche, 15th: A large deposit of the richest ore ever seen in camp has just been struck in the fifth level of the Golden Chariot, 80 feet south of the shaft. Fifteen tons were taken out on Thursday, that, at the lowest estimation, will pay \$3,000 per ton, and good judges say \$5,000 to \$6,000. The rich streak is about a foot wide, and is known to extend 30 feet in the stope.

SNAKE RIVER.—Elko Independent, 15th: Mr. E. Burner, of Little Shoshone Falls, in connection with Capt. Bledsoe, has been engaged all Summer on the river, employing about ten men at from \$3 to \$4 per day. Their claim has paid well. They have been running two rockers during the past six weeks, and have averaged \$300 per week. They are now putting up sluices. Many of the miners along the river are making \$5 to \$10 per day.

New Mexico.

ITEMS.—Press and Telegraph, Oct. 8th: Tom Lowthian writes from Grant Co., that they have struck lodes at Silver Flats, that throw the Comstock in the shade. Tom Pollock cleaned up four pounds of gold dust last week—working 13 men, with 100 inches of water.

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICK-SILVER.—By G. Kustel, San Francisco, Dewey & Co. 1870, 12 mo pp. 150.

The main purpose of this book is to explain the bleaching process for extracting silver from certain ores, invented by Kustel and Hoffmann, and successfully practiced by the latter in Mexico. Several years ago we described the main features of the process, but in this book, a number of new details adapted to different ores and circumstances are given. As roasting precedes bleaching, that is fully treated. The book is worthy of Mr. Kustel's reputation as one of the first metallurgical authorities of our own age, and it will be of service to all who study the methods of extracting the precious metals on this slope.—Daily Alta.

STOCK REVIEW.

MISCELLANEOUS STOCKS.

The market for miscellaneous securities has been quiet during the past week, though some sales have been made from private hands. The Central (City) Railroad Co. disburse their usual 1/2 per cent. dividend the present month. At the close, we note sale of Spring Valley Water stock at \$66 50@66 25.

The following quotations have been carefully revised by F. H. Woods, Broker:

MINING SHARE MARKET.

The mining share market was quite active during the period under review, the sales embracing a larger variety of stocks than has been offered for some time past, and throughout the entire list exhibited an upward tendency. We observe, too, that a more hopeful feeling pervades mining interests in general—both in this and our neighboring States, the main feature of success, in our opinion, depending upon the present desire and the strong operations in the direction of a reduction of expenses in every department of this leading commercial pursuit of the Pacific Slope. Nearly every mill in the White Pine District is in successful operation, and since the competition of the East in the matter of reducing ores has created sharp inquiry, the attention of many of our capitalists has been directed to this important matter, with a view of making it still more desirable upon the part of the producers to have their ores manipulated this side the continent.

HALE & NORCROSS—has been in good favor during the past week, at an improved figure. For the week ending October 15th, 192 1/2 tons of ore were taken from the 300 level, and 1,021 1/2 tons from the 7th station level, making 1,214 1/2 tons, against 1,264 1/2 tons the previous week. They have in their dumps 6,431 1/2 tons of ore. The ore-hearths on the 6th and 7th levels, south of the shaft, have improved considerably. The shaft has been carried to the 8th level, the station timbers are being placed, and they will soon commence to drift toward the ore-vein.

CHOLLAR POTOSI—has again come into marked favor, showing a material advance during the period under review. They extracted 1,920 tons of ore during the week ending October 15th, showing an average assay of \$71 09 per ton. The drift east from the Potosi Tunnel has been carried into the quartz four feet, and they have sixty feet to make before reaching the eastern side. The drift south, on the track floor, shows more and better ore than existed at that point seven days ago, and other portions of the ore-producing sections have changed none, with the exception of the 25th floor, where the ore is wider and extends much farther north than it did on the floor below.

GOULD & CURRY—sold somewhat freer at a better figure. For the week ending October 16th 586 1/2 tons were extracted, assaying \$49 06 per ton. The north drift from station A shows some very favorable quartz, assays of which run as high as \$13 per ton.

SIERRA NEVADA—is in better request, with some improvement. During the "run" ending October 14th, they extracted 654 tons of ore, and in 12 1/2 days produced bullion to the amount of \$9,813. A letter states that "the mine is looking very well, and the results likely to be good for a long time, they having plenty of ore in sight." OVERMAN is rather neglected.

For the week ending October 15th, they took out 371 tons of ore, showing an approximate value of \$9,660 69, equal to \$26 04 per ton.

CROWN POINT—sold to a less extent than last

week. They extracted 326 1/2 tons for the week closing October 14th, valued at \$3,500 15, equal to \$10 72 per ton. The incline is down 84 feet below the 1,100 level, the entire face of it showing quartz. The south drift is in 249 feet from the north line, and the ground through which it is passing is very much broken up. The east drift on the 1,100 level is being cleared out preparatory to resuming work there. BELCHER sold freely at a better price. The ground on the 420 level improves as they drive south and "raise."

SAVAGE—continues in large request. They extracted 463 tons, valued at \$14,872, equal to \$32 17 per ton. In running a drift south above the track floor of the Potosi deposit some good ore has been found, without knowing the extent of it. EMPIRE MILL levied an assessment of \$4 per share on the 18th inst. ORIENTAL levied an assessment of 30 cents per share on the 11th. GOLDEN CHARIOT paid a dividend of \$2 50 per share on the 20th.

With reference to the White Pine mines, we take the following from the News of the 16th:

ORIGINAL HIDDEN TREASURE—A large body of low grade ore, but which will pay for working, has been discovered in the old workings on the upper levels, which, after a little clearing away, will be taken out and milled immediately. Work is also being laid out now to continue the old shaft and tunnel so as to form a connection, but it will take some three or four months to accomplish this. Meanwhile the work in the upper levels will be continued, and the ore taken out. The mine in general looks first rate.

SILVER WAVE—Is working a small force and running a level toward the Hidden Treasure. Are now about 25 feet from the dividing line. The level shows good ore all the way. Another level is also being run southwesterly toward the Montauk, from which they are now only about 12 or 15 feet distant.

SILVER WENCE—Taking out some very fine ore, and has a good deal of low grade ore in sight. Work is being prosecuted slowly.

NOONDAY—Is working with very fair results, but has not many men employed at present.

AURORA NORTH—This mine presents a lively appearance now, the English company employing about 100 men, who are extracting a large amount of low grade ore for the new mill building at Eberhardt. The mine is looking exceedingly well, immense quantities of ore which will pay well for milling being in sight.

ENERHARDT—During the last week, some very important and rich discoveries have been made again, one on surface workings outside and in front of the large chamber, and the other in the chamber itself. The outside discovery reminds us of the old-time specimens. It is hardly anything else but the pure chloride itself, and shows a large body of it. The mine is now in such a shape that a very large force could be set to work immediately to very good advantage, extracting ore without doing any dead work. Exploration by which new and rich discoveries are being brought to light daily, are being pushed ahead; and we understand that a large force of men will be employed shortly to extract ore for the new mill. At present, only 15 men are at work.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

Poultry Husbandry.

We have numerous enquiries as to the best breeds of fowls. Such questions are difficult if not impossible to answer. The fact is there are quite a number of "best breeds." While one affords the best and most meat for the table, another, quite inferior in that respect, furnishes the best and largest number of eggs. Still another breed excels as setters, and is quite inferior to either for flesh or eggs. There are no reliable data from which any very intelligent opinion may be drawn. A series of careful comparative experiments, with full and reliable notes, is something much to be desired in this respect; and whoever will undertake such a work will accomplish an immense amount of practical good.

All that is now known of poultry husbandry is gathered up from uncertain, disconnected experiments, most of which are merely one-sided opinions, favoring this or that breed, in the propagation of which the experimenter is generally interested.

Chicken Fences.

One great draw-back to the more general keeping of poultry arises from the mistaken idea that a high and expensive fence is necessary to keep them within bounds. On the contrary a common paling fence, five feet high, with a single strand of small galvanized wire stretched a few inches above the top of the pickets is sufficient to keep within bounds the best winged domestic fowls. When a hen flies over a fence, she invariably calculates either to make a landing on the top or to barely clear the fence. If the wire is galvanized and small enough, she will not notice it, but will fly against it and be thrown back. If one wire fails, a second one just above the first, will be sure to succeed and a hen will not fly over it once in ten years, although it may not be over six feet above the ground. The wire will cost much less than the extra lumber for a high fence, and will stand for an indefinite time.

A Chicken Roost

Should be—especially in this country—open and airy, not close and confined. Fowls should, however, be carefully sheltered from rain, in the wet season. The floor should always be kept clean. We sweep our hen-house floor (an earth one) every morning, as regularly as Bridget does the kitchen. Such care will pay twice over—first in the health of the chickens, and second in the saving of ammonia for the manure heap, which would otherwise escape. It is a good plan to first sprinkle some fresh earth over the droppings, especially if you have a plank floor.

Chicken Feed, etc.

With proper care in cleanliness and food, and with a reasonable amount of room, large poultry yards may be made as profitable or more so, than small ones. The floors, walls and roosts of a hen-house should be kept scrupulously clean. The floors as above stated; the walls should be whitewashed and the roosts should be rubbed over as often as once a month with kerosene to kill and drive away vermin.

There is an establishment in Bohemia, where it is said 15,000 chickens are kept. The hatching is entirely by mechanical process, and the profits are set down at 400 per cent. per annum. But the most remarkable thing connected with this establishment is the fact that the proprietor feeds no grain or meat. He is said to feed his fowls upon worms, which are produced upon the place, (probably by the decomposition of animal and vegetable matter.) We are not advised whether the large profit of this poultry ranch is due to the economy in the manner of producing the food employed, or the general good management of the concern. A publication giving a description of this establishment, the process of feeding, etc., has recently been published in that country, which is

now being translated for publication by some of our Eastern poultry raisers.

With regard to the space which should be assigned to fowls, a good rule may be stated as follows:—for 20 hens, a space 20 feet square feet should be allowed; 30 hens, 30 feet square; 40 hens, 40 feet square; etc.

The sides of the yard should be enlarged one foot for every fowl added. When more than fifty are kept, it is better that a separate yard should be prepared for such excess.

This rule should be applied only when fowls must be shut up; or when the greatest practical economy of space must be adopted, as in or near cities, etc. But whenever circumstances admit, a much larger space should be allowed. The fullest reasonable amount of range is always desirable. Whatever the extent of range allowed, open shelter should always be provided, such as low hushes, or something of the kind. Hens are especially fond of seeking low, green shade, and the more irregular and winding the paths through and among it, the better they like it. An irregular clumpy growth is most desirable.

Mountain Agriculture.

The *Statesman* claims for Idaho territory the largest average yield of wheat, for the present year, of any state or territory in the Union. The first nursery in Idaho was established at an early day by "Cayuse George," who brought his roots from Mission. He also has branch nurseries all over the coast, and at one time could have sold out his original stock for a quartz mine.

MONTANA.—The *Deer Lodge Independent* acknowledges the reception of the following articles—all the production of Bitter Root Valley:—A 25-pound, canteloupe, pepper-pods four inches in length, and two varieties of corn one of which was equal in every respect to the best we ever saw. It is fully matured, the kernels are plump and the cob well filled. One onion measuring 16 1-2 inches in circumference and another over 15. A bunch of tomatoes—growing upon a single stem—weighing nearly eight pounds. After seeing and tasting of this varied and excellent sample of the productions of the Bitter Root valley, the editor is not surprised that it is called the garden spot of the Territory.

UPPER WILLOW CREEK, in the same territory, appears to be another mountain "garden spot." This valley is located near Gallatin, and is about 18 miles long by 6 wide. A correspondent writes from there that Mr. Reeves, of that valley, has raised 14 bushels of Norway oats the present year from three pounds of seed. He has seen in Virginia City, Montana, 61 stalks of these oats growing from a single grain; 35 of which contained near one pint of grain. The evidences of the wonderful agricultural productiveness of our high mountain valleys is really astonishing.

FARMING IN LANDER COUNTY NEVADA.—J. T. Hunter sowed 800 pounds of barley and has 12 tons of as fine barley as was ever raised in California, and it is worth here five cents per pound. From 200 pounds of wheat sowed he cut five tons of fine wheat-bay and has three tons of wheat. He planted three and a half tons of potatoes and has 50 tons of as fine potatoes as were ever grown. We can speak as to them, having been the recipient of a good supply of the esculent. He has also grown a large quantity of beets and turnips of fine size and good quality. If any one supposes that crops of all kinds cannot be grown in the valleys of Nevada, that opinion would be reversed by a visit to this ranch, and seeing the result of a summer's work. If men who think nothing can be done here would exercise a little industry they could make a small fortune in a single season with a certainty that no other occupation can guarantee. There is room in the county for hundreds as good places, and a home market for every product that can be produced.—*Ec.*

CROPS IN WALLA WALLA.—The *Walla Walla Union* says that a gentleman in that place bought and set out a two-year old grapevine last spring, hoping that by another

year he would have some grapes. But later, to his glad surprise, he found that it was going to bear this season; and now it is loaded with the finest grapes. The owner has been offered fifteen dollars for the crop now on the vine, that only four months ago cost but two dollars and a half. The price offered is an evidence of the scarcity and high cost of grapes in Walla Walla, and the *Union* thinks the above experiment shows that they can be profitably raised in that locality.

FARMING IN THE SWEETWATER COUNTRY.

—A gentleman recently from the Sweetwater country gives the *San Diego Union* the following encouraging report of the farming interest in that region:—"In Secatera Valley considerable corn is ripening. On one ranch, where a crop was put in late this Spring, after many had given up on account of the drouth, there are 30 acres of corn in fine condition, and roasting ears are abundant. Here too, are sweet potatoes, squashes, beets, cabbage, cauliflowers, tomatoes, etc. etc., in plenty and of the choicest kind; there is also an acre of peanuts nearly ripe. Mr. Chas. McLean, the owner of this ranch, is a fine illustration of "Young American" enterprise and perseverance. He is not yet 20 years old; he commenced operations a few months ago with a capital of only \$200, and although we have had a "dry season," and "hard times," he now has one of the finest little ranches in the county."

Do Alkali Soils Affect the Character of Wool?

We have received several enquiries with regard to the effect which alkali soils may have upon the character of wool. As the question is one of much importance in view of the rapid increase of the sheep growing interest all through the alkali regions between the Sierra Nevada and Rocky mountains, we submitted the question to Prof. Rowlandson, of this city, who has paid much attention to the subject of sheep raising both in this country and Europe. The Professor's reply, which is hereto appended, will be read with much interest by sheep growers, everywhere.

EDITORS SCIENTIFIC PRESS:—The topic which you have referred to me—the actual or probable influence on the character of the fleeces grown on sheep that feed on alkali soils—is a very interesting one. In pursuance of the promise made to you on the occasion of a recent conversation on this subject, originating from observations and enquiries made by one of your many intelligent agricultural correspondents, I proceed to give my indirect experience, as well as some theoretical suggestions relative to this matter.

Never having had the care and superintendence of flocks whose feeding grounds consisted wholly or principally of what are commonly denominated alkali soils, my observations have necessarily been restricted to such opportunities as have been afforded me by the examination of fleeces so extensively imported into England from the Southern Russian Steppes, and the Cape of Good Hope, both of which districts possess extensive alkali plains. Such fleeces, in my judgment always afforded a harsher feeling when grasped, which would be anticipated prior to handling, by the mere external observation of their relative fineness of fibre.

In viewing this question it ought not to be overlooked that the plains under notice are usually covered with a copious growth of saliferous plants, the "artemesia," frequently predominating—accompanied by only a sparse intermixture of true grasses. In consequence of the fact just stated, animals so fed ingest in their food a much larger amount of alkaline salts than would be the case if fed only upon the *graminaceae*.

Whether this increased absorption of alkaline salts produces any deteriorating effect on the fleeces of animals so grazed, I am not prepared to give any decided opinion; inferentially, however, I am inclined to think that the change, if any, would be very slight, and consider it possible that in the case of your correspondent's complaint of the coarseness of the fleeces of his sheep being intensified by grazing on alkali lands, that the change may have arisen from climatic causes.

Fine woolled sheep taken from the plains of Los Angeles to extremely elevated districts, or northern and cold regions, would have the fineness of their fleeces deteriorated, no matter what land or pasturage they might live upon. This incident com-

plicates the question, and ought to be kept in view, if it is attempted to institute true economic comparisons.

The opinion just given may appear opposed to a statement made in a former part of this communication. It is possible, however, that the harshness so noted may arise from the following cause:—The fact is well known that the fineness of wool, other things being equal, is proportioned to the amount of *yolk*. Now the yolk is simply an animal potash soap, intermixed with a small, but variable amount of an earthy one, chiefly lime.

That potash forms a soft, and soda a hard soap, are facts pretty generally known. In the case of alkali soils, it may readily be conceived how the presence of carbonate of soda, in mass, as compared with potash, may cause the formation, to some extent, of stearate of soda, (hard soap); in this way the harshness of unwashed wool, grown on alkaline soils may possibly be explained. To constitute correct comparisons, it may consequently be found necessary to make trials with washed wool.

It may be mentioned, in connection with this subject, that a general opinion exists amongst those physiologists who have paid attention to the matter, that to the joint action of alkaline soils, and their general accompanying flora is to be attributed the abnormal development of fat-rumped and fat-tailed sheep found in the localities previously alluded to. Indeed, some go so far as to theorise that the abnormal, posterior development of the Hottentot female has a similar origin.

In conclusion, it may be well to remind the reader that while the term "alkali soil" is correct in chemical parlance, it is not so according to common apprehension—the latter application of the term alkali being confined to those compounds which color redened litmus paper blue. The greater part of the white salts, seen on our alkaline soils, are composed of common and glauher salts—both neutral salts of soda.

THOS. ROWLANDSON.

San Francisco, Oct. 16, 1870.

AGRICULTURE AND MINING.—The *Plumas National* predicts a large increase of population to Plumas County within the next two years, from the development of its agriculture in addition to the increase of its mineral resources. Agriculture and mining must go hand in hand in our mining counties or a continued retrogression will be the order of the day.

THE FARMERS in the upper portion of the San Joaquin Valley are much elated and encouraged at the assurance by Mr. Stanford, President of the Central Pacific Railroad, that the contemplated branch for the San Joaquin Valley will reach the town of Visalia in season to move the next year's crop.

OPIMUM IN VERMONT.—Continued success in opium culture is reported in Vermont.

Household Reading.

The "Earth Process" for Making Butter.

A paragraph has been going the rounds of the press for a year or two with reference to a peculiar mode of making butter, employed in some portions of the world, sometimes called the "earth process," and which may be described as follows:

The cream is put into a thick linen or woolen sack, and this sometimes enclosed in still another. The cream so enclosed is buried a few inches deep in the ground, in a sheltered or shady spot, the earth being packed closely over the bag. After remaining in that situation about 24 hours, the bag is dug up, when it is found to contain nothing but butter, which needs only to be "worked" to be ready for market.

Some of our contemporaries have doubted whether butter can be so made; but the fact is well authenticated, and the philosophy of the thing, which is very simple and well understood, may be explained as follows:

The butter globules in cream, as we have frequently stated, are simply little globes of butter, of microscopic fineness, covered with a thin film or skin, and floating in the liquid known as "butter-milk." The butter-milk, being quite limpid, may be drawn away from the less limpid butter, by capillary attraction, or strained out of it by a slow process of that kind, when a gentle pressure is added.

The former is just what is done in the process referred to. The gentle pressure of the earth, when the bag is first buried, starts a straining process, which is subsequently kept up by capillary attraction, after that pressure is removed by the shrinkage of the bag, until nearly all the butter-milk is taken away the balance being readily removed by "working" as is practiced after the ordinary churning process.

However simple this process may be, it is not at all likely that it will ever come into general use, for two reasons:—First for its lack of cleanliness, and second for its wastefulness.

The soil itself, even when *fresh*, will have a more or less unpleasant flavoring influence upon the butter; and this is especially the case, when the process is oftentimes repeated in the same hole; where the decomposing fluids of previous operations have more or less vitiated the soil by their presence. For evident reasons of cleanliness a sandy, loamy soil is preferable to a rich, heavy soil. Another serious objection grows out of the fact of the total loss of the butter-milk, which is always considered of more or less value.

The process however has been considered worthy of some experiments by Mr. A. Mott, who has elaborated a device which he has recently taken steps to secure by letters patent.

He takes a box about two feet high, and first packs it with a layer of dry, porous substance, such as coarse sand, charcoal, lime, etc., over which he carefully spreads a piece of cloth. Then, to collect the butter-milk, he places upon the cloth a 3-inch layer of fragments of sponge, upon which the bag of cream is laid, spread out into a thin cake. Another layer of sponge is then spread upon and around the bag, and the box filled to the top with a like porous or similar substance to that at the bottom. This latter is to exert the pressure and start the capillary action. In 24 hours the butter-milk is all removed and taken up by the sponge, from which it can be removed by pressure. The plan may have some practical value; but we still prefer the old way.

CHEWING GUM.—Chewing gum is made of certain parts of gum-arabic, gum-tragacanth, a small quantity of resin and fat. The fat used is expressed from the bodies of hogs, cats, dogs, and other animals found dead in the streets of cities. Nioe, isn't it?

Beautiful Chemical Experiment.

The following beautiful chemical experiment may easily be performed by a lady, to the great astonishment of a circle at her tea-party. Take two or three leaves of red cabbage; cut them into small bits, put them into a basin, and pour a pint of boiling water on them; let it stand an hour, then pour off the liquid into a decanter. It will be of a fine blue color. Then take four wine glasses; into one put six drops of strong vinegar, into another six drops of a solution of soda; into a third the same quantity of a strong solution of alum, and let the fourth glass remain empty. The glasses may be prepared some time before, and the few drops of colorless liquids which have been placed in them will not be noticed. Fill up the glasses from the decanter, and the liquid poured into the glass containing the acid will quickly become a beautiful red, that in the glass containing the soda will be a fine green, that poured into the glass containing the alum will be purple, whilst that poured into the empty one will remain unchanged. By adding a little vinegar to the green, it will immediately change to a red; and on adding a little of the solution of soda to the red, it will assume a fine green; thus showing the action of acids and alkalis on vegetable blues.

A Grasshopper Exterminating Fly.

It seems that the grasshoppers that are so destructive to vegetation in many places in the central portion of the continent, are likely to find an enemy which threatens their rapid destruction. The *Deer Lodge Independent* says that a fly has made its appearance, closely resembling the common house fly, but much larger, and of a gray mottled color, which deposits its eggs under the wings of the grasshopper. The egg is inclosed in a glutinous substance, which secures it in its position until the worm is matured. It then penetrates the body of the grasshopper, which speedily dies. The worm then burrows in the ground, and at the end of 17 days comes forth a fly, ready to again commence the work of destruction. Mr. William Walker, of Dempsey Creek, informs the *Independent* that twice during the past summer the grasshoppers threatened to destroy his crops, but the flies killed them so rapidly that they did him but little damage. As the grasshoppers were killed before depositing their eggs, it is generally believed that this plague is ended in the Deer Lodge valley.

THE USE OF PICKLES.—There is no nutriment in pickles; but they nevertheless have their use in dietetics. The acid they contain aids the digestive process. With concentrated and fat meats they are especially grateful to the stomach, and in Winter and Spring supply the place of fruits. We all remember with what avidity our soldiers in the late war ate the pickled onions and relishes sent to them. These in fact supplied to some extent the place of both vegetables and fruit.

Josephine and Rose Culture.

The world may be said to owe the rose, as it is, to the Empress Josephine—probably a greater debt than it will ever acknowledge to the man to whose grand purposes she was sacrificed. From 1805 to 1810 she collected at her favorite residence, Malmaison, the choicest variety of roses that could be obtained, and thus gave an impulse to its culture. Of roses there were, in 1814, only one hundred and eighty-two varieties, and there are now more than six thousand, the poorest of which are much better than any which existed at that day. This is but another instance of what can be done by careful cultivation.

WHY WOMEN CAN'T RUN.—The bones of the lower limbs are differently arranged in women than in man. One of the consequences of this is, that no woman can run gracefully. They run, says a witty Frenchman, as if they intended to be overtaken; or, as the boys often say, like a cow. And yet some women want to run for office!

TO RELIEVE A POISONED DOG.—It often becomes desirable to relieve a dog from the effects of poison taken accidentally or otherwise. In such cases the following hint may be useful:—"W. B. M." of Lewiston, Idaho, writes that, when living in Texas, he often had hunting dogs poisoned by strychnine that was set for wolves. He always cured the dogs by pouring down their throats as much milk-warm oil, or grease, as their stomachs would hold.

Hints for Mechanics.

SHRINKING OF TIMBER.—Oak and some other kinds of timber will shrink every time it is dressed. Wagon spokes may be blocked out and laid out in a dry shop for two years, and then if fitted and driven immediately into the hub they will shrink in a few days so as to be loose. They should be fitted and left to dry and shrink before driven. Much of the agricultural machinery made of oak and ash soon works loose, notwithstanding the timber was seasoned, because the seasons were not permitted to season after being cut out for the mortice. The tenons should be made a little full, and left to dry a few days. —*Manufacturer and Builder.*

FOR REMOVING HARD PUTTY.—For removing hard putty from a window-sash, take a square piece of iron, make the same red hot, and run it along the putty till it gets soft. The putty will peel off without injuring the wood work. Concentrated lye, made of lime and alkali, will affect the wood and make it rot quicker.

CLOTH FROM CATS AND RABBITS HAIR.—Machinery has recently been invented in England which weaves from the hair of cats and rabbits a sort of velvet-tissue, distinguishable from silk, but not inferior in fineness and beauty.

BRASS VS IRON.—It seems strange that house-keepers don't buy pails and tubs with brass hoops and trimmings—they cost a little more at first, but last wonderfully, and would be more universally supplied, if there was a larger call for such fastenings and trimmings.

APPLYING EMERY TO WHEELS.—The application of emery to polishing wheels, etc., is much easier than is supposed by many. Emery flour is easily fastened by weak glue to the leather-covered face of a wheel, and as easily renewed when necessary. Usually, oil and emery, applied to the leather covering, is sufficient. There are various kinds of emery wheels made, each claiming some special advantages.

HOW TO PRODUCE AN ECLIPSE.—Place two pins at a suitable distance; then, with a string, form a loop which shall enclose both pins, and with a pencil, run around within the loop, keeping the same tight, and an eclipse will be produced, the greater or less elongation of which will be decided by the space between the pins.

Household Receipts.

HOW TO PREPARE CUCUMBERS FOR THE TABLE.—The Germans have a very good way of preparing cucumbers, which many who cannot eat them sliced in vinegar, like. Slice the cucumbers thin; sprinkle over them a handful of salt; let stand half an hour. By this time they will be wilted, then drain off the watery juice, and wash in three or four waters—enough to extract the salt. Then add some vinegar, (a little only,) and some sweet cream. Pepper thoroughly.

TO KEEP LEMONS.—Housekeepers know how soon lemons lose their flavor and rot. A simple and inexpensive remedy is to place them in a jar filled with water, the water to be renewed every day or two. By this means the fruit can be kept fresh and sound for several weeks.

SNEAKING BOOTS.—Have you sneaking boots or shoes? Saturate the soles with any animal oil, and you will step as softly as a kitten.

PREVENTION BETTER THAN CURE.—To prevent worms from infesting the bowels of children, give them well cooked food with plenty of salt. Salt is destructive to worms.

BRANDIED PEACHES OR PLUMS.—Gather Peaches before they are quite ripe, prick them with a large needle, and rub off the down with a piece of flannel; put them into a preserving pan with cold water enough to cover them, and let the water become gradually scalding hot. If the water does more than simmer very gently, or if the fire be fierce, the fruit will be likely to crack. When they are tender, lift them carefully out and fold them in flannel, or a soft table cloth, in several folds. Have ready a quart or more, as the peaches require, of the best white brandy, and dissolve ten ounces of powdered white sugar in it. When the peaches are cool, put them into a glass jar, and pour the brandy and sugar over them. Cover with leather and a bladder. Apricots and plums can be done in the same way.

TO WHITEN STRAW HATS.—Scrape stick snail-pur with a knife, mix the powder to a mush with water, plaster it thickly over the straw, and place in the hot sun for several hours; brush off when dry. An easy and effectual plan.

Life Thoughts.

BE GENTLE TO THE POOR.—If you cannot *relieve*, do not *grieve* them. Give them soft words, if nothing else. Put yourself in the place of every poor man, and deal with him as you would God should deal with you.

KINDNESS.—A word of kindness is seldom spoken in vain. It is seed which, even when dropped by chance, springs up a beautiful flower.

WHAT IS NOT LIFE.—To eat and drink and sleep; to be exposed to the darkness and light; to pace round in the mill of habit, and turn the wheel of wealth; to make reason our hook-keeper, and turn our thought into an implement of trade,—this is not life.

FORCE OF HABIT.—Few men know the force of habit. A colweh—a thread—a twine—a rope—a cable. Venture not upon the first, the last is nearly past human effort to sunder.

HOW TO ADVISE.—Advice which, like the snow, softly falls, dwells the longer upon, and sinks the deeper into the mind.

The world is in danger of suffering not from the utterance, but from the concealment, of the truth.

KILLING ONE EVIL BY ANOTHER is often and not ineffectually compared to the entailment of the devastations of the wild hog in India by the appetite of the raving tiger. That land, however, is most to be desired as a home which is neither cured by wild hogs nor saved by tigers.

GUARD THE TONGUE.—Words oftentimes inadvertently drop from the tongue which the heart neither conceives nor harbors.

THE DIFFERENCE.—While some are refined like gold in the furnace of affliction there are many more that, like chaff, are utterly consumed therein.

THE VALUE OF TIME.—One hour each day saved from idleness or trifling pursuits, and earnestly devoted to improvements will make an ignorant man wise in ten years.

Infant Slaughter.

The *Pioneer* (woman's organ) of this city makes the following reference to a matter, the importance of which is most unaccountably neglected by community everywhere. "Our mortuary reports show that about forty per cent. of our children die before they attain their fifth year. If stock raisers were no more successful in rearing brutes than are parents in raising children, they would soon become bankrupt. If beautiful and healthy children at the age of fifteen years should command a high money premium from society or the State, or if families rearing children without loss, and at the same time possessing health and beauty, should be entitled to honors and pecuniary rewards, it is very problematical if the present system of slaughtering infants would long continue. Money considerations would prompt the discovery of laws and lead to the adoption of proper food, clothing, exercise and habits favoring health, development, symmetry of form, beauty of feature and longevity, that parental affection, unstimulated by objective influences, would be slow to understand or adopt. Great is the almighty dollar.

CALIFORNIA THE PLACE FOR INVALIDS.—There is good reason to believe that California will soon be selected in preference to any other part of the world as a resort for consumptives, as the more southern portion of the state surpasses in respect to the two essentials,—equable temperature and dry air, Madeira or almost any other known place of resort. The extremes of temperature in January and July and the rainfall on two different localities on the island of Madeira are thus stated: Mentone, 40 and 73 degrees temperature, with 23 inches rainfall; while San Diego shows 51 and 72 degrees with only 10 inches rainfall. If these facts can be generally made known, and the inference as to the suitability of the climate be correct, that which is worth to invalids more than all her gold may be found on our Pacific shore.

NOTHING VALUABLE WITHOUT EFFORT.—Wealth has little value except it has been earned. Even a peaceable disposition is comparatively worthless unless it costs something of an effort to achieve it. No one so much enjoys serenity of mind as he who attains it by a necessary effort to subdue his passions. One who is not susceptible of passion is lacking in an important essential of manhood. Possessing that quality, with the will and power to keep it in subjection, is the most desirable condition of man on earth.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY. GEO. H. STONG.
W. B. EWER. JNO. L. BOONE.

Office, No. 414 Clay St., below Sansome.

Two Editions.—We now use a mining edition and a farming edition of the Press. The difference consists in changing the reading matter of the 6th and 7th pages. [All advertisements appear in both issues, affording an immense circulation.] Subscribers will please notify us if they do not receive the edition they prefer. Both editions furnished to one address for \$7 per annum.

Gold and Legal Tender Rates.

San Francisco, Thursday, Oct. 20, 1870.—Legal Tenders buying @88½; selling @89¼. Gold in New York to-day 113.

Montana Subscribers.

Over three hundred new subscribers in Montana have entered their names on our books within the past two months. This, with a large increase of names from other quarters, is very encouraging to us, and we are induced to give a larger amount of reading than we otherwise could afford to. The recent changes in our paper—i. e., furnishing in its columns more reading that is of general interest to all intelligent industrial citizens of the Coast, has rendered the Press more popular in the mines as well as elsewhere. Mr. W. H. Murray, our corresponding agent, who has just visited Montana, is now furnishing our readers with a good deal of real interesting and useful information about that territory. We regret to state that one of his letters, containing a list of subscriptions between the 1st and 5th of Sept. last, has never come to hand. We now have its duplicate, and the subscribers who have been disappointed, will receive the back Nos., and we hope that each will accept this as a personal and satisfactory explanation.

Work at the City Foundries.

The foundry business is still evidently improving. Not only does it show the effects of the betterment of the mining interests, but it likewise denotes an increase in building, and the general development of the manufacturing interests. In our walks about the iron works this week, we were shown more fully the details of the different departments than we have been for a long time previously,—a fact in itself of considerable significance.

The Vulcan Works are building a very handsome beam engine, 20 in. x 30 in. through, with two air-pumps, 20 x 24 in. through, of brass, for the S. F. Pacific Sugar Refinery. They are building a horizontal engine, 16 x 36, with boiler, 54 in. x 16 feet and with 48 tubes 4 inches in diameter, also with a steam drum 30 in. x 6 feet, all in the best style, for the State

Prison at San Quentin. With these go several hundred feet of heavy line shafting, hangers, pulleys, etc. Two Hephurn roller pans and 2 settlers, of the latest construction, are being made for the Hope M. Co. of Nevada State. All the iron work for the Oakland drawbridge is being made here. The draw will have a roller circle 28 feet in diameter, and on it will be used 7,000 to 8,000 lbs. of castings, besides those for the other parts of the bridge. A 15 horse power engine with hoiler, 40 in. x 12 feet, has been ordered by Mr. O'Donald. Machinery is being fitted up for the Pacific Stone Manufacturing Co.. boiler repairs made for the Pacific Rolling Mills, castings made for the front of the new armory on New Montgomery st., etc. Six tons of castings are produced daily, and 175 to 180 men are employed.

The Golden State works are making a large lot of Knox pans for Angels Q. M. Co., in Calaveras county. These, which are slow working pans, are used for treating sulphurets, and are said to give equally good results, at less than one half the cost, as are obtained by the chlorination process. The pans, we are told, are giving excellent satisfaction where employed, and are coming largely into use. The works are doing considerable in the way of agricultural machinery; are busy on work for the Cal. Peat Co., at Sherman Island; for the Golden Gate Sugar Refinery; and are making a very large amount of shoes, dies, etc., for the mines at Gold Hill and Virginia City. They have on hand bridge work, machinery castings for the Knoxville Quicksilver mines, etc., etc. They drew off 18,000 lbs. of hard iron at one melt on Tuesday.

The Fulton Works are still engaged on Severance & Holt's Diamond Drilling machines, to work with four drills in tunneling. These have two engines and a compressor with two 7-inch cylinders. They are making shafting and gearing for Vance's mill at Mountain City, Nevada. The hydrants for the Oakland Water Works are made here, etc. Their foundry has some 8 tons of castings for shoes and dies.

The Pacific Works have just completed this week their large job for the Lane and Kurtz Cariboo M. Co., to which we have previously referred. They are busy on house work for Goodman's bank at Napa. They are making a set of furnace irons, slag pots and the like, for Mr. Dunne of the Nevada Land and M. Co. These are for a smelting furnace to be put up at Eureka. They have on hand a large amount of work for mining machinery to go by the Mexican steamer, of shoes and dies for the Owyhee M. Co., of Idaho, repair jobs for steamers, etc.

The Miners' Foundry keeps the full complement of men hard at work. They have lately shipped a quartz mill with a Howland crusher to Howland & Co., at Salt Lake, and have built a fine 10 stamp mill, with 5 pans, 3 settlers and 3 agitators, for Rye Patch, Nevada, whence comes the announcement of a big strike, an 8-foot ledge with very rich ore. Orders have come in for their hydraulic hose covering of seamless rope. They are building a beautiful beam engine for the new gas works at the Potrero, which engine will be finished in the handsomest style. They are making some very neat presses and are doing a large amount of miscellaneous work. But their biggest job is making the castings for the State Capitol at Sacramento, the construction of which is being pushed under the supervision of the State Architect, Mr. Henry Keitzer. Twenty-four huge columns for the portico, 42 in. at the base, 36 in. at the top and 30 feet long, weighing 12 tons apiece, are being cast; and these with the cap and base will be some 37 feet high and weigh about 20 tons. They have also the iron work for the large cupola, 50 feet in diameter and 125 feet high, which will contain considerably over 300 tons of iron, and whose top will be some 225 feet above the level of the surrounding streets. For this, 20 columns, 2 ft. 8 in. at the base, 20 in. at the top, and 20 feet high, are to be cast, besides a large amount of other work to make up the amount stated above.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING OCTOBER 22D.

GAS CARBURETER.—John L. Bartlett, Stockton, assignor for one-half his right to William Biven, San Joaquin county, Cal. CANDLESTICK.—Francis C. Cone, San Francisco, Cal., antedated October 5, 1870. FOUNTAIN PEN.—Francis C. Cone, San Francisco, Cal., antedated October 8, 1870. POTATO-DIGGER.—William Dillon, Sonoma Cal. FEED-CUTTER.—Charles R. Donner, Sonoma, Cal. GRAIN-SEPARATOR.—Anthony Duus, San Francisco, Cal. TRUNNION FOR STEAM ENGINE AND CALENDER.—Thomas Hill, Vallejo, Cal. VALVE-GEAR FOR STEAM-ENGINE.—Thomas Hill, Vallejo, Cal. PISTON-ROD PACKING.—Edwin Adison Richmond, San Francisco, Cal., assignor to himself and Charles Watson, same place. WASH FOR THE CUR OF SCAB IN SHEEP, &c.—Hugh Smith, San Francisco, Cal. SAW MILL.—David G. Gay, Eugene City, Oregon. MAIL-BAG FASTENER.—David G. Gay, Eugene City, Oregon. DOOR SPRING.—William F. Kells, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Doubtful Patent Agents.

Whenever an inventor receives a patent now-a-days, he is he-set by a storm of circulars, cards, etc., through the mail from a myriad of patent agents located in the Eastern States, who are anxious to do his business for him in future, and some of them go so far as to offer to take him into co-partnership in securing business from other inventors. The more incompetent and unreliable the agent, the more extravagant are his promises in contrast with those of first-class agents. In rendering a decision in a recent patent case, Commissioner Fisher shows up one of the rascally sort of tricks by which not a few inventors are swindled. A certain letter [written by a solicitor named Curtis] was offered in testimony, to which the Commissioner alludes as follows:

"The first remark which this statement demands is that it is false in fact. No solicitor or any other person has 'a way of obtaining the allowance of a patent in six hours after it reaches the Patent Office.' Cases are received, recorded, and examined in their regular order. They do not reach the examiner until a day or two after they are filed, since they must pass through other rooms, when the fees are received, the cases classified, the application completed, the fees made up, and other formal matters attended to. The examiners, under the great pressure of the numerous applications submitted to them, cannot reach a new case under a week or after it comes into their rooms, so that, under the most favorable circumstances, the thing asserted in this letter is simply impossible. No order is ever granted, under the present administration of the office, to take cases up out of turn, except as provided in the printed rules, even when inventors have come to Washington to attend to their own application, and this because it is simply just that those who send their cases to the office, and trust to the operation of its rules, shall not be set aside at the demand of the clamorous few who chose to attend in person or demand special privileges by friends or attorneys. The rule is imperative, and it has been faithfully and rigidly adhered to.

"But the writer of this letter intimates that this just rule may be set aside by the payment of money. Cases may go through in six hours, he says, 'by the payment of \$75,' and the advantage of knowing this secret he deems to be so great, that he intends to have large fees paid to him for accomplishing this sort of thing.

"This insinuation is also false. It is simply a libel on the Patent Office, a libel which has no foundation in fact. Mr. Curtis never had a patent allowed in six hours

after the application reached the Patent Office, and he never paid to the Patent Office, or any officer thereof, \$75 or any other sum, to secure the allowance of cases out of their regular order.

Inventors ought to know that if they are foolish and wicked enough to pay their money on such pretenses, it will never reach the pockets of the Government officials for whom they suppose it to be designed. It goes no further than the unscrupulous attorney or agent, who, assuming to trade upon the supposed corruption of sworn officers, is willing to slander honest men, and destroy public confidence in the administration of public affairs, in order that he may enrich himself at the expense of his credulous client.

"Instances have come to my knowledge where money has been extorted from clients by agents after patents had actually been allowed but not yet issued, upon the pretense that it was necessary to bribe the examiner. I know of no case where the money went beyond the solicitor. No practitioner can assert with truth that he possesses any facilities by which he is enabled to procure patents in advance of any of his competitors beyond his knowledge of the forms and routine of the office, and his skill and care in the preparation of his cases. To take money from his clients under the pretense that it is to be used to procure such facilities is to add theft to falsehood."

Steam Plows for California.

The Standish Steam Plow, to which we referred last week, is expected to continue its journey to California, after being exhibited and tested at Cincinnati. Thompson's Road Engine and Steam Plow for the Tide Land Reclamation Co., to which reference has been made in the Press, has arrived and is in the bonded warehouse in San Francisco, where it will remain until the recent Act of Congress comes in force, permitting the first importation of improved agricultural inventions free of duty, which occurs on the 1st of January, 1871. This machine has a gang of eight plows, capable of cutting some 14 inches each, in width, and advancing at the rate of about four miles an hour. Its weight is some eight or nine tons, and its engine 25 horse power, American rate. The engine and plows were tested very satisfactorily before being shipped from England and are pronounced suitable for the hardest of soil. We look forward with interest to its first trial, and with confidence that the day is not far distant when our State will be materially benefited by the success of steam plowing.

MECHANICS' INSTITUTE FAIR.—The managers of the Mechanics' Institute, being determined to make the next Fair as excellent as possible, have already commenced preparations, although the Fair will not be held before September, 1871. They are desirous of having it on a broader basis than ever before, and are corresponding with interested persons in various countries. The directors have appointed a committee to report a plan of action, consisting of Messrs. H. C. Kihbe, H. L. Davis & B. P. Brunner. Among other prizes, two have already been determined upon,—for the best essay on the Timber of the Pacific Coast, having reference to its strength, durability, texture, fibre, grain, etc., as ascertained by actual experiment, and proved by illustrations and data; and for an essay on the Stone of California, showing its peculiar properties and adaptation for street improvements and building purposes.

LOSS OF THE CONTINENTAL.—The North Pacific Transportation Co's Steamer Continental, on her return trip from Mazatlan to San Francisco, sprung a leak on the 28th of September and was abandoned on the 30th, the passengers and crew taking to the boats for Cape St. Lucas, which was 30 miles distant, where they arrived in safety. Seven passengers and the cook refused to leave the vessel, through fear, and were lost. The Continental had \$140,000 in treasure, 700 tons of salt, and a large amount of mail matter.

Gunpowder and Dynamite Blasting.

The effects obtained by exploding certain bodies depend on the suddenness of the combustion. Chemical calculations, we are told, show that, for a given result, the expansion produced by the explosion of nitro-glycerine, giant powder and other aluminates is no larger than that produced by gunpowder. But in the case of the former, the effect is concentrated in a very short space of time, and hence they are preferable for blasting in mines, and, in general, where a destructive agency and not a propelling force is required; and for the same reason they have not as yet been introduced in gunnery.

Although much has been said of late concerning the merits of various explosive compounds, the number of which is legion yet we think that our readers will find it interesting to hear the results of some comparative experiments made in Germany. In a railroad tunnel, now being driven near

Vienna, Austria, after certain progress had been made, the nature of the rock suddenly changed, the material becoming so very hard that the engineers were compelled to give their attention to more powerful blasting powders. Their experiments were concerning the relative merits of gunpowder and dynamite. The result has been published, but we consider it proper to acknowledge our indebtedness to the *Manufacturer and Builder*, whose condensation we have used.

In using gunpowder, it is necessary to incline the bore-hole to the surface, sometimes even as much as 45°, in the hardest rock, in order to obtain the greatest advantage; the bore-hole is therefore always one quarter to one third larger than the distance from the charge to the surface of the rock. Moreover, the explosion never removes the rock further than the depth of the hole, and often in hard rock, the lower part of the bore-hole remains intact. Both of these points are illustrated in Fig. 1. With dynamite, on account of the suddenness of the explosion, no inclination of the hole is necessary, even in the toughest rock; the length of the bore-hole is therefore shorter, producing a saving of time. But what is more important in this respect, the dynamite acts not only to the full depth of the hole, but also usually below for an additional depth equal to one quarter to one third that of the hole. This is illustrated

in Fig. 2. Again, a considerably smaller volume of dynamite produces the same effect as a larger volume of gunpowder, and hence the hole may be made smaller—another saving.

Experience has shown that, with dynamite, the most advantageous depth of the bore-holes in very hard rock is from two to four feet, in case they are bored in a flat surface, surrounded on all sides, where the blast can remove the material only in the direction of the hole. It was shown that with deep holes the effects became less. Two bore-holes, eight feet deep and two inches in diameter, were drilled and then several smaller holes, two or three feet deep and one inch in diameter; the number of the latter being such that they together contained the same charge as the two larger

holes. The result was that the effect of the greater number of smaller holes was sixfold that of the two large ones. When, however, the rock has two or more free surfaces, bore-holes of eight and 12 feet, and even deeper, have proved useful. Such a case is represented in Fig. 3.

The most striking illustration of the economy of dynamite was obtained when

the rock is situated in layers, as shown in Figs 4 and 5. With gunpowder several blasts are necessary (Fig. 4), while with dynamite a single hole will produce more effect (Fig. 5), the dotted lines indicating the limit of action in the two cases. Another advantage is that dynamite never wastes its force between these layers of rock as gunpowder often does.

The most convenient and the safest form in which to use dynamite is that of cartridges. Nobel's cartridges are cylindrical, three quarters to two inches in diameter and one to eight inches long, covered with parchment paper. These must fit in the bore-hole and be firmly pressed down with a wooden ramrod; as they are soft and plastic, they are easily made to fill the whole space, which is necessary in order to obtain the full effect. A cartridge of the smallest size is placed on top, the explosion of which serves to set off the whole mass.

There are three ways to ignite the charge.

1. With gunpowder (Fig. 6). Five cartridges are placed in the hole, and on top of these is poured gunpowder, to the height of one or two inches, in which is placed the end of a slow match. The hole is then filled with sand firmly rammed down; if it is loose, so that it can be displaced by the powder charge, the latter will not transmit sufficient pressure downward to the dynamite which will, in this case, not explode but only burn slowly. The use of gunpowder is not so good as the following means:

2. With Nobel's safety match (Figs. 7 and 8). This is at the end provided with fulminating powder inserted in the small top cartridge spoken of above. For this purpose, one end of the cartridge is opened and the match so inserted that it does not touch the dynamite of the cartridge, else the force is lost and more suffocating fumes (chiefly carbonic oxide) evolved than by the regular simple explosion. The cartridge thus prepared is then enveloped in paper, tied to the fuse and lowered into the hole; sand, earth or even water may be loosely poured on top. This method is simple and rapid and seldom fails.

3. With frictional electricity. This is particularly advantageous where several charges are fired at once. Three kinds of fuses are used:—those of Abegg, of Bohemia, made of sheet iron with iron wire conductors; of Trauzl, of Bohemia, made of paper with copper wire; and those of Farmer, of Boston, of wood and copper wire. The first are very cheap, being sold in Germany at the rate of 120 for \$1. They are represented in Fig. 9. Two thin iron wires attached to a strip of thick paper, have

their upper ends bent outward, while their lower ends are, with the paper, immersed in the fulminating powder contained in the bottom of a smaller cylinder of tinned iron. The fuse of Trauzl is represented in Fig. 10. This is more expensive, and consists of a paper envelope below, containing the fulminate, covered with a cork, through which pass two copper wires, touching the fulminate below, while the greater part of their upper ends are protected and isolated by a covering of vulcanized rubber or gutta percha. The Boston fuse is simpler,

consisting of a small oval capsule, filled with a fulminate, in which the free ends of two copper wires terminate. These are firmly attached to the wood, and their very long projecting ends are covered with a sealing material. When the hole is tamped with water, the wires must be isolated with a covering of gutta percha, or by placing them in two separate grooves in a stick and filling up with hard fat or some other non-conducting material. Experience has shown that the conducting wire outside the hole does not require careful isolation.

Mr. Abegg has carefully and extensively studied the business of blasting, the manufacture of cartridges, fuses, etc., the comparative merits of different methods and the attendant expenses, and has obtained

very valuable results. He found that the effect obtained by the action of the dynamite and the electric fuse is, on an average, double that obtained by the common blasting method, using dynamite and the gunpowder fuse, or Nobel's safety fuse. Hence the electric method has been exclusively adopted in the operations near Vienna, and in many other localities. The effect is violent and single pieces of rock are projected with such force, that extraordinary care must be taken for the protection of the laborers. The explosions are accompanied by a very loud report, and a pungent odor which is not injurious to the health. In the works near Vienna, no sickness has

been observed among the workmen. At the Hoosac Tunnel, Mass., it is said that the laborers have often suffered from poisonous effects of the odor of nitro-glycerine, or dynamite. The symptoms are violent pains in the head and neck, which are magically relieved by the use of good strong coffee.

The electric machine used is of the frictional kind, and costs only \$24 in Germany. Such a machine will ignite from 8 to 12 charges (at once) in dry weather, and from 6 to 8 in wet weather.

In America various frictional electric machines are made, of different sizes, some small enough to be handily carried about. But the great trouble with all frictional machines is, that so much care must be taken to render them independent of the atmosphere. Without considerable precaution they are utterly useless in rainy weather or damp localities. They are objectionable where the common miner wishes to use them, without being obliged to have an electrician to manage the machine, as they are too liable to leakages, unless carefully handled.

The Beardsley machine is used by the U. S. Engineering corps on this coast, and was employed at the blowing up of Blossom Rock. The principal objection against

it appears to be that it wears out rapidly, does not retain its power any length of time. The best machine we know of in use in California is the "Dynamo-Electric Exploder," manufactured by the Siemens Bros. of London. One has been used for a considerable time at Smartsville for the big blasts without ever failing. It will explode 25 charges at once, and has been used over 80 miles of wire successfully. It has been dropped and otherwise undergone considerable hard usage, but is as good as ever. The price in London is 22£. 10s. (about \$112 50).—With it the Abel fuse has been employed. The fulminate is composed of 10 parts sub-phosphide of copper, 45 parts sub-sulphide of copper and 15 parts of chlorate of potassa. It costs about 10 cents apiece.

SHERMAN ISLAND.—A number of the land owners of Sherman Island have earnestly protested against the damming or closing up of Myberry Slough, on the ground that not only would it injure the interests of a large number in a commercial point of view, the slough being navigable for vessels of 300 tons burden for a distance of eight miles from its mouth, but it would also be wrong and dangerous in sanitary respects, as by preventing the free flow of water in and out, a stagnant fever and malaria breeding pond would be formed.

COTTON FACTORY.—It is stated that certain parties are intending to establish a cotton factory in this city. The subject of cotton culture is exciting very considerable interest throughout the State, and very much of interest has appeared in the columns of the Press.

THE AMOUNT of silver yearly used for photographic purposes is estimated at 500 cwt., which certainly seems enormous.

Our Agents.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelein's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 28, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PER- SPIRATION, or, in other words, the VAPOR EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them any way, but especially if sweet- ened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and

FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs;

FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread;

FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence,

FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

AND BLA-TING
POWDER,
FOR SUPERIOR QUALITY, FRESH FROM THE
MILLS, it being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER,
Which combines all the force of other strong explosives
now in use, and the lifting force of the best blasting
powder, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Pow-
der can be obtained on application to our Office.
16v20-3m JOHN F. LOHSE, Secretary.

DESIGNS AND PLANS
—FOR THE—
NEW CITY HALL
—OF—
SAN FRANCISCO.

Office Board of City Hall Commissioners, southeast
corner of Sacramento and Montgomery streets, San
Francisco, June 22, 1870.
The Board of City Hall Commissioners hereby give
notice that they will be prepared to receive at their
office, on or before the FIRST DAY OF NOVEMBER
NEXT, designs and plans for the new City Hall of San
Francisco.
The Commissioners, in order to obtain the very best
design and plan, invite the fullest competition among
architects, and to this end have resolved to offer the fol-
lowing premiums:
First—For the design and plan selected and
adopted\$2,500
Second—For the second best design and plan..... 2,000
Third—For the third best design and plan..... 1,500
Fourth—For the fourth best design and plan..... 1,000
Fifth—For the fifth best design and plan..... 500
The premiums payable in City Hall warrants.
As a guide to architects in the preparation of the de-
signs and plans, the Commissioners have prepared a
pamphlet containing full instructions and suggestions,
as well as the terms and conditions upon which the pre-
miums will be awarded.
Pamphlets can be had on application at the office of
the Commissioners.
Any design or plan in which the requirements of the
Board, as set forth in the printed instructions, have not
been reasonably complied with, will be rejected from
the competition.
P. H. CANAVAN, Chairman,
JOS. G. EASTLAND,
CHAS. E. McLANE,
City Hall Commissioners.

PAIN KILLER
PROF.
1840 1870
DR. J. C. DAVIS & SON, PROVIDENCE, R. I.

This celebrated medicine has won a deservedly high
reputation as an alleviator of pain and a preserver of
health. It has become a household remedy, from the
fact that it gives immediate and permanent relief. It is
a purely vegetable preparation, made from the best and
purest materials, safe to keep and to use in every fam-
ily. It is recommended by physicians and persons of all
classes, and to day, after a public trial of thirty years—
the average life of man—it stands unchallenged and unex-
ceeded, spreading its usefulness over the wide world.
Its large and increasing sale affords positive evidence of
its enduring fame. We do not deem it necessary to say
much in its favor as one small bottle will do more to
convince you of its efficacy than all the advertisements
in the world. Give it one fair trial and you will not
be without it for ten times its cost.
Directions accompany each bottle.
Sold by all Druggists.
Price 25 cts., 50 cts., and \$1 per bottle.

Reading for the Hour.

The Bruges Belfry Chimes.

The author of "Stories from My Attic" gives the following readable sketch of the chimes heard pealing from the belfry towers in the quaint old Belgium town of Bruges:

A long, dark staircase leads, step by step, within the tower to its top. At last, a narrow ladder leads into the chamber where the bells are hung. There is the great bell of all, and there besides are forty seven other bells, of different weight, ranging from twelve to nearly twelve thousand pounds, and it is on these that the chimes are rung. They have the sweetest tone of all the bells in Belgium. In our country, a chime is a rare thing; and when Mr. Ay-liffe rings the chimes at Trinity Church, in New York, on public days, the programme is published in the newspapers, and at the hour people stand about the head of Wall street, to hear with all their might, while as far as the bells can be heard people are listening as to something quite unusual. It is different in Belgium, and indeed in other European countries, where they are most common.

It would not be possible for any one standing at the foot of the tower to ring the chimes at Bruges by pulling now upon one rope, now upon another, as he wished to ring a particular bell. To make it possible for the performer, there is a very ingenious contrivance in the chamber below that containing the bells, by which the musician sits at a great key-board, like that of a piano, the keys of which connect with the hammers that strike the bells. He strikes the keys, not with his fingers but with his fists, which are guarded by leathern coverings; and though great force is required, sometimes being equal to two pounds' weight on each key, musicians have acquired marvelous skill in playing on these colossal instruments; they can indeed play music in three parts, the base being played on pedals, and the first and second trebles with the hands.

But the chimes are sounded every fifteen minutes, and it is plain that no musician could be so constantly at work. In fact, it is only occasionally, upon Sundays chiefly, that any one plays upon the bells; for generally the bells play themselves. There is a great cylinder in the chamber, from the circumference of which project pegs placed at proper intervals, according to the order in which each bell is to be struck. This is made to revolve by clock-work, and the pegs are thus brought into contact with levers operating upon the bell-hammers. The whole is a sort of gigantic music-box, only, instead of the steel comb which one there sees producing the music by vibrating after the contact with the pegs, the music here is produced by a lever connected with the comb, as it were. And just as the airs in the music-box can be changed, so those in the belfry can be and are changed—once a year, I think—by altering the relation between the pegs and the hammers.

One of the Impositions of the Day.

Some few days since we received a letter from New York, signed "The American Sewing Machine Co., of 86 Nassau st." requesting us to insert the inclosed advertisement one year, and send bill, at expiration of each quarter, for payment. We replied, giving price for such insertion, that we required cash in advance from strangers who did not furnish us with satisfactory reference. A subsequent letter from them said our terms were satisfactory, and they would refer to J. W. Delamere & Co., 208 Broadway, Delamere, Norton & Co., 102 Nassau st., and to N. A. Niele & Co., importers of watches, 40 Ann st.

We at once forwarded their letter to a friend in New York to make the necessary inquiries. He reports: "J. W. Delamere & Co. are not, nor have they ever been, at 208 Broadway; Delamere, Norton & Co. have never been at 102 Nassau st., nor N. A. Niele & Co. at 40 Ann st. There is not now, nor has there ever been, any such concern as the 'American Sewing Machine Co.,' in the city, or at 86 Nassau st. I have been all through such building as above from basement to attic, on a 'spirit of inquiry.' Not one of the above names are in the New York Directory, but they are in the Dictionary, under the head of 'myth.'"

We publish the above as a warning to our brethren of the press, and to the public. They may be classed with the "Retired clergyman, whose mode of life are nearly run out."—*Mechanic and Inventor.*

A Magnificent State.

Take a map of the United States—a borrowed one is best—and carefully cut out the State of California. Invert the slip and move it over to the Atlantic side, keeping its northern end upon the forty-second parallel, and making its irregular western—now become its eastern—line conform as nearly as possible to the coast—which it will do with tolerable accuracy. The slip will then extend from the north line of Pennsylvania nearly to Savannah, Georgia, into which State its southern end will cut as far as the city of Macon. Having drawn a line round it with a pencil remove it. The experiment is an interesting one, and the result somewhat surprising. You will find that you have enclosed a corner of New York, about half of New Jersey, two-thirds of Pennsylvania, nearly all of Delaware, Maryland, Virginia, North Carolina and South Carolina, and a third of Georgia! We will imagine, if you please, that this portion of the Atlantic seaboard, owing to some political necessity, has been erected into a single State—say the State of Delaware. What a variety of climate the State of Delaware would possess; what an assortment of vegetable productions it would yield; how vast and varied its mineral resources; how manifold its manufacturing possibilities, and how magnificent its scenery! Look at its coast, indented with splendid harbors and cut up with navigable rivers. What a magnificent State—this State of Delaware—its north tawny with wheat, and its south white with cotton! Clearly, it is capable of supporting an immense agricultural, manufacturing and commercial population, and there are splendid sites for great cities. But the main things which smite us with wonder are its select and complete assortment of climates and agricultural products. In this respect it reminds us of California, only the latter is every way inferior to it. Truly, the Man of Delaware hath good reason to be proud of his *habitat*. Alas, for him! this blessed section of the earth's surface has eight names instead of one. Our own, praise God! has but one. We have a trifling advantage of the Man of Delaware—at whom we mock.—*News Letter.*

THE CORNER LOAFER.—The following sketch of a specimen of the corner loafer tribe, taken from the *Daily Saratogian*, of Saratoga, will no doubt be fully indorsed as correct in every respect by all who have come across any of this shiftless, corner-obstructing class:

"That young squirt on the corner, with his hat a little on one side, the stub of a cheap cigar in his mouth, and a stare for every lady that passes—is a loafer. Do you know where he gets his money? His mother earns it for him taking in washing. Pool soul! She thinks her boy will get work soon. He could find work enough to keep him busy fifteen hours a day, if he wanted it. But he is a lazy loafer, and don't want to work. If he gets a place, he shirks, or does his work so poorly that he is soon discharged. He never works for the same man twice. Or, perhaps, he is particular what kind of work he does. He is willing that his mother or sister should sew or wash to earn money for him to spend, but he is a little particular, *he is*, what work he does with his hands. He looks down on that sweaty carpenter who hurries by him, nods condescendingly to his friend, the shoemaker, and sends a whiff of smoke into the eyes of the head-daubed painter, with both hands full of paint pots and brushes. He couldn't borrow ten cents of any one of them. They know he never would pay it. They earn their money. He begs of his mother.—Stylish, boy isn't he?"

MOLTKE.—A remark which the King of Prussia made at the depot at Kaiserslautern characterizes the immense respect he entertains for his Chief-of-Staff, the great Moltke.—He was about to enter the reception room to receive a deputation of citizens, when somebody remarked that Moltke had already entered the train. "So he has got on, has he?" said the King. "Well, then, gentlemen," added he, turning to his suite, "we cannot wait any longer. If he is in his seat, we must get on at once."

The following printed valedictory of a Southern editor is from the *Yazoo* (Miss.) *Democrat*: "I quit the *Democrat* with this issue, because its large increase of subscribers renders it impossible for me to meet all their views in so small a space. I am at the service of any publisher who has a larger paper or fewer subscribers. Exchanges please copy, and send bill to Captain Joe Sublett. HARRY MOSS."

Lode and Placer Claims.

[CONTINUED FROM PAGE 276.]

The following are the instructions issued by Commissioner Wilson on this subject. We have already published the bill referred to.

15th. Proof of citizenship is required. Where the applicant is a corporation, a copy of their charter or certificate of incorporation may be filed in lieu of evidence of citizenship. In case, however, the applicant is an individual or an association of persons unincorporated, affidavits of citizenship or of having filed declaration of intention to become citizens should be filed.

16th. Upon filing these papers, the Register and Receiver will give the same careful examination, and if found to be regular the Register will order the publication of the "Notice" for ninety (90) days in a newspaper published nearest the location of the claim, but, before ordering such publication, the Register will, in future, require the claimant to enter into an agreement with the publisher, to the effect that no claim or demand shall be made against the United States for the payment of such publication, and the Register will decline to order the publication until such written agreement shall have been filed in his office. The cost of the publication of notice will therefore not be estimated by the Surveyors General in future cases.

17th. The Register will also post copies of said "Notice" and "Diagram" in his office for ninety (90) days, and upon forwarding the case to this office will certify that they were posted.

18th. On the expiration of the ninety days, the claimant or his duly authorized agent, must file with the Register his own affidavit supported by that of at least one other person cognizant of the fact, that said "Notice" and "Diagram" were posted in a conspicuous place upon the claim for the period of ninety consecutive days, giving the date of the same. The affidavit of the publisher must also be filed to the effect that the "Notice," a printed copy of which should be attached, was published in his newspaper for ninety days, giving the dates on which such publication commenced and ended, and that he has received payment in full for the same.

19th. These affidavits may be taken before the Register and Receiver or any officer authorized to administer oaths within their district, but if taken before a magistrate without an official seal, his official character must be authenticated under seal by the County Clerk in the usual manner.

20th. If all the proof furnished is satisfactory to the Register and Receiver, and no adverse claim has been filed, those officers will, at the end of the ninety days, so inform the applicant for patent, and the Surveyor General, which last named officer will make an estimate of the cost of surveying and platting the claim, except in case of placer claims on surveyed land where no further survey is required, and when the claimant shall have deposited the amount so estimated with any Assistant United States Treasurer or designated depository in favor of the United States Treasurer to be passed to the credit of the fund created by "individual depositors for surveys of the public lands," and shall have filed with the Surveyor General one of the duplicate certificates of deposit, that officer will order the claim to be surveyed and platting in accordance with the regulations of this office governing mineral surveys, except in cases where the claimant has had a preliminary survey made by the United States Deputy Surveyor, for the purpose of perfecting the diagram and notice posted on the claim, in which case such preliminary survey may be platting and adopted by the Surveyor General for the final survey. Copies of plat and field notes of survey are to be sent to the Register and Receiver and to the General Land Office, the latter accompanied by the certificate of deposit.

21st. The Register and Receiver will examine the returns of the survey, and, if found satisfactory, will allow the entry to be completed at the rate of five dollars per acre, or fractional part of an acre, for lode claims, or two dollars and fifty cents per acre, or fractional part of an acre, for placer claims, and transmit all the papers on their files bearing upon the case to the General Land Office, together with their joint opinion thereon, so that a patent may be issued if all is found regular.

22d. In regard to placer claims on surveyed land, where the claimant applies to enter one hundred and sixty acres in legal subdivisions, no survey and plat of the claim are required; the entry in that case being allowed to be completed at the local land office as soon as satisfactory proof has been made after the expiration of ninety days' notice and publication, provided no adverse claimant has appeared in the meantime.

23d. Where the claimant of a Placer mine desires the subdivision of a quarter section, the service may be performed by county and local surveyors at the expense of the claimant, as required by law.

ADVERSE CLAIMANTS.

24th. The 6th section of the mining Act of July 26th, 1866, provides that "whenever any adverse claimants to any mine, located and claimed as aforesaid, shall appear before the approval of the survey as provided in the third section of this Act, all proceedings shall be stayed until a final settlement and adjudication in the Courts of competent jurisdiction, of the rights of possession to such claim, when a patent may issue as in other cases."

An opposing claimant must file his adverse notice with the Register and Receiver, and in order that it may appear to those officers whether or not the adverse claim is such a one as is contemplated by the said 6th section, they will require the opposing claimant to present his affidavit, setting out in detail the nature of his adverse claim, stating when and how it originated, whether by purchase or by location, the names of all the original locators with a certified copy of the original location from the Mining Recorder's office, and if he claims as a purchaser, an abstract of the title certified by the said Recorder, tracing the title to the possession from the original locators to the claimant, should be furnished.

Such affidavit and accompanying papers will be carefully examined by the Register and Receiver, and if in their judgment, an adverse claim is made out, they will suspend all further action on the application for patent until an adjustment is had in the local Courts; if they find otherwise they will refuse to suspend, but in either event the papers filed both by the applicant for patent, and the adverse claimant, will be referred to this office for review, when the decision of the Register and Receiver will either be affirmed or set aside, and all parties in interest notified of the result.

25th. In the case of Placer claims upon surveyed lands where no survey is required, the adverse claim should appear before the entry is made; but if from any cause such adverse claimant should be unable to appear within the time specified, and should appear before the patent is issued, the Register will nevertheless take his sworn statement, and transmit it to the General Land Office for such action as the Commissioner may deem proper.

26th. When the parties are notified that an adverse claim is made out, it then becomes the duty of the adverse claimant immediately to commence action in Court, and to prosecute the same to final judgment or decree, by which the further proceedings of this office will be governed; yet in default of such suit being instituted within a reasonable time, the original claim will be dealt with as if no adverse interest had been asserted.

You will afford every facility to parties desiring to avail themselves of the privileges accorded by these enactments, and when the cases are completed, promptly report them to this office.

Monthly returns must be made of all entries of lode and Placer claims, with details specifically showing what lands have been so entered.

Copies of both the mining Acts of July 26th, 1866, and July 9th 1870, are herewith appended.

Very respectfully your obedient servant,

JAS. S. WILSON, Commissioner.

To the United States Registers and Receivers

and Surveyors General.

Department of the Interior, August 9th, 1870.

Approved.

J. D. Cox, Secretary.

Destructive Fire.

Our city was visited, on Thursday, by one of the most disastrous conflagrations which has occurred here within the last six or seven years. It was first discovered by officer Hagerty at 9 o'clock in the evening, in the Empire Planing Mills, owned by Miller & Haley, on Fremont st., between Mission and Market. The fire spread with great rapidity through the block, to Beal street, destroying everything on the southern half of the block. Three large mills and nine other buildings were reduced to ruins. The last which was swept away was the extensive Hard Wood and Carriage Trimming establishment of Geo. T. Casbolt & Co. The total loss is about \$350,000. Over 200 men have been thrown out of employment. It is reported that three men lost their lives in vain efforts to save their tools.

A NEW SULPHURET SAVER.—John Pattison, of Nevada, says the *Transcript*, has invented a new sulphuret saver, which has been tried at the Pittsburg mine and works to a charm. It consists of an ordinary square trough, closed at one end, and supplied with a sliding door at the lower end. The pulp from the battery is run through the trough, and as the sulphurets settle at the bottom, the sliding door is raised at the rate of three quarters of an inch per hour, so that as the sulphurets are deposited they are thus held back. The heavier sulphurets all settle at the upper end and the lighter ones at the lower end, while the sand is carried off. The sliding door is raised by means of a wheel and shaft, with a screw running around it. The one tested at the Pittsburg has given an entire satisfaction that another is to be put up.

THE SARATOGA PAPER MILLS had a narrow escape from destruction. All the straw was burned up, but the mill itself was saved by great exertions.

BLOE TIE AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street.

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great tem perance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENYON, GARR & Co. 2v21-3m

"SPOTTED LIKE DOMINOES."—The teeth soon become spotted if every dentition is not removed from them every twenty four hours. To do this effectually, there is nothing like SOZ-DONOR. It literally renders the ena mel impervious and indestructible.

"SPAUDLING'S celebrated Glue, useful and true.

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your Journal is very valuable. No better investment for \$4. Recpt. B. C. B.

77 MARAVILLA COCOA, For Breakfast.—The Globe says: "Various importers and manufacturers have at tempted to attain a reputation for their prepared Coconuts, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an arti cle which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concen tration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Gro cers, of whom also may be had Taylor Brothers Orig inal Homoeopathic Cocoa and Soluble Chocolate. Steam Mills Brick Lane, London. 6v20-ly

SUBSCRIBE FOR THE Best Illustrated Newspaper FOR—

PACIFIC COAST READERS.

The Scientific Press, [ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Home Journal, devoted to Mining, Farming, Mechanic Arts, AND INDUSTRIAL PROGRESS.

Each weekly issue contains 16 pages (size of Harper's Weekly), except our double sheet, published on the first week of each month, which comprises 24 pages. It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent read ers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which can not be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please exam ine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies of the PRESS and illustrated Patent cir culars sent free on receipt of postage stamp.

DEWEY & CO., Publishers and Patent Agents, No. 414 Clay street, San Francisco.

NEVADA AND CALIFORNIA PROCESSES

OF SILVER AND GOLD EXTRACTION,

FOR GENERAL USE, AND ESPECIALLY FOR THE MINING PUBLIC OF CALIFORNIA AND NEVADA,

With full explanations and directions for all metallurg ical operations connected with silver and gold from a preliminary examination of the ore to the final casting of the ingot. Also, a descrip tion of the general metallurgy of silver ores.

BY GUIDO KUSTEL, Mining Engineer and Metallurgist, former manager of the Ophir Works, etc.

Containing 350 quarto pages, and illustrated With accurate Lithographic Engravings. 1863, sold by DEWEY & Co., Publishers SCIENTIFIC PRESS, San Francisco,

As its title indicates, this work gives a wide range of information, applicable to all vein miners and workers in precious metals, affording hints and assistance of ex ceeding value to both the moderately informed and the most expert operator. Once in hand it is held for trusty reference by the owner and highly recommended to others who do not possess it.

Price \$5 (coin) bound in cloth, \$6 bound in leather. Address DEWEY & Co., SCIENTIFIC PRESS Office, San Francisco.

A NEW BOOK FOR MINERS

[Issued July 1870.]

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

BY G. KUSTEL, MINING ENGINEER AND METALLURGIST, Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all kinds of ores."

CONTENTS:

I. INTRODUCTION. Classification of Ores; Important Silver Ores; Differ ences between Real Silver Ores and Arseniferous Ores; Important Combinations; Means of Desulphur ization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is, and How Chlorination is Effected; Means of Separating the Metals from Chlorine.

II. ROASTING OF ORES. A. Chloridizing Roasting; Necessary Amounts of Sul phurets; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roast ing; Means of Destroying Base Metal Chlorides; Steam Decomposers; Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Dif ference in Roasting Processes; In what condition the Metals are after Roasting; Charges in Roasting. B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverber atory Furnaces; Single Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Re volving Hearth Furnace; Ernst's Rotary Furnace; Parke's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimneys and Flues.

III. EXTRACTION OF SILVER BY LIX IVATION. C. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Patena Process; Kiss Process; Patena and Rosner Process; Kustel and Hoffmann Process; Angustin Process; Ziervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD. D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arseniurets. This new book on the treatment of gold and silver ores without quicksilver, is liberally illus trated and crammed full of facts. It gives short and concise descriptions of the various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit by an author whose reputation is unsurpassed in his speciality. Its price, considering its special character and value, is reasonable and small in comparison to the information so well rendered in its crowded pages.

Price \$2.50 coin or \$3 currency, postage free. Printed and Sold by

DEWEY & CO., Publishers and Patent Agents, Scientific Press Office, San Francisco.

The Best Treatise Published. Concentration of Ores

(OF ALL KINDS,) INCLUDING THE CHLORINATION PROCESS

FOR GOLD-BEARING SULPHURETS, ARSENIURETS, AND GOLD AND SILVER ORES GENERALLY.

By GUIDO KUSTEL, MINING ENGINEER AND METALLURGIST, Author of "Nevada and California Process of Silver and Gold Extraction."

With 120 Lithographic Diagrams. Published and sold by DEWEY & CO., Publishers SCIENTIFIC PRESS, San Francisco, 1868.

Heads of Table of Contents.

I. INTRODUCTION.—The Dressing; The Separation; Cleansing and sizing Contrivances; Rotary Sizers, etc. II. REDUCTION.—Reduction of Ores; Description of Batteries; Details of a Battery; Speed, Curve and Order of Lifts; The Discharge of Batteries; The Feeding of Batteries; Reduction by Rolling Mills; Grinding; Pans with Plane Mullers; Pans with Conical Mullers; Pans with Tractory-Conical Mullers; Pans with Per pendicular Mullers. III. CONCENTRATION.—Concentration of Reduced Ore; A Concentration of Ore Grains, (Jigging Stuff); Movable Jiggers; Stationary Jiggers; Continual Jig gers; Rotary Machines; Concentration of Ore Sand; Assorting of Sands; Feeding of Concentrator; Station ery Concentrators; Percussion Table; Oscillating and Shaking Tables; Steady Moving Concentrators. IV. SPECIAL CONCENTRATION.—Concentration of Gold Ores; Concentration of Silver Ores; Concentra tion of Lead and other Ores. V. CHLORINATION.—Extraction of Gold from Sulphurets by chlorination; Assay ditto; Loss of Gold in Roasting; Roasting Furnaces and Operation; Roasting with Salt; Dampening of Roasted ores; Sifting; Pro duction of Chlorine Gas; Lixivation; Precipitating Vat; Precipitation; cost of Process; Remarks; Other methods of Dissolving and Precipitating the Gold from Sulphurets, etc.

This work is unequalled by any other published, em bracing the subjects treated. Its authority is highly es teemed and regarded by its readers. Containing as it does, much essential information to the Miner, Mill man, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and in structions rendered more clearly by being clearly rendered together and in simple order. Price, postage paid, \$7.50, in gold or its equivalent.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, OR Enmeled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Fran cisco. Every picture warranted to give satisfaction. 1v15-5m B. F. TOWLAND.

NOVELTY MILL AND GRAIN SEPARATOR.

THE undersigned having purchased of the Patentees, WILTS & SWIFT, of Hndson, Michigan, their right to this mill, Patented June 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS and GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their respective compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 31, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare its perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 16 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL.

For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

SAN FRANCISCO.

Varney's Patent Amalgamator.

These Machines Stand Unrivalled.

For rapidly pulverizing and amalgamating ore, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:
The pan being filled the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

SALT LAKE CITY Oct. 11, 1870.—Messrs. Dewey & Co.—I wouldn't care or the missing number of the SCIENTIFIC PRESS particularly if I did not keep them on file. I think a great deal of it and consider it worth keeping. I never invested four dollars to better advantage in my life.

Respectfully Yrs, A. G. B.

PATENTEES
Who have failed in their efforts to dispose of their rights are invited to consult us, either personally or by mail, free of charge. Many valuable inventions are lying dormant, for want of proper management, that might realize a fortune for their owners, if placed in the hands of competent agents, and brought to the attention of capitalists. We accept only those showing decided merit, as no others can be negotiated. A candid opinion can therefore be relied upon. Commissions dependent upon success. Inclose stamp for full information.
References on application. **E. E. ROBERTS & CO.,**
Consulting Engineers, 15 Wall street, New York.

WIESTER & CO.,
PATENT BROKERS,
No. 314 Bush Street, San Francisco.
PATENTS BOUGHT AND SOLD ON COMMISSION.
Barnes' Thill Holder.

This coupling can be attached in a few minutes and it is absolutely certain that it will not release itself while the horse is attached. It is durable, noiseless, ingood taste, and in short, a perfect Thill Coupling in every respect. The best recommendation that we can send out is the Coupling itself. A full set will be sent to any one for \$5, and the money will be returned if they are not liked. Shop Rights for sale.

Dennis Combination Gridiron.
No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.
This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.
Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. These men can put up six hundred yards per day. You men who are idle, why hang about this city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.
This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.
A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!
By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest bit is used and the horse's mouth cannot be injured.
No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see this Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.
The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.
We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East.
We invite manufacturers and others, to call at our office and make their own investigations.
WIESTER & CO.,
314 Bush Street, San Francisco.

TO PACIFIC COAST INVENTORS.
DEWEY & CO.
San Francisco.
Scientific Press
U. S. & Foreign
PATENT AGENCY.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit honest patronage.

Saving of Time.
In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving at least several weeks time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this Coast several months sooner than can generally be done, through agents in the East, without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

Dangers of Delay.
Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is \$25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat.....	10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 yrs and 6 mos.....	10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	30
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Advancing Cases.
If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be persistently argued before the Examiner, and if possible the decision reversed.

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

DEWEY & CO.,
Publishers and Patent Agents, Scientific Press Office, San Francisco.

KUSTEL'S NEW BOOK.—We have received from the publishers, Dewey & Co., a copy of Kustel's work Roasting of Gold and Silver Ores. It abounds in valuable information upon the subjects which it treats, and no person engaged in mining should be without it. Mr. Kustel's writings are based upon actual accomplishments with the ores of the Pacific slope, are not mere theoretical propositions. Sold at the Scientific Press office S. F. Price \$2.50 coin, post paid.—Marysville Appeal.

Sheffield Scientific School
Of Yale College, New Haven, Conn.
This department of Yale College, instituted in 1840, and endowed with the National Land Grant in 1866, furnishes advanced instruction in the various branches of Mathematical, Physical, and Natural Science.
The School is under the direction of the President of the College, a Board of thirteen Professors in different specialties, and six assistant instructors.
Regular courses of study, leading to the degree of Bachelor of Philosophy, conferred by Yale College, are arranged as follows: 1—CHEMISTRY and MINERALOGY. 2—CIVIL ENGINEERING. 3—MECHANICAL ENGINEERING. 4—MINING ENGINEERING and METALLURGY. 5—AGRICULTURE. 6—NATURAL HISTORY and GEOLOGY. and 7—SELECT COURSE.
Advanced students are also admitted to optional courses, and already College graduates are received as candidates for the degree of Doctor of Philosophy.
Tuition, \$125 per year of forty weeks.
The Libraries, Museums, Laboratories and Apparatus accessible to students, are varied and extensive.
For copies of the Annual Circular and Report, letter may be addressed to the "Secretary of the Sheffield Scientific School," New Haven, Conn. 7v18-ly16p

Narrow Gauge Railways.

This subject seems gradually to be attracting on our coast the attention which it deserves, and is being constantly handled in the papers here and there. We have already spoken at length on it, but have by no means said all which ought to be uttered. We believe that the system can be introduced much more extensively and with much more beneficial results than is commonly thought. We incline strongly to the opinion that a system of narrow gauge roads could be introduced in our Western States and Territories with immense results.

Mr. Robert F. Fairlie read a paper at the late meeting of the British Association, to show to some extent in what degree the cost is affected by the gauge, and how it would be possible to profitably extend roads to thinly peopled districts. It has been assumed that lines of narrower gauge than 4 ft. 8 1/2 in. would be limited both in carrying capacity and speed of trains. If it is necessary to run trains at the rate of 60 or 70 miles an hour, the argument so far is strongly for the broader gauge, but with bogie engines 35 to 40 miles can be obtained on a 3 foot gauge, about as high a speed as we usually need in a new country. Mr. Fairlie asserts that fully as heavy merchandise trains can be run at the same speed with such engines and gauge, as are now taken on the broad gauge in England, and on far lighter rails which will be fairly worn out instead of crushed and ground out; and this will apply equally well here.

The proportion of non-paying to paying weight in passenger trains in England is as much as 29 to 1, and in goods trains as 7 to 1. On the Festiniog Railway with its gauge of 1 ft. 11 1/2 in., wagons weighing 12 cwt. frequently carry loads of over 3 1/2 tons at a speed of 12 miles an hour. Thus the cars carry as much as six times their own weight, while on ordinary roads the cars carry only twice their own weight. This shows how the amount of dead weight is dependent on the gauge. And this denotes also the difference in the wear and tear of the rails.

Mr. Fairlie attempts to prove by figures (and we have nowhere seen his attempt called a failure) that, if the 3 ft. gauge should be substituted for the broader one of the London and North Western Railway (selected as an example on account of

its excellent management), the present goods traffic could be hauled at one half the present cost, with half the present motive power and half the tennage. He shows that with a traffic requiring the same number and weight of trains now worked, the 3 ft. gauge would carry, without increasing the cost of haulage by a penny, a paying load of 25 million of tons as against the 10 millions now carried. He proceeds further to apply the case to the East Indian Railway, in India, which has a gauge of 5 ft. 6 in. He shows that the proportion here is 5 tons of dead to 1 ton of paying load, and asserts that this proportion on a 3 ft. gauge would be only 1 1/4 to 1, instead of 5 to 1. Let us imagine, he says, he saving which this change would effect

row gauge has been adopted also in other countries. It is time that we go-ahead people of the Pacific slope should take up the matter. And we are happy to say that, from several inquiries and communications sent us, we have some reason to believe that there is some prospect of the subject's getting a good ventilation on our coast.

We give in this connection, an illustration of one of the engines employed on the new famous Festiniog Railway in Wales, (from the *American Artizan*), which will be noticed as being a little giant of peculiar construction, with piston and cylinder arranged between the wheels. Another engine on this road, called the "Little Wonder" weighs but five tons, has hauled a load of 101 tons, made up of a train of a

it as the duty of every man in the old country to assist these of the new by pointing out how they may benefit by our dear-bought experience, and may avoid the pitfalls into which only too many of our railway shareholders have fallen.

TEHUANTEPEC SHIP CANAL.—The expedition organized by the Government for the survey of this canal was to have sailed on the 10th. Mr. J. J. Williams has estimated the value of the trade, which must pass through the canal when completed, (and he regards it as a perfectly feasible undertaking) at over 451 million dollars, including value of ships and cargoes.

LECTURES.—Dr. C. F. Winslow lectured last Saturday evening on the "Theories of Creation" before the Mechanics' Institute. The subject was handled, we are told, in a most interesting and instructive manner, and with great ability. Sickness necessitated the absence of the editor of this paper, whose duty and pleasure it would otherwise have been to have attended.

We are glad to see that the Young Men's Christian Association are moving so well in the matter of the popular lectures, by securing excellent speakers and throwing the course open to the public at a very low price. The second lecture of the course was delivered on Tuesday by Prof. E. S. Carr on "the Influence of Physical Causes on Human Development."

Prof. Carr is remarkably fortunate in his treatment of subjects for the people. We hope that these and other courses will awaken a strong lecture-going spirit in our city, for we are strong believers in this method of education.

A FEARFUL ACCIDENT occurred lately at Mineral Hill, Nevada, at the Stetefeldt furnace. It would appear that the apparatus for conveying cold water around the hopper (to keep it cool) must have become clogged in some way, so that this water was heated until it generated steam, and an explosion followed which must have thrown over the feeding arrangement. Two men were busied at the top of the furnace and one, in some manner, fell down the hot shaft, and was drawn out below. Of course he was fatally injured: the only wonder is that he was not killed outright. He is said to have lived, however, four hours, but his flesh was terribly burned and presented a sickening sight. The accident is one which never would be expected to happen. The name of the deceased was William Dreary; the survivor was Joseph Pringle.

NARROW GAUGE ROADS—THE FESTINIOG RAILWAY IN WALES.

in fuel alone; considering that less than one fourth of the tonnage now hauled would afford precisely the same accommodation to the traffic which now exists, and would produce the same paying results.

We hear from all parts of our great West demands for railroads. But with the broad gauge system, either immense subsidies must be granted, whereat many grumble, or immense districts must be left out in the cold. But if the first cost of building the railways can be reduced one-half, and if the cost of maintaining these roads can be cut down in the same proportion by the introduction of a system which would afford the same accommodations for traffic, why should we delay to take steps in the matter? The Government of Russia, anxious to extend the railroad facilities of that country, sent a number of the most scientific men of the Empire to Wales to investigate the matter of the narrow gauge. The result is that a railway is to be built on the new system, which has also been adopted for some of the old lines. A nar-

quarter of a mile in length—so long that there were parts of the road on which it ran on no fewer than *five reverse curves*—and has attained frequently a speed of thirty-five miles an hour.

We can, perhaps, do no better than to conclude our article with one of Mr. Fairlie's paragraphs. That gentleman says: In moderately temperate climates, gauges of 2 ft. 6 in. will be found ample for any traffic in any part of the world, and will sustain a speed of 30 miles an hour; while 3 ft. is sufficient for either very hot or very cold climates, and will sustain a speed of 40 miles an hour. Railways can be made cheaply and at the same time, to be thoroughly efficient, and those who aver to the contrary are, in fact, enemies to progress and civilization. There is no country too poor to have railways sufficient for its requirements; and railways furnish the cheapest possible mode of transport, when they are not horne down by the results of incompetence and extravagance which we so often see associated together. I regard

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Nevada County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Grass Valley

Contains (together with its environs) about 7,500 inhabitants. Its mines are among the best in the State—certainly the most of them within the same area—and the most extensively worked.

The Hope Gravel mine, $\frac{3}{4}$ of a mile S. W. of town, is owned in San Francisco. There are 3,000 shares, the controlling interest of which is held by Wm. H. Sharp, atty. of S. F. Geo. Bower is Superintendent. This is a deep channel blue gravel lead, but the claim has been badly (or unluckily) managed for some two years back, the company having spent upwards of \$100,000 upon it. Lately under the management of its present Supt., it has been paying not only well but fabulously! A few weeks since, while I was on a visit to this mine, the men at work below got so excited over what was in sight, that they filled their hands and left to inform the Supt., who went down, and then reported \$25,000 in sight. The channel runs east and west; the width averages 100 feet; the pay gravel is $2\frac{1}{2}$ ft. deep over the bed-rock. They have a shaft down 250 ft., splendid hoisting works, and work 25 men. Before this big strike for some time they were averaging \$18 per day to the man.

The Empire Mill & M. Co.'s works (which were burned Sept. 20th, and suffered a loss of \$160,000, with only \$40,000 insurance upon them) are situated about one mile S. E. of Grass Valley, and are owned principally in S. F. J. F. Nesmith is Supt. and Wm. Clift underground foreman. The claim, 1,600 ft. in length, is secured by U. S. Patent. The shaft is down 960 ft. with 10 levels. They worked 68 men. The hoisting works and mill were the finest in the State; the mill had 30 stamps and reduced 40 tons of rock every 24 hours. I understand the reconstructing of these works is being pushed forward energetically.

The Eureka G. M. Co., have their shaft down 730 ft., with six levels. Their mill has 30 stamps, crushing 66 tons per day (24 hours). The rock averages \$34 per ton the year round. They have 4 engines,—one 16-inch in mill, two 12-inch on the mine, and one small one driving a Varney & Rix rock breaker. They concentrate all their own sulphurets by Paine & Stevens' Concentrator, and have Chlorination works of their own. The sulphurets average about \$200 per ton. The length of Eureka proper is 3,700 ft., the balance of 1,700 ft. having been purchased of the Roanoke lead. The vein averages three feet. The last clean up, in September, after 12 days' run, was \$28,176 without sulphurets. The mill and hoisting works are lighted by "Pneumatic" gas. The works for this purpose, I understand, were erected by the Pacific Pneumatic Gas Company and have more than answered all expectations. The monthly cost is no more than it was for coal oil when lamps with their miserable lights were used. In the breakage of glass there is a further saving, and a greater in the wages of the man formerly employed to fill, clean and trim them. Indeed this last item alone cost nearly as much as gas does.

But there is another and unexpected saving behind all these. It is well known that oil is a miserable article in a quartz mill. It steals gold, it seduces quicksilver. Let a little get into the pulp (and with oil lamps you cannot prevent some from getting in) and so much quicksilver loses its amalgamating power and a certain amount of fine free gold goes over into tailings, to be wholly lost, or at best to be saved by double labor. Hence the value of gas light in quartz mills passes far beyond the mere improvement of light or saving in the cost of preparing it.

The North Star is $2\frac{1}{2}$ miles South of G. V. This Co. own 10 separate ledges, from 120 feet to 1,250 in length each. D. Hoyt is Supt. They have a 24-stamp mill, and crush 36 tons of ore per day; a splendid hoisting works with an incline shaft down 1,300 ft. on an angle of 22 deg.; are now working on the 9th level, and employ 120 men. Thos. Lancy is day foreman and Mr. Beumallek underground foreman. The principal stock is owned in S. F. The Green Mountain Co., working the Green-horn ledge on Osborn Hill, after some up's and down's, are now making it pay. Since the commencement, they have taken out between \$20,000 and \$25,000.

The California Sewing Machine factory at Grass Valley, Sawdon & Gray, proprietors, employs six men and turns out three machines per week at present; but as they are creating a considerable demand, more force will soon be put out. The principle is a plain crank and eccentric engine motion. Success to them, and all other manufacturing interests in the State; they are just what we need. In my next, at the request of many miners, I will say something about the Diamond Drill.

L. P. Mc.

Iron Sponge in Amalgamation of Silver.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

In my adaptation of the Fonda process to the reduction of cuprous silver ores, I find the use of iron sponge economical; and in the treatment of roasted ore in barrels, it would be equally advantageous. By rapidly reducing the silver chloride, the time of treatment would be much shortened, and a smaller quantity of scrap iron would be required; hence the wear of the barrels would be lessened. Scrap iron would only be necessary from the difficulty of knowing just the quantity of sponge requisite. If, however, the latter be used in positive excess, scrap iron may be dispensed with.

If copper and lead chlorides are present in the ore, they will be reduced, to a certain extent, but unless the sponge be in great excess, they will, in great part, be redissolved by reduction of silver chloride.

For my small operations I make the sponge in crucibles made from quicksilver flasks. Finely pulverized iron ore is mixed with one tenth its weight of pulverized charcoal (not too fine) and exposed in a wind furnace to a red heat for several hours. Bog iron ore is excellent for the purpose, owing to its porosity.

For large operations, the sponge may be made in a reverberatory furnace, suitably constructed, and managed with a view to the fact, that the result desired is the reverse of that in the roasting of silver ores, that is, de-oxydation instead of oxydation. I commend the subject to the consideration of parties working by the Freiberg process. C. H. A.

All About Montana.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Cedar Creek Mines—Conclusion.

I have noticed in my letter some (but not all) of the few claims which are paying well, and have stated the facts as I have been told them here. I think that there are many good claims which will yield handsome returns, although, as is usually the case, altogether too glowing accounts have been spread abroad concerning the camp. On the other hand, many have come here with extravagant hopes, have been disappointed and have gone away and given too gloomy a description. Everybody cannot strike it rich immediately, even if great wealth is at hand.

It is to the deep ground that the place must look for its permanent success. Up at Forest City the claims are down from 10 to 50 feet. From "50 below" down to Cedar Junction, shafts are sunk much deeper and a few have reached pay. Below "68 below" the creek breaks off deep, and from that point down for about three miles the claims are consolidated, generally 2 to 5 going together, and are being opened with drain tunnels and pumps. Good prospects have been obtained in places and the miners all express great confidence. The ground is from 25 to 40 feet deep. When a shaft gets some 6 feet down, the water gives great trouble and tunnels must be run in, often for a considerable distance. A. J. Simmons & Co., owing from 88 to 95 (inclusive) below, are running a large drain tunnel, commenced (about May 1st) half a mile below their claims. They have struck pay in the gravel, but have not reached bed-rock. The work is slow, but conducted systematically and energetically.

I certainly wish the miners all success. If any one deserves good fortune, it is the energetic, but too often poor, prospector. Leaving the comforts of home and the society of friends, he wanders about new fields, suffering hardships and undergoing toils, the mere recital of which would frighten the common man. The most persevering and enduring of men, opening up ever fresh regions for others, venturing where the boldest hunter of romance would turn aside, the fore-runner of civilization, and too often the only one to derive no benefit from his labor,—who can wish anything but the best for that character peculiar to our coast,—the American prospector.

Back again I go to Superior City, whence I have the opportunity of riding on horseback, if I wish, to Walla Walla over the famous Mulvey wagon road, impassable, I am told, on account of its bad condition, to wagons, but traversed by horsemen and pack trains. But I shall retrace my steps to Deer Lodge.

Deer Lodge.

This flourishing county seat, located in the

heantful Deer Lodge Valley, show many signs of increasing prosperity. One of these is the number of new buildings going up. That just erected by the Masonic lodge is a nice structure which has cost some \$8,000. A fine hotel, the Scott House, kept by the enterprising and gentlemanly Mr. Scott, is quite an important feature of the place. Wells, Fargo & Co., have an office here. The U. S. Government is building a large penitentiary for the accommodation of a certain class of free lodgers. This is located about half a mile outside the city. The contractor for the building is Mr. Geo. McBurney, a gentleman who has in the course of a long practical life achieved a high reputation. The iron work is furnished by Mr. Alex. Kemp of Helena. The General Superintendent is Dr. A. H. Mitchell.

The left wing of the building is to be about 70x40 feet, 3 stories high and with 14 cells, 6x8 feet, built of brick. The total number of cells is to be 42, but the present contract calls only for 14. The granite used is found 10 miles from here and the rubble stone for the walls 4 miles off. The roof will have dormer windows. The work was commenced May 20th. The cost is estimated at \$39,000. Fifty thousand feet of lumber and two hundred thousand bricks are used.

There are two papers published at this place. The *New North West* (daily and weekly) is a fine, well conducted sheet, well printed and well edited, and altogether a credit to the place. The *Independent* (weekly) is also an excellent publication which deservedly has a large circulation.

While in this city I visited the manufacturing establishment of Mr. John O'Neil. This gentleman started in three years ago, and by his energy and ability has built up a large business. He manufactures articles needed at all stages of life, literally: cradles for the babes; chairs, lounges, bedsteads, furniture of all kinds for older married and unmarried persons; and even coffins for the dead. He has now eight men employed, and last week, he so told me, turned out over \$1,000 worth of work. His machinery was made here and is adapted for turning, planing, finishing, etc., all kinds of woodwork. His workmanship is excellent and thorough, and he is himself of the proper character to deserve and earn the highest success. W. H. M.

[TO BE CONTINUED.]

The Origin of Life.

[CONTINUED FROM PAGE 232.]

At this time, Cagniard de la Tour made a remarkable discovery,—that common yeast is a vast accumulation of minute plants. Fermentation in the manufacture of wine or beer is always accompanied by the rapid growth and increase of these. So far it is similar to petrification of ordinary animal or vegetable matter, and the suggestion was obvious that organisms were somehow the causes of both fermentation and putrefaction. Chemists at first laughed at the idea, but, in 1843, Helmholtz reduced the matter to a test by a conclusive method. He separated a putrefying, or a fermenting liquid from one which was merely capable of putrefying, or fermenting, by a membrane which allowed the fluids to pass through and intermix, but stopped the solids. Now while the putrescible, or the fermentible, liquids became impregnated with the results of putrefaction or fermentation going on at the other side of the membrane, they neither putrefied (in the ordinary way) nor fermented, nor generated any organisms which abounded in the other liquids. This showed that that which excites fermentation and putrefaction, and at the same time gives rise to living forms in a fermentable or putrescible fluid, is not a gas nor a diffusible fluid; therefore it is either a colloid or a matter divided into very minute solid particles.

This matter was cleared up by Schroeder and Dusch, in 1854 and 1859, who found that all of the putrefiable materials which they used (except milk and the yolk of eggs) an infusion boiled, and then allowed to come in contact with no air but such as had been filtered through cotton-wood, neither putrefied nor fermented, nor developed living forms. It is hard to imagine what the fine sieve formed by the cotton wool could have stopped except minute solid particles. Still the evidence was incomplete until it had been positively shown, first, that ordinary air does contain such particles; and, secondly, that filtration through cotton-wool arrests these and allows only physically pure air to pass. But within the last year Prof. Tyndall's remarkable experiments have demonstrated this;—have shown that common air is no better than a sort of stir-about of excessively minute solid particles, which are almost wholly destructible by heat, and are strained off, and the air rendered optically pure, by being passed through cotton wool. And M. Pasteur found in the cotton wool, used as a strainer, microscopic germs, which gave rise to living forms when sown in a proper solution; while he showed that the incapacity of the air to give rise to life, was not due to any occult change caused by the wool, by proving that this last might be dispensed with altogether. He drew the neck of his flask into a tube and bent it downward, boiled the contained fluid and heated the tube sufficiently to destroy any germs in the air which enters as the fluid cools. No life will now appear in the flask. For contact between the germless air and germ-holding atmosphere occurs only in the tube, and as there are no currents and the germs cannot fall upwards, these cannot reach the interior of the flask.

So much for the history of the progress of Redi's great doctrine of no life without ante-

cedent life, which appears to me to have had altogether the best of the dispute.

Redi offered another problem,—whether living things exist which produce offspring of a totally different character from themselves; and as regards this the researches of two centuries have led to a different result. In respect to grubs found in galls, tape-worms, bladder-worms and flukes, every such parasite has been traced to an egg derived from a parent actually and potentially like itself; and the tendency of inquiries elsewhere has been in the same direction. A plant may throw off bulbs, but these, sooner or later, give rise to seeds or spores, which develop into the original form. But pathology, on the other hand, offers some remarkable approximations to the affirmative answer to this problem. It has been long known that galls in plants and tumors in cattle are caused by eggs laid by insects; that mere pressure on the skin will give rise to corns. Now the gall, the tumor and the corn are parts of the living body which have become to a certain extent independent organisms. From such innocent production as corns and warts there are all gradations to the serious tumors which, by their mere size and the mechanical obstruction they cause, destroy the organism out of which they are developed; while, finally, the terrible cancer has acquired powers of reproduction and multiplication, and is only morphologically distinguished from the parasitic worm, the life of which is neither more nor less closely bound up with that of the infested organism.

If there were a kind of diseased structure whose tissues were capable of maintaining an independent existence out of the body, it seems to me that the shadowy boundary between morbid growth and the generation of foreign offspring would be effaced. And I am inclined to think that the progress of discovery has almost brought us to this point already.

You are all familiar with what happens in vaccination. A minute cut is made in the skin and an infinitesimal quantity of vaccine matter is inserted. Soon a vesicle appears distended by a fluid a hundred or a thousand fold that originally inserted. Experiments have proved that the active element is this, in non-diffusible and consists of minute particles exceeding 1-20,000 of an inch in diameter. Similar experiments have proved that the diseases, sheep-pox and glanders, are also dependent for their existence and propagation upon minute living solid particles called *microzymes*, which, moreover, explain the contagiousness of the terrible diseases. And now arises the question whether these *microzymes* arise by the development of existing germs, or as the result of a modification of the tissues of the body,—a most important practical question. A parasite may be stamped out by destroying its germs; a pathological product can be annihilated only by removing the conditions which give rise to it.

I think this problem will have to be solved for each zymotic disease separately, for analogy cuts two ways. But as I have dwelt on the analogies in favor of one side, I must now speak of those in favor of the other,—the generation of life from life.

It is a well established fact that certain diseases, both of plants and animals, which have all the characteristics of contagious and infectious epidemics, are caused by minute organisms. This is the case of smut of wheat and the potato-disease. Insects are wonderfully liable to such diseases caused by microscopic fungi. In autumn it is not uncommon to see flies motionless on the window pane, with a sort of magic circle in white drawn around them, which consists of innumerable spores thrown off in all directions by a minute fungus, whose spore-forming filaments stand out like a pile of velvet from the fly. These filaments are connected with others which fill the fly's body, having eaten away the viscera. A spore falling on a healthy fly, germinates, sends out a process which bores its way through the fly's skin and gives off minute corpuscles which float in the blood. These last multiply and strengthen into filaments at the expense of the fly's existence, and when they have killed the victim, grow out of his body and give out spores.

A most terrible disease of the silkworm is the Pebrine. The gravity of the injury done by it may be denoted by a few facts. In 1853, the annual production of French sericulture was estimated to amount to 1-10 of that of the whole world, and was valued at \$23,000,000. The city of Lyons is built upon silk. But this disease reduced the silk crop in 1856 to $\frac{1}{2}$ that of 1853, and up to within the last year or two it has never attained half the yield of 1853, and this means poverty and misery to a vast population. It is now certain that this Pebrine is the effect of the growth and multiplication of minute bodies in the blood of the silkworm. Mr. Pasteur examined the subject and came to the conclusion that these bodies came from germs in the ordinary way, and, guided by his theory, devised a method of extirpating the disease which has been extremely successful whenever properly carried out.

There can be no reason, then, for doubting that many contagious and infectious diseases of insects are caused by minute organisms produced by existing germs; and there is no reason that I know of for believing that this may not apply to the highest animals, including man. Indeed, striking evidences of the truth of this have been adduced, and Prof. Lister's publications seem to prove almost that, in the hospitals, the deadly consequences of wounds are due to the importation of minute organisms into these wounds, and it would seem that the surgeon who saves the most lives will be he who best works out the consequences of the hypothesis of Redi.

Mechanical Progress.

LATEST IMPROVEMENT IN THE CARBON PROCESS.—Mr. Joseph Albert, of Munich, is the author. The *American Chemist* describes it as follows:—"A piece of plate glass, after being cleaned, is flowed with a mixture of albumen, gelatine, and bichromate of ammonia, and placed in a horizontal position to dry; when dry it is laid upon a piece of black velvet, with the coated side down, and exposed for a short time to the light from the side upon which there is no film. The plate is then removed to the dark room, and immersed in cold water for half an hour, or until all traces of bichromate are removed. The object of placing the glass, during the exposure, upon black velvet is to absorb the penetrating rays as much as possible, so that the coating of gelatine may retain adhesive properties sufficient to secure the second film of gelatine firmly attached. We have thus far obtained upon the glass a coating of gelatine firmly attached and rendered insoluble in warm water, as a foundation for the second coating, which consists of isinglass, gelatine, and bichromate of ammonia. This is then dried and exposed to the light, under a negative, in a pressure frame, as in the ordinary photographic process; the action of the light is watched from the back, and the plate removed at the proper moment. It is then washed to remove the unchanged chromates, the film hardened with chrome-alum, chlorino-water, or any other coagulating material, and set aside to dry. When dry it is printed from, as with a lithograph, in a press adapted for the purpose. As many as 2,000 impressions have been made from a single plate, without any perceptible difference in their quality."

CHROMATIC PRINTING PRESS.—The following is from the *Scientific American's* report of the American Institute Fair:—"We noticed a novel and ingenious printing press, call the 'Chromatic' press, which prints in three colors with a single impression, and does its work as rapidly as any platen press can print in single color. The surface of the inking cylinder is divided into three equal parts, which are supplied with adjustable sectors (or color strips) of various sizes, to correspond in width with any line or part of line of type. Each part is supplied with a color from one of the distributing rollers. The cylinder has lines struck on its surface which are numbered to correspond with lines and numbers on the chase, making it simple work for the pressman to set his sectors to correspond to the lines of the type which he may wish to print in colors. Thus, having the sectors arranged, they receive their proper colors and transfer them to the type rollers, corresponding in width and position with the lines of the type to be printed. Within one minute the press may be changed from two or three colors to one, by throwing two polished shells or half cylinders over the color arrangements, which enables the pressman, if he desires, to use three times the amount of distribution and inking surface that he now has in any one-color job press."

DEPOSITION OF GOLD ON GLASS.—Böttger has modified Wernicke's process for throwing down gold on glass as follows: He prepares the soda solution by dissolving 6 grammes caustic soda in 100 c. c. water; the reducing fluid, to be made when washed, by dissolving 2 grammes common starch sugar (glucose) in 24 grammes distilled water, and adding 24 c. c. alcohol of 80 per cent., 24 c. c. Aldehyd of 0.870 specific gravity; neutral solution of chloride of gold, one gramme of gold in 1200 c. c. water. Four volumes of the gold solution are mixed with one vol. soda solution and 1-16 vol. of the reducing liquid, and the liquid rapidly poured into the hollow glass globe to be plated. Five minutes is sufficient to insure the deposit of a thin film of gold, but it is better to allow more time. Flat plates of glass can be laid upon the surface of the liquid, as in the silvering process; the surfaces of the glass should be carefully cleaned with soda and alcohol, and not with acids. The greater part of the gold is thrown down in flocculi, and can be recovered for subsequent use—the amount deposited upon the glass being very small. The mirrors are to be well washed and dried in the air. Where the baths are heated, the deposition of gold takes place more rapidly, but not so fine; it is better to keep the temperature below 140° F., and to allow the metal coating to form slowly.—*Jour. Applied Chemistry.*

NOVEL ROAD ENGINE.—A road engine, recently invented by D. J. Lake, of Chicago, is thus described by the *Times* of that city:—"In an ordinary locomotive, the steam power is communicated directly to the crank of the driving wheels. In Mr. Lake's machine, when desirable, the motion can first be communicated to balance wheels. When these wheels have reached a very high rate of speed, the power can be communicated by a 'clutch' to the driving wheels. Suppose the vehicle in a place where it requires extra force to start it. By applying the power at once no movement is effected; but by storing it up in the balance wheels, and then communicating it to the drivers, one gets the same benefit that he would by getting a heavy wagon under rapid motion just before running it up an incline. The machine has two sets of driving-wheels, one considerably smaller than the other. By a screw, either set can be raised, leaving the other on the ground. In hauling heavy loads, the small wheels will be used, and in excursions, where there is no great weight to be hauled, rapidity is secured by the employment of the large drivers. A pump and air-chamber furnish a complete apparatus for throwing water; while a band wheel allows the transfer of power to a threshing machine, or any other article of the kind. The engine weighs about three tons, moves without difficulty, and guides as easily as a well-trained horse."

"SWITCH" FOR GALVANIC BATTERIES.—The *American Artisan* for Oct 12th, describes a recently patented invention, by means of which two separate batteries may be brought into action in turn, without any interruption in the continuity of the circuit, and each in turn thus allowed time to recover its activity. An upright armature called the "switch," is so pivoted at the lower end, that the upper end may move to and fro between two set screws. To this switch is attached a small local battery and electro-magnet, having a rotary circuit breaker operated by clock-work. So long as the circuit is complete, the switch is drawn by the magnet against one set screw, completing the circuit of one of the main batteries; while so long as it remains broken, the switch is kept by a spring against the other set screw, completing the circuit of the other. Thus the effective time of the batteries being known, and the clock set accordingly, they are in this way automatically "spelled."

ELASTIC TIRES.—The *London Engineering* describes a new form of elastic tire, consisting of india-rubber segments attached to iron plates by a patented process,—the nature of which is not intimated,—these plates being then bolted to the wheel tire. We quote:—"The front pair of driving wheels of the engine are 3 ft. 6 in. in diameter, and are fitted with india-rubber segments 12 in. long, 4 in. wide, and 3 in. thick. The rear pair of driving wheels are 5 ft. in diameter, and are fitted with india-rubber segments 12 in. long, 6 in. wide, and 3 in. thick. The rubber is firmly attached to $\frac{1}{2}$ in. steel plates, which are bolted on to the $\frac{1}{2}$ in. wrought-iron tires, the segments being still further secured by $\frac{1}{2}$ in. wrought-iron rings placed on each side of the wheel. * * * The great advantage of Messrs. Sterne's method of attaching the india-rubber in segments over the solid ring is, that if a segment gets damaged it is easily and quickly removed and replaced by a spare segment at a moderate cost. The motion of the engine during the run was easy, and the india-rubber readily impressed itself into the inequalities of the roadways. Traction engines with their wheels thus tired will prove useful under special local circumstances, such for instances, as where they have to traverse paved or very uneven roads. But here, to our mind, the advantage of rubber tired wheels ceases, and we believe that the engine would work as well without as with this addition, and that in most cases the 130% or 140% which these appliances cost, could be more profitably expended on the engine in other ways."

ALLOY OF COPPER AND MANGANESE.—A Connecticut man has patented an alloy made from copper and black oxide of manganese, which "presents a beautiful white appearance, is malleable, ductile, and admirably adapted as a substitute for German silver, and as the basis for silver plate."

Scientific Progress.

TEMPERATURE OF THE SUN.—We take the following from Prof. Roscoe's opening address before Section B., of the British Association at the late meeting: "Starting from the fact of the eruptive nature of a certain class of solar protuberances, Zöllner thinks that the extraordinary rapidity with which these red flames shoot forth proves that the hydrogen of which they are mainly composed must have burst out from under great pressure; and if so, the hydrogen must have been confined by a zone or layer of liquid from which it breaks loose. Assuming the existence of such a layer of incandescent liquid, then applying to the problem the principles and methods of the mechanical theory of gases, and placing in his formulae the data of pressure and rate of motion as observed by Lockyer on the sun's surface, Zöllner arrives at the conclusion that the difference of pressure needed to produce an explosion capable of projecting a prominence to the height of 3.0 minutes above the sun's surface, a height not unfrequently noticed, is 4,070,000 atmospheres. This enormous pressure is attained at a depth of 139 geographical miles under the sun's surface, or at that of 1-658th part of the sun's semi-diameter. In order to produce this gigantic pressure the difference in temperature between the inclosed hydrogen and that existing in the solar atmosphere amounts to 74,910 deg. Cent. In a similar way Zöllner calculates the approximate absolute temperature of the sun's atmosphere, which he finds to be 27,700 deg. Cent.—a temperature about eight times as high as that given by Bunsen for the oxyhydrogen flame, and one at which iron must exist in a permanently gaseous form."

SULPHURIC ACID FROM GYPSUM.—A hundred weight of gypsum contains about 57 lbs. of sulphuric acid. H. Reinsch states that if there be mixed two parts of pulverized gypsum with one part of carbonate of ammonia, and water poured over this mixture, complete decomposition of the gypsum ensues, sulphate of ammonia is formed, and carbonate of lime. The sulphate of ammonia is, in its turn, decomposed by means of common salt, the result being the formation of sulphate of soda and chloride of ammonium, which can again be converted into carbonate of ammonia by means of chalk.

DISSIPATION OF ENERGY.—"One of the most remarkable results of the progress of molecular science is the light it has thrown on the nature of irreversible processes,—processes, that is, which always tend towards, and never away from, a certain limiting state. Thus if two gases be put into the same vessel they become mixed, and the mixture tends continually to become more uniform. If two unequally heated portions of the same gas are put into the vessel, something of the kind takes place, and the whole tends to become of the same temperature. If two unequally heated solid bodies be placed in contact, a continual approximation of both to an intermediate temperature takes place. In the case of the two gases, a separation may be effected by chemical means; but in the other two cases the former state of things cannot be restored by any natural process. In the case of the conduction or diffusion of heat the process is not only irreversible, but it involves the irreversible diminution of that part of the whole stock of thermal energy which is capable of being converted into mechanical work. This is Thomson's theory of the irreversible dissipation of energy."

SODA ALUM.—J. Berger Spence read a paper before Section B. a note upon which, in *Nature's* report, we copy:—"Mr. Spence said that hitherto many scientific chemists had doubted the possibility of producing soda alum; but the results of upwards of fifty experiments which he has made conclusively showed that this salt can be produced under certain circumstances. The principal point of interest in Mr. Spence's paper consisted in the discovery, made by him, that the crystals are produced from an amorphous mass, which is formed when the solution is prepared at high densities. The immediate result of this discovery may be that the large quantity of ammonia which is now used in the production of alum will be displaced in favour of soda, and that the valuable fertiliser, ammonia, which has no intrinsic value in alum, will be given to the soil, which, in an economic point of view, will be of considerable advantage to the country."

TOPOGRAPHICAL FEATURES OF THE TWO HEMISPHERES.—At the recent meeting of the American Association, J. W. Foster, LL. D. read a paper upon "Recent Advances in Geology," from which we make the following extract:—"In the Austral region we meet with projecting headlands and peninsula-like terminations of continents, and groups and chains of islands in the Pacific and Indian oceans extending over vast areas, which rise up like the peaks and crests of mountains. These are the evidence of a gradually engulfed hemisphere. In the Boreal region we have wide expanses of land diversified by mountains, prairies, and plains; elevated sea-beaches and river-terraces, most conspicuously displayed on the borders of the Arctic Sea; vast oceanic shoals; a marine fauna of a northern type preserved in beds of 1,400 feet, and stratified beds of gravel and sand 2,000 feet, above the ocean-level; clusters of lakes yet retaining their bitter waters; shallow seas once salt, but each decade becoming more brackish; vast desert tracts which up to a recent time formed the ocean bed;—all these phenomena indicate a hemisphere gradually emerging from the waters. Perhaps the physicist can discern in these great periodic oscillations, the method by which Nature perpetually renews the youth of our planet, and maintains its fertility."

PERMANENT STANDARDS OF MEASURE.—"The earth has been measured as a basis for a permanent standard of length, and every property of metals has been investigated to guard against any alteration of the material standards when made. To weigh or measure anything with modern accuracy, requires a course of experiment and calculation in which almost every branch of physics and mathematics is brought into requisition. Yet, after all, the dimensions of our earth and its time of rotation, though, relatively to our present means of comparison, very permanent, are not so by any physical necessity. The earth might contract by cooling, or it might be enlarged by a layer of meteorites falling on it, or its rate of revolution might slowly slacken, and yet it would continue to be as much a planet as before. But a molecule, say of hydrogen, if either its mass or its time of vibration were to be altered in the least, would no longer be a molecule of hydrogen. If, then, we wish to obtain standards of length, time, and mass which shall be absolutely permanent, we must seek them not in the dimensions, or the motion, or the mass of our planet, but in the wavelength, the period of vibration, and the absolute mass of these imperishable and unalterable and perfectly similar molecules."—*Prof. Maxwell.*

A NEW BATTERY.—"Another important addition made to chemistry since our last meeting is a new, very powerful, and very simple form of galvanic battery discovered, though not yet described, by Bunsen. In this second Bunsen's battery only one liquid, a mixture of sulphuric and chromic acids, and therefore no porous cells, are employed. The plates of zinc and carbon can all be lowered at once into the liquid and raised again at will. The electromotive force of this battery is to that of Grove—the most powerful of known forms—as 25 to 18; it evolves no fumes in working, and can be used for a very considerable length of time without serious diminution of the strength of the current, so that Bunsen writes me that no one who has once used the new battery will ever think of again employing the old forms."—*Prof. Roscoe, F. R. S.*

PHOSPHATES FOR SEWAGE.—David Forbes, F. R. S., read a paper at the late meeting of the British Association, in which, after briefly alluding to the numerous plans which had been tried for the purification of sewage, all of which had been practical failures, he called attention to what he said was an entirely novel process, brought forward by Dr. Price and himself. It was founded on the fact that certain mineral phosphates, especially those containing alumina, eagerly combine with the organic matter of sewage. A solution of the phosphates and milk of lime was added to the sewage, and the ammonia was precipitated in the shape of a double phosphate. Mr. Forbes illustrated the process with a bottle of Liverpool sewage, and the result was that in a few minutes the precipitate was seen falling to the bottom, leaving the water perfectly clear and free from smell. In fact, he contended that the sewage water so purified could be drunk without offence, and he caused some amusement by drinking a wineglass of the water."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

THE TARSHEISH.—*Chronicle*, Oct. 15th: We learn that this mine looks well in the lower tunnel. It is intimated that the buildings at the upper tunnel are to be removed to the lower.

LEVIATHAN.—*Miner*, 15th: Twelve tons of the 300 contracted for from this mine by the Birdsall's mill started to-day. It will be used in making bluestone, for the mill.

GLOBE.—S. F. Ahmher, M. E., has been during the week in preparation for the erection of Reduction works for the company. After a careful examination of the property Mr. A. says that the prospects more than meet his expectations.

AMADOR COUNTY.

The *Ledger* of the 22d says: Work at the mines is vigorously prosecuted, and preparations for the winter are being made everywhere.

BUTTE COUNTY.

FORESTOWN.—Cor. of Oroville *Record*, 22d: "Gaskell & Bowers' claim is drained by a flume over a mile long, and the cost of opening has been \$24,000. Two-thirds of that amount was taken out of a piece 150 feet square. They have 2,887 feet of ground on the lead ahead of their pipe; they have 800 feet of 12-inch iron pipe, and a pressure of 125 feet.

The editor has been shown by Mr. Gaskell three nuggets, which were part of the first clean up. One weighed 19 ounces, one 9, and one 3 ounces.

EL DORADO COUNTY.

MUD SPRINGS.—Cor. of Placerville *Democrat*, 22d: The Pocahontas at Logtown, cleaned up one hundred and one pounds of amalgam from a run of eleven days, equal to fifty pounds gold. Mr. March, of the N. Y. & El Dorado, has struck a splendid lead six feet in width, and improving. Our Supt. of the Eureka Canal, Mr. Morrelle, is enlarging and improving. He has nearly two hundred laborers on the ditch.

INYO COUNTY.

THE NEW FURNACE.—*Independent*, 17th: The furnace of Mr. Beaudry, at Cerro Gordo, is working in the most satisfactory manner. The cupola started September 29th, and on October 6th had 781 bars averaging 87½ pounds each, making 111 per day. October 9th, 433 bars, making 144 1-3 per day.

STRIKE.—The tunnel that Hannah & Co. have been driving for the Osceola, after passing through one promising ledge, struck the main one 1,000 feet from the surface, from which prospects most flattering have been obtained.

PLACER MINING.—We have been shown a nugget of gold, free from quartz, weighing 2 oz., 9 dwt., taken out at Big Pine creek. Gold from these diggings assays \$18.25 per ounce.

BULLION.—The amount of fine bullion shipped from the Kearsarge mine last week, per Express, was 8,730 ounces. For the week previous, 2,235 ounces.

BELSHAW.—Furnace will be stopped for a day or two to make some improvements.

RICH.—We have been shown, by Don Fermin of Deer Spring Valley, a piece of rich ore from the San Francisco Lode; also, a button of silver weighing 18 oz., which he extracted from 3 lbs. of rock.

EOLIPHE Co.—The machinery of the steam-stamp mill is on the ground. An immense boiler has been constructed at the mill, from sections brought from England.

From the Swausea and Belshaw furnaces, the shipments of bullion to Los Angeles for the ten months ending Sept. 27th, amounted to 1,419,387 pounds.

KERN COUNTY.

STRUCK IT.—Los Angeles *News*, 22d: A rich vein of gold-bearing quartz has been struck in the Jo. Walker mine, at Walker's Basin, and the water that heretofore obstructed the working is avoided by the new shaft.

MARIPOSA COUNTY.

PRINCETON MINE.—*Gazette*, 21st: The Mariposa Co. has now eight or ten men at the Princeton, taking out rock for a thorough prospecting with a view to recommencing operations. Several tons were crushed at the Mariposa mill last week.

SEBASTOPOL.—The John Snow mine is increasing in value. We are informed by one of the owners, that the result of last week's work was about \$1,200. The yield since July has been \$6,000. A one-half

interest was recently purchased by Mr. D. Hart for \$2,000.

We learn that the machinery for a part of the new mill being erected by the Mariposa Co. at Benton Mills, was put in position on Monday. Twenty stamps will be used now, and more when necessary.

ARASTRAS.—Supt. Fleming is about constructing arastras for re-working the sand, a large amount of which has accumulated.

NEVADA COUNTY.

A DIFFERENCE.—*Gazette*, Oct. 20th: Ten years ago each of the principal ditches in the county could supply water enough to keep 30 or 40 hydraulic claims in operation; now the largest could not furnish enough for one-fifth as many. Improvements in hydraulic mining have effected this result.

PREPARATIONS FOR MINING.—Same of 21st: R. B. Gentry & Co. have been running a tunnel for several years from the old American Hill outlet into Woods ravine to reach the ground formerly known as the Rogers' claims. The tunnel is now in nearly a 1000 feet, and will be completed in time to commence hydraulic mining as soon as water can be had. When completed it will be 40 feet lower than any ground that has been worked in the vicinity; and will open up for mining some 30 acres of gravel that has not been worked for lack of drainage. The owners intend using 1,000 feet of 15 inch pipe, and will have a pressure of 180 to 200 feet. The ground is known to be valuable. By means of this tunnel the Messrs. Craig will also be able to work a large amount of ground.

ORLEANS CONSOLIDATED.—Same of 24th: This Co. struck it rich on Saturday. In the bottom of the shaft, at depth of 75 feet, they have the vein a foot in width, exceedingly rich. The gold can be seen through all the rock.

CEMENT HILL G. M. Co.—The Cement Hill Gravel Co. are making arrangements for extensive operations. The lumber, pipe, and all material will be on the ground in ten days. Their flume will be 750 feet long, four feet wide and two deep. They have purchased 1,000 feet of 15 inch and 11 inch iron pipe, and expect to use 500 inches of water. Their perpendicular pressure will be 180 feet.

GRAVEL PROSPECTING.—*Transcript*, 21st: The Grass Valley Co., prospecting on the ridge above the Pennsylvania, have found large pieces of petrified wood, and have indications for an extensive gravel deposit.

Same of 22d says, the new steam hoisting and pumping works on the Orleans started up for regular work yesterday.

The Kansas is taking out first rate gravel.

The Cement Hill Co. own the canyon for a mile from the claims to the Yuba, and have sufficient fall to work to the very best advantage to the gravel bank.

HOPE GRAVEL MINE.—*Grass Valley Union*, 20th: For the week ending last Saturday the Hope took out 104 ounces of gold dust. This is worth \$17 per ounce. The prospects underground are as good as ever.

TORNADO MINE.—A crushing has recently been made, and the rock gave \$11.37 per load. The shaft is down 54 feet. Work has been suspended temporarily, in order to square up accounts.

EUREKA MINE.—Same of 25th: The report for the year ending Sept. 30th is published. Mr. Wm. Watt, Supt., says: "We have driven 747 feet of drifts, and sunk 89 feet of winze and 86 feet of main shaft. We have hoisted 19,962 tons of quartz, and crushed 20,562 tons in 306½ days, averaging a little over 67 tons per day with 30 stamps. We have concentrated 203 tons of sulphurets, and worked 267 tons, leaving six tons on hand, which I value at \$1,000. There are 1,198 tons of quartz on the surface, and 1,200 broke in the mine ready for hoisting."

The Assets of the company are valued in cash at \$194,497.70. There are no liabilities. The mine has been in operation, under its present management, since October 1st, 1865. In the five years the bullion taken out amounted to \$2,805,282.77. The ore (including sulphurets) paid for the year \$31.75 per ton against \$27.80 per ton for the year before. The company have paid 53 consecutive dividends in 51 months. The cost of mining has been \$8.32 per ton. The cost of milling, \$1.84 per ton. The cost of milling and concentrating the sulphurets has not exceeded \$2 per ton.

PLACER COUNTY.

BUCKEYE.—*Stars and Stripes*, 20th: On Tuesday Hon. D. W. Spear permitted us to examine some quartz from the Buckeye claim, Ophir District, owned by Judge Spear and W. B. Lyon. This rock now being taken from a depth of eighty feet, shows free gold and rich sulphurets. The Buckeye has been prospected with

caution. Of the quartz taken out this season, they have made four workings. The first, of twenty-two and a half tons, yielded \$810, or \$36 per ton. The second, of twenty tons yielded \$540, or \$26 per ton. The third, of twenty-three tons, yielded \$555, or \$24 per ton. The last from the greatest depth, consisted of twelve tons, which yielded thirty-five dollars in free gold, and seven hundred pounds of clean sulphurets, that assay \$436, which will fetch this lot up to \$45 per ton.

THE GRAVES-PUTNAM MINE.—*Herald*, 22d: Mr. Graves informs us that they have boxed some six tons of rich specimens and have enough in sight to make fully fourteen tons of gold-quartz nuggets. From the samples, we should say that this rock would yield from \$3,000 to \$10,000 to the ton, and that a man might make \$200 or \$300 per day by reducing in a hand mortar. The company have out some 300 tons of rich milling rock, all of which has been raised within five weeks. This claim is on the Marcellus ledge, at Baltimore ravine. The ledge runs from six to twenty inches thick so far as opened. Mr. Putnam is now below to purchase a mill, which will be at work if possible, by the 10th of December. This will do for an exhausted mining district.

THE MINES.—We looked at a few on Tuesday. At the mine of Green & Co., we found the boys taking out ore some of which was one-fifth gold. There are four hundred tons on the dump from which specimens can be picked up at almost any place showing free gold. There has been systematic work done on this mine for the past two years, all of which has been paid for from time to time by reducing small lots of ore in a small arastra or in a hand mortar. The pumping and hoisting works are propelled by water power at a cost of about \$60 per month. The main shaft is down 120 feet, and another 80 feet, a tunnel connecting the two. There has been no quartz milled, nor will there be until they erect their own mill. This mine is not for sale.

At the Buckeye, the old shaft is down 140 feet, and the new one 70, showing free gold and rich galena and sulphurets. The ledge at this point is 14 inches thick, and the last crushing of 12 tons, yielded \$30 per ton in free gold. At the St. Patrick, Mr. Henry, Supt., has 13 men at work. The main shaft is down 145 feet and levels have been run at various depths, all of which have shown good, and in some instances astonishingly rich rock. The ledge is two feet thick. There is now upon the dump forty or fifty tons of good milling ore. The Shipley ledge is two feet thick. The mill is on Doty's ravine and the ledge can be cut with a tunnel of 200 feet at a depth of 100, and the quartz run directly into the batteries. The mill is 10-stamp and will be run by an overshot wheel of forty feet diameter. It will be completed next month. The shaft on the Battis mine is down 50 ft. They have out 15 tons that will yield \$30 to \$40 per ton by mill process.

SAN DIEGO COUNTY.

The Nevada *Transcript* of Oct. 20th says: Peter Gravius, formerly of Moore's Fiat, an experienced miner, has just returned from San Diego. He has visited all the mines in that locality, having been there since the first excitement, and he says of the three hundred men now about the mines two hundred and fifty would leave if they had money enough to get away. The Coloma district is a placer mining country of limited extent and little value. The Julian has several rich quartz ledges, but the gold is hard to save, and the whole country is claimed under a Spanish grant. There are two quartz mills, one of ten and one of two stamps in the district. The miners are paid \$2.50 per day, and get employment about a third of the time.

TRINITY COUNTY.

THE DEEP SHAFT.—*Journal*, 22d: This is now down one hundred and twenty odd feet, and the workmen have struck a layer of seamy clay bedrock that will not stand. In sinking two feet and a half, all of one side slid in, and the shaft will have to be timbered. No gold is found in this formation.

Nevada.

COPE DISTRICT.

INDEPENDENCE VALLEY.—*Elko Independent*, Oct. 22d: At Tuscarora, the Chinese are packing dirt to water, some making considerable money. One Co. has taken out \$5,000 from dirt packed on their bamboo sticks. These claims pay from \$5 to \$10 and \$20 per day, during the rainy season. Mr. Drumm says one nugget of 25 ounces was found last Spring—another of

15 ounces, and several pieces of four or five ounces.

HUMBOLDT.

RAILROAD DISTRICT.—*Elko Independent*, 19th: The Palisade Smelting Co.'s furnace has been in constant operation for a week, turning out large quantities of bullion, which has been shipped to San Francisco, via Carlin.

REESE RIVER.

BULLION.—*Reveille*, Oct. 18th: Since Sunday, 16th, the Manhattan Co. has shipped to New York through Wells, Fargo & Co., 14 bars of bullion, weighing 1,291 pounds, and valued at \$20,273.

SILVER BEND.—Same of 19th: We were informed to-day that Caulfield's new 10-stamp mill at Belmont was progressing rapidly. It will be supplied with the Stetefeldt furnace and will amalgamate in barrels, and will be second to no silver mill in the State.

MONTEZUMA.—Same of 20th: We learn from J. M. Dawley, who returned yesterday, that the 10-stamp mill of McGlew & Dawley would be running within thirty days. Ore is accumulating rapidly.

WASHOE.

YELLOW JACKET.—Oct. 22d: Daily yield, 175 tons, all from the three lowest working levels. The drift north at the 1,000-foot level has 30 feet further to go to make connection with the winze from above. Some good ore was found in the face of this drift night before last, and the indications are that the drift is about cutting into the ore body already developed.

SAVAGE.—Daily yield 70 tons. The good body in the old upper mine, near the Gould and Curry line, holds out well, showing an improvement in the character of the ore. Nearly 20 tons per day comes from this, and the balance, of lower grade, from the lowest working level, which also shows improvement.

CROWN POINT.—Upper levels yielding 40 or 50 tons of fair ore per day. The incline is down 90 feet below the 1,100-foot level, the bottom being in barren quartz.

IMPERIAL EMPIRE.—The 1,300 foot station is opened, and drifting east is progressing. The shaft is 1,325 feet deep. An assessment of \$4 per share was last Tuesday levied, delinquent November 22d.

GOULD & CURRY.—Daily yield 120 tons; average assays from car samples, about \$50. The Potosi section is not yielding quite as well. The first class ore is pretty much exhausted.

VIRGINIA CONSOLIDATED.—Main drift west from the new shaft, at the 500-foot level, in 680 feet. No water to trouble, and rock favorable.

BELCHER.—The raise above the 200-foot level still shows improvement. The ore seam is five feet wide. At the south end of the 420-foot level, quartz of favorable quality is found, which improves.

HALE AND NORCROSS.—Daily yield 175 tons, principally from the seventh level. The ore hereabouts south of the shaft at that level show improvement. The other producing points look finely.

SACRAMENTO AND MEREDITH.—The mill is yielding satisfactory bullion returns. This mine contains a vast amount of good paying ore, easily got at.

CALEDONIA.—Daily yield 80 tons from the 200 and 300-foot levels, keeping the Pitute and Sapphire mills running.

SILVER NEVADA.—The last shipment of bullion, made on the 15th, from a twelve days run, yielded nearly 10,000. The ore deposits are looking as good as ever.

CHOLLAR-POTOSI.—Daily yield 280 tons. No change to note in the ore sections. They are all looking well, especially the Belvidere.

OPHIR.—Nothing new in the upper mine. Drifting south at the lowest level has nearly reached the south line.

OVERMAN.—Yielding 70 tons daily. The south part of the 300-foot level looking well.

HOPE.—Daily yield 43 tons of \$26 ore, keeping both mills running.

OCCIDENTAL.—Mine and mill running as usual.

BUCKEYE.—*Enterprise*, 21st: Hill & Co. having succeeded in having the injunction of Booth & Co. set aside, are now working this mine, in Devil's Gate District, successfully. They are getting out a large amount of excellent ore, which is being crushed at the Atlanta mill, below Silver City.

WHITE PINE.

ITEMS.—*News*, 23d: The Eherhardt still employs a force of 15 men, who are not only developing the mine, but are taking out sufficient good ore to keep the Oasis mill, in Swausea, constantly employed. South Aurora shows by its bullion returns that it is one of the main etays. Ward Beecher is an extraordinary piece of property. The large vein of ore developed is

proving of greater extent and richness daily. Fifty tons and more are being daily extracted and hauled to the Sheba and Big Smoky Mills. The company is working all the men they can conveniently place. The mine has cleared \$20,000 over all expenses for the past month, and will clear \$40,000 next. O. H. Treasure has 30 men employed, and developments are being made. Some good ore coming out of Noon-day. But little work is being done on Chloride Flat. The mines of the Consolidated Co. are being let out on lease in small parcels. Some good rock is brought to light. On the Base Range, the Jennie A. Co., has started the Hamilton Furnaces—on ore from their own mine. A sufficient quantity is being taken out to keep the two constantly employed. A few men are at work on the Imperial taking out rich ore. Gov. Matteson's mines, on the other side of the Jennie A., are producing a large amount of good smelting ore. Around Mt. Ophir and Monte Christo the mines are being actively worked.

MILLS & SMELTING WORKS.—All the mills in the District, with the exception of the Chicago and a little five stamp mill in Sberuautown, are running. The Big Smoky is building a dry-kiln, and a new-fangled rotary roasting machine. The White Pine mill is running with good results. Gov. Matteson's furnaces are running with success. The machinery for the separating works is on the ground, and the mason work nearly completed. The Powers' Furnace is turning out fair bullion.

PIOCHE BULLION.—Elko Independent, Oct. 22: W. F. & Co. shipped from the Pioche office, for the week ending Oct. 16, bullion to the value of \$45,365.

ENREKA.—Sentinel, 15th: At Spring Valley, the Curtis & Co. is becoming one of the noted mines. Some specimens are very rich. The Ida is improving. Ditto the Independence. The Reeves & Berry is idle, because the owners cannot agree upon the plan for working it.

Idaho.

ITEMS.—Analanche, 15th: The Belle Peck mine has a vein six inches to a foot in width, fabulously rich in both silver and gold. It is decomposed quartz, requiring no blasting. Mr. Peck now has five tons on dump. A rich chimney has been found below the discovery shaft. The first class ore will yield 50 cents to \$2 to the pan. Sands, Cheshiro & Co. are prosecuting work on the Illinois Central. A drift is in 30 feet on the 30-foot level, where the ledge is increasing in width. They have 50 tons ready for crushing. Gilmore & Dolberg are taking ore from the Silver Wave, in almost any of which free gold can be seen with the naked eye. There are three or four veins, the largest of which is six inches in width. The Chipmunk ledge is only four inches wide, but rich. Jones & McMahon are taking fine looking ore from the Red Mountain. The new shaft is 31 feet deep. Skokum ledge is 10 inches wide; no blasting required. Will soon work 100 tons 2d class ore at the Minear mill. The first class will be worked at the C's arrastra. Pete Nick has found a 2½ ft ledge in the Mahogany mine. Oro Fino engine is being repaired, and everything will be in working order in a few days.

LOON CREEK.—Boise City News, 15th: Jo Smith returned this week, and avers that the "bottom has fallen out of that country." He says work on all the mines has been suspended, and houses are selling in Oro Grande at two hits apiece.

Montana.

ITEMS.—Helena Gazette, 17th: All the mines of the Whitlatch Union lode are worked, and all the mills running. On Big Indian gulch the Gold Hill vein is worked by the Parkinson Bros. & Co., and the old mill on Clark's Creek is crushing the rock. Highland and Moose Creek were never looking better, and in the vicinity of Virginia City and the old Hot Springs District, more activity than ever is manifested. Green Campbell lode is doing finely. The mill has been running steadily. Half a dozen parties at the same place are working by arrastras, and doing well.

DIAMOND CITY.—Cor. of same: The Co. at Trout Creek, whose mine is so thoroughly drained by the great 22-inch pump were on Monday breasting out in gravel prospecting 50 cents to the pan, with every indication of increased pay. It is believed they have a fortune. The gulch mining in New York, Oregon, Cave, Cooper, and other gulches in the neighborhood of the Missouri river, is carried on with such energy as the supply of water will justify.

MISSOULA.—Pioneer, 13th: A quartz-lead has been discovered four miles above this locality. A cut fifty feet long has been run across it, and no wall-rock struck. Jim Sweeney & Co. have bought all the ground at the mouth of the creek. They cleaned up \$20 a day to the hand last week, on the river beach. Texas Bar will be

laid over until spring. The McKay Company are bringing water on their claims.

CEDAR CREEK.—New North West, 14th: M. Farrell & Co. struck a good pay streak at a depth of 22 feet. Pay gravel is 18 inches deep. This is on No. 99 below, in Barrett's District.

The upper portion of the gulch about Forrest City is developing well, some eight or ten claims paying. In the Lower gulch—about Kiyuse Bar—a number of Companies have reached bedrock. Among these the Co. on 80 struck it at 26 feet, on 87 at 16 feet, on 95 at 20 feet, and on 98 at 22 feet. This latter is the Simmons. On Monday they began running across for the channel. No. 98 are on the channel, have two feet of gravel prospecting from 5 to 25 cents to the pan, and two feet of soft bed rock that prospects well.

ITEMS.—Deer Lodge Independent, 15th: On Quartz Gulch, Charley Adlesberger, one day last week, with four hours' water, took out \$180, with two men. McClellan Gulch is pretty much worked out. Sharp, Price & Co., at the month, are making \$10 per day to the hand, and have a large lot of good ground yet. Blakeman & Co. recently discovered a new channel below the mouth of Crevice gulch, that is rich. On Carpenter's Bar, Green & Co. and Duffey and Co., are doing well. As high as \$10,000 has been taken out of these claims at one clean up, during the season. Ponds & Co., are putting up a telegraph 1,000 feet in length. Bullard & Mellen, on French gulch, near Pioneer City, strip and shovel into sluices from \$3,000 to \$7,000 per week. Their claim has averaged \$4,000 a week the entire season. Last week they found a nugget worth \$217.71.

VIRGINIA CITY.—Cor. of same: In Summit district there are two mills running—the Union, on ore from the Oro Cache lode, and the Excelsior, or How mill crushing from Caveron & Layton's Midas. One hundred ozs. of bullion were obtained from 50 tons of Oro Cache. Postlewait, is about starting up on ore from the Keystone. In Brown's gulch there are three mills running on silver ores. Cannon's—steam—and the Gormley and Bennet & Sterrei mills, run by water.

Arizona.

The Prescott Miner of Oct. 8th, learns that there is considerable stir in the mountains on the California side of the river, in silver mining. Veins have been opened containing silver chlorides that pay thousands of dollars per ton. A landing near Cottonwood Island has been purchased by a company, and preparations are making to commence shipment of ores to San Francisco.

WALNUT GROVE.—Same of 15th: Fred. Henry's Rainbow lode is yielding very rich ore. He will soon commence crushing it in Cul-lumher's arrastra.

Lower California.

SAN RAFAEL PLACERS.—San Diego telegram, 20th: Reports from the San Rafael Valley Mines are favorable. It is estimated that about thirty men arrive daily. Over a thousand miners are at work, and without pack animals make from one to five dollars each per day. The pay dirt is very rich and seems to be inexhaustible. Parties who have prospected the country, report the mines to be fully as rich as those of El Dorado County in early days.

CONTRA.—Peter Gravius, just returned to Nevada City, Cal., informs the Transcript that the San Rafael mines are of very limited extent. There is no water in the district, and the gravel has to be carried from two to five miles before it can be washed. Mr. Gravius thinks 100 men with water to wash, as our gravel mines are worked, could wash out the entire district in sixty days. He thinks himself in the biggest kind of luck to get back home.

New Mexico.

The Virginia Enterprise of 13th, gives extracts from a letter dated Aug. 10th., written by Dick Preston. We quote: "The Burro excitement has about fallen through. There are three good locations there. They show an abundance of very rich ore, so far as prospected. There are about two hundred half starved wretches hanging around Raibson, who would emigrate if they could get away. The country from Tucson to Burro is held by the Apaches."

Oregon.

BAKER CITY.—Cor. of Dalles Mountaineer, Oct. 15: quartz mining has received a new impetus in the discovery of splendid leads in Auburn. One lode owned by E. M. White & Co. has proved by arrastra so rich in gold, that the company have gone below to procure a mill. The old Ruckle Lode affords employment for a large number of hands, and shows no signs of petering. The Burnt river ditch company have sold out a large proportion of their ditch to the Chicago Co., and hundreds of men are employed in its enlargement.

The Plaindealer learns that Browning & Co. at Galesville, crushed two tons of rock the first day, which yielded one hundred dollars. The mine is on Cow creek near Leland.

Utah.

The Salt Lake Tribune of Oct. 15th says that average assays of ores from Willard District show \$200, to the ton in silver.

The Messrs. Woodhull have run out 20 tons bullion since starting their smelting works. They have 200 tons of ore on hand and are buying from all quarters. They will erect two additional furnaces.

The Herald of 21st, says that works for smelting ores are to be erected immediately at the mouth of Cottonwood canon in this valley, and of East canon Rush valley.

SAN FRANCISCO, THURSDAY EVE., OCT. 27.

Mining Stocks.

The stock market at the end of last week was quite active and firm in standard descriptions although otherwise rather irregular. On the 21st large sales were made of Chollar-Potosi, Savage and Yellow Jacket, nearly 2,000 shares of the latter changing hands, and the price reaching \$35, the highest point attained in two months. This fell the next day one dollar, recovered on Monday, advanced on Tuesday, then dropped three dollars on Wednesday and still more on Thursday.

At the beginning of the week, the market showed a good demand for mining stocks, particularly for Chollar-Potosi and Golden Chariot. Chollar reached on Monday a point before untouched in four years, \$72, managing then to get up as high even as \$75, which is the highest figure it has reached for four years. This stock has had considerable mutation this year, ranging from \$18 to \$21 in January and February, from \$22 to \$32 in March, from \$27 to \$29, in May, and from \$24 to \$30 in June. It then rose quite steadily in the next two months to \$37 and to \$47, then fluctuated wildly in September between \$46 and \$61, and now it has risen, within the last twenty days, \$26 or \$260 per foot, thus materially interfering with the plans of those who have been selling for future delivery in the expectation of a decline. It did not remain long at its highest point, however, falling \$10 the next day, and then raising \$3.

The general tone of the market was an upward tendency at first, then a reaction on Wednesday, being weak and irregular on Thursday. Golden Chariot rose steadily from Friday until Monday, then dropped suddenly \$4, but rose again still higher. Yellow Jacket rose from \$33 to \$38, then fell to \$35½.

The last weekly report of Gould and Curry showed 600 tons of ore taken out, averaging \$43.19 per ton. From Crown Point, 555 tons were extracted last week. But the details of the kind for the several mines will be found, as usual, in our mining summary.

The third annual meeting of the Enreka (Grass Valley) G. M. Co., was held on the 19th inst., when the following trustees were elected: L. S. Adams (President), W. Watt (Superintendent), M. Bulkeley, A. J. Pope and N. Booth, Treasurer, F. Benton; Secretary, S. Urgener. The Secretary's report shows thus:

RECEIPTS.

Proceeds from ores worked.....	\$617,374
Sulphurets.....	44,435
Assay chips.....	84
Working 430 tons sulphurets.....	6,564
Premium, etc.....	3,496

Total receipts for year.....	\$671,953
Cash on hand October 1, 1869.....	54,871

Total.....	\$726,824
------------	-----------

DISBURSEMENTS.

Dividends to stockholders.....	\$400,000
Mining supplies and labor.....	171,405
Milling supplies and labor.....	38,344
Sulphuret reduction works.....	7,922
Construction account.....	9,469
Assaying and freight on bullion.....	2,506
Wood supplies not included above.....	3,510
General expenses, etc.....	9,302

Total disbursements for the year.....	\$642,465
Cash on hand October 1, 1869.....	84,359

Balance as above.....	\$726,824
-----------------------	-----------

Thus the mine has paid not only current expenses, but also dividends to the amount of \$100,000, and moreover, the cash balance has been increased by \$30,000.

The assets of the company amount to \$194,498. There are no liabilities. The assets are calculated as follows:

Cash balance as per report.....	\$84,359
Sulphurets and ores available.....	20,951
Wood, 2,642 cords.....	10,230
Supplies at mine and mill.....	5,959
Mill (estimated value).....	40,000
Mine improvements and buildings.....	30,000
Sulphuret works.....	3,000

Total assets.....	\$194,498
-------------------	-----------

The amount of ore mined during the year was 19,762 tons, and the amount reduced at the company's mill was 20,532 tons. Average yield of ore, \$31.75 per ton. There were also 430 tons of sulphurets worked, yielding an average of \$166.45 per ton. The average cost

of mining was \$8.32 and of milling was \$1.84 per ton. The net profits for the year were as follows:

Paid to stockholders.....	\$400,000
Paid for construction.....	9,103
Paid for additional supplies.....	5,360
Excess of cash on hand.....	20,487

Total net profits.....	\$434,950
------------------------	-----------

Annexed to the Secretary's report is a statement of the Company's financial operations from October 1, 1865, the date of commencing business, until September 30, 1870, during which period the receipts from bullion and other sources were \$2,822,567, and the disbursements, \$2,751,020. The latter amount was for the following purposes:

Purchase of mining claims.....	\$ 285,651
Construction.....	110,892

Total.....	\$2,822,567
------------	-------------

Such a record as that of this mine is to be shown by few, if any of our mines. The net profits for the three years amounts to \$1,832,089, of which \$1,334,001 (over 72 per cent) were returned to stockholders. In 51 months 53 consecutive dividends have been paid. From Oct. 1867, to Sept. 1870 dividends have been paid every month, except in February, 1869, when \$40,000 were paid for an adjoining claim. There were paid in dividends, \$290,000 from Oct. 1867 to Sept. 1868; \$264,000 in 1868-69; and \$400,000 in 1869-70. The ore (including sulphurets) has averaged \$31.75 per ton, against \$27.80 in the previous year. Superintendent Watt reports that he has driven 747 feet of drifts and sunk 89 feet of winze and 86 feet of main shaft during the year. The mill has 30 stamps, and has been idle only 4½ days, and then for the want of water. There is 2,400 tons of quartz on the surface or broke in the mine, ready for hoisting. He estimates 27,000 tons of quartz yet on the fifth level, and above, which, with the sixth level not yet drawn from will furnish work for the mill, at the present rate, for three years, without further sinking. The proposition to increase the capital stock and number of shares was indefinitely postponed. The present number of shares is 4,000, of the par value of \$300 each. There has been no recent sales of the stock, though on the 17th of September a lot of five shares sold at \$325 per share.

THE SCIENTIFIC PRESS.—To the miner and farmer who consider the Press the most valuable publication on the Pacific Coast. Every number contains matter of interest to the farmer and general reader; and to the miner the Press is a sine qua non.—Inyo Independent

Holloway's Self-Adjusting Gang Plows.

The gang plow which we herewith illustrate is a California invention, and is shown in the form in which it was first manufactured in San Leandro, in 1866 and '67. In 1868 and '69 they were made at San Quentin where they were sold for \$90 each.

The cheapness and simplicity of this plow has given it a great degree of prominence and success in California, and the fact that it is so well known among the early invented gang-plows, renders its illustration in our columns at this time of interest to many. The inventor advertises a standing offer of \$100 to any plow that will do better work with the same draught-power in any soil.

The plow frame has a double hinge connection with the axle, which is not shown in the engraving, but which is one of the best features of the mechanical device, as it allows the plows to run at any depth, and, also to be pointed high or low at will, by the set of the adjustable rods, which connect with the top lever. The plow can be raised and lowered independent of the seat and driver's weight.

Mr. Holloway has added another improvement, also not shown in this cut, which consists of a crank on the land side, so attached to the axle, that the plow will adjust itself to any inequality of land surface. Many gang plows are so confined in lever ratchets as to run stiff, and are subject to be thrown out or in with the motion of the wheel, over the rough ground; but this plow instead of being confined by the lever, runs perfectly flexible—adjusting itself to any surface without attention. The depth is governed by the adjustable rods which give pitch to the point of the plows.

Mr. H. is not only a practical mechanic, but he has also a practical experience in plowing, and possesses intelligent ideas of what constitutes good plowing, and which are indispensable to a thorough and practical application of correct principles.

We think that he has devised a plow well worthy of attention, and as such, we feel justified in thus speaking a good word for it. Mr. Holloway is now manufacturing his plow at his shop in Gilroy where he can be found.

Wine Making in Washoe.

Mr. Andrew Milatovich, of Virginia City according to the Territorial *Enterprise*, is making several hundred gallons of wine, by a process quite different from that generally employed. He uses grapes of California growth, mixing different varieties according to the kind of wine he wishes to produce. No pressure is used in extracting the juice; but the grapes are simply mashed up by hand. The juice and mash is then placed in large casks. After standing in the casks a certain number of days the wine is drawn off and put in barrels, where it remains till it is ready to bottle. He puts no water or sugar in his wine—it is the pure juice of the grape. After the wine is drawn off from the casks, they are filled with water, and the mash being worked over, excellent vinegar is made. Mr. M. is making port, claret and one or two other wines, using different varieties and mixtures of grapes. He claims that the wines he thus makes are far superior to those made in California. The process is certainly a very simple one; and if good wine can be thus produced, its manufacture is simpler than the manufacture of common cider, as not even a press is required.

WINE MAKING IN NEVADA.—The Nevada *Gazette* says that M. J. J. Ott, one of the leading grape growers of Nevada county, is making wine not only from grapes of his own growing; but he is also purchasing largely of his neighbors. He pays from \$40 to \$45 per ton, for grapes, and finds them scarce at that; from which we infer that the growers about Nevada city are finding a good market for their grapes this year. If Mr. Ott can afford to pay \$40 per ton for grapes, their cultivation in the foot hills ought to be about as profitable a business as any in which a man can engage. This price is about double that which is generally paid in the Sacramento and Coast

Feeding Moss to Stock.

Most of our readers are familiar with the fact that the reindeer lives almost entirely upon the moss which grows upon the rocks and barren hill sides of Arctic regions; but it is not so generally known that the moss which grows so luxuriantly upon the oaks, along the coast range and in many other parts of California and adjacent States, is readily eaten by cattle and sheep; which, in fact are very fond of it. During seasons of drought, and often indeed in the latter portion of our ordinary summers, when feed becomes scarce, herdsmen in some localities of this State are in the habit of gathering this moss and feeding it to their sheep.

The value of the mosses for food both to

makers. Some are far more nourishing, weight for weight, than the best of hay, and approach very nearly in food value to grain.

The mosses of the lower latitudes are generally less valuable for food than those produced in colder regions; being more fibrous and containing less sugar, starch, etc. We are not aware that any chemical examination has yet been made of those on the Pacific coast, whereby their food value can be estimated; yet we are informed as already intimated, that they are often used here, in times of scarcity of pasture, as food for stock. As moss in this State usually grows upon trees, herdsmen are obliged to pull or cut it off from its place of growth, in order to place it before the stock, a very slow process and one attend-

Cheese Manufacture.

Large amounts of cheese are being shipped from Lake County to this city. The Lower Lake *Bulletin* of that county claims that from one and a half to two cents per pound more is obtained for Lake county cheese than for that manufactured elsewhere in the State.

In this connection we may state, on authority of the *Pajaronian* that a cheese factory is about to be established at or near Watsonville, "to be conducted by experienced persons in the business." The milk will be furnished from different dairies in the vicinity, where small quantities of cheese are now made. By establishments of this kind a new impetus might be given in this State to this important branch of dairy business—a better, more reliable and more saleable quality of cheese might be placed in the market, such as would effectually put a stop to Eastern importations of this article. The manner of conducting such a business is given by the *Pajaronian* as follows:

The first thing to be established is to ascertain how much cheese a given amount of milk will make—the general estimate, we believe, by old cheese makers, and at the factories, being one pound of cheese to a gallon of milk. Then all those who have milk for sale, whether it is one gallon or 100 gallons per day, or even one gallon per week, are given credit for what-

ever amount they carry to the factory, and weekly, monthly or quarterly, are paid their proportion less a small percentage per pound for the making. With such an establishment in our midst, many persons who now keep one or two cows for their own use would find it a source of profit to keep as many as their pastures would accommodate,—all the trouble falling to their share being simply the milking; the factory doing the rest.

HOLLOWAY'S SELF-ADJUSTING GANG PLOW.

man and beast, is now becoming generally known. In Iceland they are largely employed for fattening cattle, sheep and swine; and the natives make soup and bread of them for their own use. As food for stock, one ton of Iceland moss, just as it is gathered from the rocks, is considered equal to half a ton of meal.

Moss, mixed with the roe of fishes is largely eaten by the natives of northern Asia, also by the Indians on the northern portion of this continent. The unfortunate Sir John Franklin, found it an important means of subsistence for himself and men on one of his earlier journeys to the Arctic regions.

Mosses grow upon almost every substance, when alternate moisture and dryness can be found. Destitute of roots, they depend almost exclusively upon the air for sustenance. Over 200 different kinds are known to subsist. Some varieties contain large amounts of acid principles, which render them less valuable for food than others which are composed mainly of sugar, starch, oil, resinous and waxy matters; all contain more or less phosphate of lime, and iron, which render them available as bone and manure

ed with much inconvenience, without suitable appliances for such work.

A correspondent has sent us a drawing of a convenient instrument for cutting and gathering moss which is in use among the herdsmen in Santa Cruz county, and probably in other portions of the State. A careful inspection of the engraving will readily make the mode and manner of its use apparent. The instrument, having a socket at its lower extremity, is fastened upon a long pole, so that the person operating it may stand upon the ground.

EUROPEAN ARMY SUPPLIES.—Nearly all the salt meat for the French War Fleet is supplied from American hands. It is considered the best and most wholesome of any of the class used which can be obtained.

A large portion of the flour is also from this country. It was from this flour, in a large measure, that the bread was made which was baked, in the early part of the war, for the Army of the Rhine.

Late correspondents from France report that much anxiety is felt with regard to the condition of the American bread market, as the opinion prevails that large quantities must be drawn from here during the next twelve or fourteen months, even if the war is speedily brought to a close. War makes great waste. A large portion of the present crops have been destroyed or wasted, and the unsettled condition of the country for the next few months, at the best, must prevent any very extended production of bread stuffs for the coming season.

OREGON SEED WHEAT FOR WASHINGTON.—The *Oregonian* says that Hon. A. J. Duff has 100 bushels of choice white and red spring wheat cleaned up at McLaren's mills, in this city, within a few days past, which has been forwarded to the Commissioner of Agriculture at Washington.

Household Reading.

The Staff of Life.

Bread has very properly been called the staff of life, for the average distribution of the elements of which it is composed more nearly correspond with the requirements of the human system than any other class of food; and life and health can be continued on wheat alone, when it is properly made into bread, for an indefinite period of time, provided water and good air are also present.

Composition of Wheat.

In order to understand, more fully what we propose to consider, it will be necessary first to know what wheat substantially is, and the relative proportions of its different elements. Its average composition may be given as follows:

Water.....14.0	or	(Water.....14.0
Gluten.....13.0	or	(Nitrate or Mus-
Albumen.....1.8	or	(ele Makers.....15.6
Starch.....60.2	or	(Carbonates or
Sugar.....6.5	or	(heat and fat pro-
Fibre.....1.7	or	(ducers.....68.4
		(Phosphates or
		(food for bones,
		(brains, nerves,
		(etc.....2.0
Mineral Matter 2.0	or	

100.0

100.0

The above substances are in about the proportion required to keep up the natural waste of the human system, in moderate weather and with the ordinary

use of the mental and physical faculties. In very cold weather, such as is met with in high latitudes, an excess of carbonaceous or heat and fat producing material is required, and this is most readily obtained from fat meat. Let the most fastidious person reside for a short time in Labrador and he will be astonished at his appetite for fat pork and even seal blubber.

We give, in the accompanying illustration, sectional views of grains of wheat and corn, with the relative proportions of the elements which are employed for muscle making, heat and fat producing and brain and nerve food, distinctly shown. In Fig. 5, the letter *a* represents the peculiar shading employed in each of the several grains to represent the proportions of nitrates or muscle makers in that particular grain; the letter *c* represents the phosphates or brain and nerve food so contained, while the absence of shade or white as at *b* shows the proportion of carbonates or heat and fat producers. The small figures *a*, *b*, *c* and *d*, on the left merely represent the grain of wheat of natural size. While the three large sectional figures on the right, represent the location in the grain where the elements are chiefly found, it should be also understood that these several elements are not altogether confined to the particular shading assigned to them, but they are to a certain extent, each mixed with the other.

It is also important to observe and know that different varieties of wheat vary somewhat in their relative proportions of the different elements named. Some have more nitrogenous matter and are therefore better calculated to impart muscular power; while others have more phosphate and are hence more useful in giving mental and nervous energy.

It will be observed that in the wheat grain, the chief proportion of the muscle, bone and brain producing elements are found in the extreme outer layers, or that portion, which, by reason of its fibrous or glutinous nature, it is difficult to grind fine, and which must go chiefly to bran. The fat and heat producing elements are extremely brittle and easily ground sufficiently fine to pass through the bolting cloths or sieves employed to separate the flour from the bran. These outer layers contain nearly 16 per cent. of the entire grain, (in California wheat about 18 per cent., on account of its less moisture,) nearly all of which is rejected in the milling process, in order to obtain a white at the expense of a good flour.

The germ, which is represented by the shading *c* as containing the chief part of the phosphates, is largely made up in bulk of water and gluten, and hence appears quite out of proportion to the figures given

in the table of analysis, which is made to contain only 2 per cent., while in the diagram it will appear to be fully 10 per cent. and even more in our figures. This portion of the grain although not fibrous, contains nearly all the water, by reason of which and its glutinous character, it mostly goes with the bran, in the ordinary manufacture of flour.

Lessons to be Learned.

Nothing is more self-evident than that in this use of perfectly white flour, we sacrifice the most important portion of the grain, merely to please the eye—for to the taste, except where it has been especially educated otherwise, there is no objection.

We exercise more judgment and discretion in feeding our fowls and pigs, in order to secure a supply of eggs and pork, than we do in a proper building up of the bones, muscles and brains of our children and even ourselves.

We said at the beginning that a child or an adult could live and retain health for an almost indefinite period on wheat bread properly made; and we may now add at the close that if we were to feed our children exclusively on bread made from superfine flour, the most of them would probably die inside of two months.

Who can tell the suffering brought upon the innocents, in the way of defective teeth, soft and rickety bones, etc., by the lack of the very properties which we recklessly throw away or reserve for hens and pigs? Not more than one-half of our children grow up, and nearly all who die, are lost through the violation of nature's laws in the matter of food. A large proportion, even, of those who live are, for the same reason, improperly developed in bone and muscle, and thereby rendered susceptible to disease. By a lack of nitrogenous and phosphatic, and an over-abundance of carbonaceous food, the bones, nerves and muscles become weak, while the whole system is so heated as to be easily influenced by the first spark of disease—hence, while our brutes are generally healthy, poor human nature is subjected to the numberless ails of inflammations, fevers, neuralgic pains, consumption, etc. If no more care or judgment was exercised by cattle raisers in feeding their animals than is shown by fathers and mothers in feeding their children, beef would have to treble in price, or cattle raising would be a ruinous business.

How to Make a Good Door Mat.—With the approaching advent of the rainy season some of our readers may be glad to know how they can make a cheap yet serviceable door mat.

If you have or can get some good corn husks, take, first, an inch board the size you wish your mat; dress it neatly; rule it each way, drawing the lines $1\frac{1}{4}$ inch apart; bore a hole with a $\frac{1}{4}$ -inch auger in each square; double a piece of broom twine, pass it through the holes, one at a time; have the husks dampened, take a sufficient quantity to fill the hole very tight, pass it through the loop of twine, draw it through until the double end of the husk is $1\frac{1}{2}$ inches long, draw the twine out and proceed in the same way until the holes are filled. Then take a sharp knife and cut the double husks, spread them apart, trim the uneven side, tramp it down, and set it where it is to be used, either side up.

A SHEEP SKIN MAT.—If you want something nice in this line, take two sheep skins and proceed as follows:—Make strong soapsuds, using hot water, and let it stand till cold; then wash the skins in it, carefully squeezing out all of the dirt from among the wool; then wash in cold water till all the soap is out. Next dissolve half a pound each of salt and alum in a little hot water, and put into a tub of cold water sufficient to cover them, and let them soak twelve hours; then hang over a pole to drain. When well drained, stretch carefully on a board to dry. Stretch several times while drying. Before they get entirely dry, sprinkle on the flesh side one ounce each of finely pulverized alum and saltpeter, rubbing it well; then lay the flesh sides together and hang in the shade for two or three days, turning them over every day till perfectly dry. Finish by scraping the flesh side with a blunt knife to remove any remaining flesh, and then rub the flesh side with pumice or rotten stone and the hands. Very beautiful mittens can be made of lamb skins tanned as above.

DEVELOPEMENT THEORY.—An English writer asks, "Where and when, if man ever was an animal, did he part company with his kind? And why is there no trace of any other animal who has made a similar advance, if not in degree, then in kind?"

Mechanical Hints.

To MEND TIN OR IRON WARE.—Leaky tin or iron ware is easily and quickly mended by hammering a small nail or tack of soft lead, to fit the hole; or cut off each side, and rivet it down. Rivets of soft iron or other metal may be used to mend iron kettles, etc.

CEMENT FOR IRON AND STONE.—Glycerine and litharge stirred to a paste, hardens rapidly, and makes a durable cement for iron upon iron, for two stone surfaces, and especially for fastening iron in stone. The cement is insoluble, and is not attacked by strong acids.

To CLEAN MARBLE.—Mix a quantity of the strongest soap lye with quicklime, to the consistence of milk, and lay it on the marble for 24 hours. Clean it afterward with soap and water. Or else use the following:—Take two parts of common soda, one part of pumice-stone, and one part of powdered chalk; sift through a very fine sieve, and mix with water. Then rub it well all over the marble, and all the stains will be removed. Then wash with soap and water as before, and all will be as clean as it was at first.

GAS AS A SUBSTITUTE FOR GUNPOWDER.—A Frenchman has suggested the use of common illuminating gas as a substitute for gunpowder, in forts and other stationary batteries. The "chamber" would have to be considerably larger than required for powder. The principle of loading and discharging is the same as that employed in the Lenoir Gas-engine. It is said that two cubic feet of gas will throw a 60lb ball—how far is not stated.

A HINT FOR INVENTORS.—It was stated before the late Scientific Association at Troy, N. Y., that any one who should discover a method of eliminating the phosphorus from cast-iron in the Bessemer process will have discovered something of more value in a financial direction than the original discovery of the Bessemer process itself, because it would render available pig-iron of ordinary cheapness, whereas the irons now used are very costly.

It is said that kerosene applied by means of a moistened cloth to stoves, will effectually keep them from rusting during the summer.

TRACTION ON ROADWAYS.—The force required to draw one ton on a level road is 147 pounds; on a broken stone surface, 65lb.; on a good stone pavement 33lb.; on a railway, 8lb. In other words one horse will draw on a railway more than four can draw on a stone pavement; more than eight can draw on broken stone surface and more than eighteen can draw on a common level turnpike.

Household Receipts.

ALMOND CUSTARD.—Blanch and pound four ounces of sweet almonds and a few of the bitter ones. Boil them five minutes in a quart of milk, sweeten to your taste, and when blood warm stir in the beaten yolks of eight eggs, and the whites of four. Heat it and stir till it thickens, then pour it into cups. Cut the reserved whites to a stiff froth, and put on the top.

COCONUT JUMBLES.—One pound of sugar, half a pound of butter, four eggs, one pound of flour, half a teaspoonful of soda. The milk of the nut. Just before the baking stir in the grated cocoanut. Drop it on tins.

COCONUT CAKE.—One large cocoanut grated, three cups of sugar, four eggs, one cup of butter, one teaspoon of soda, two teaspoons of cream tartar.

SOMETHING NICE.—Beat three eggs very light, stir them with one pint of milk, slice some bread, dip into the eggs and milk, fry to a nice brown, sprinkle powdered sugar and cinnamon on the top. This is a French treat.

To MAKE MOLASSES CANDY.—One teacupful of molasses, half a teacupful of any kind of sugar, a teaspoonful of vinegar, a piece of butter half the size of a nutmeg. Put the whole in a skillet, on a hot fire, and boil exactly ten minutes, stirring it all the time. Then set off to cool. Pull it as soon as it is hard enough. Boiling it twelve minutes will make it too hard. Eight minutes will not be enough. Ten minutes by the clock is the exact time.

Put dried fruit in common muslin, bags with a little saffron bark scattered through, a handful of bark to a bushel of fruit, and no worms will trouble it.

To MAKE OLD KID GLOVES NEW.—Make a thick mucilage by boiling a handful of flaxseed; add a little dissolved soap; then when the mixture cools, with a piece of white flannel wipe the gloves, previously fitted to the hand; use only enough of the cleaner to take off the dirt, without wetting through the glove.

Life Thoughts.

TEARS—Weep for love, but never for anger; a cold rain will never bring flowers.

WHEN you are angry don't write. Words when spoken are air, but when written are things.

SELF-CONFIDENCE.—Never look for your ancestors or your titles in the imperfect records of antiquity; look into your own virtues and the history of those who loved to be benefactors to society.

SPEND WISELY.—Look most to your spending. No matter what comes in, if more goes out you will always be poor. This art is not in making money, but in keeping it; little expenses, like little mice in a barn, when they are many, make great waste.

CHEERFULNESS.—The persons who in deed and truth benefit the world by their labor; who here remove a weed and there plant a flower, and must be cheerful; and they must and will take happy views of life and its contingencies.

LITTLE THINGS.—Hair by hair, heads get bald. Straw by straw, the thatch goes off the cottage, and drop by drop the rain comes in the chamber.

The day of death is scarcely more momentous than every day. Both alike close another door on the past, and open a new one for the future.

LOVE.—True and pure love is never selfish. It has for its aim the happiness of its object, and life seems to be valuable in a degree as it permits one continuous striving to effect it.

A WIFE'S LOVE is the golden chain which unites her to her husband. It has a thousand delicate links, forged by sympathy, self-respect and mutual confidence; sever but one of them, and the chain is as completely broken as though a hundred were destroyed.

FARE hard and work hard while you are young, and you have a chance of rest when you are old.

Make no Man feel his Inferiority.

Nothing is more insulting than to take pains to make a man feel his inferiority in knowledge, rank, fortune, etc. In the first place it is both ill-bred and ill-natured; and in the two latter articles it is unjust, they not being in his power. Good breeding and good nature incline us rather to raise people up to ourselves than to mortify and depress them. Besides, it is making ourselves so many friends instead of so many enemies. A constant effort to please is a most necessary ingredient in the art of pleasing; it flatters the self-love of those to whom it is shown; it engages and captivates more than things of much greater importance. Every man is, in some measure, obliged to discharge the social duties of life; but these attentions are voluntary acts, the free-will offerings of good-breeding and good-nature; they are received, remembered, and returned as such. Women, in particular, have a right to them; any omission in that respect is downright ill-breeding.

THE MAN OF PLEASURE.—He has his little clouds at the brightest; the course of his happiness is retarded by a straw; and any considerable—scarce considerable—accident puts it quite to death. Not only the necessities or conveniences, but the decorations and superfluities of life, are vital to his sickly felicity. In any of them it is possible he may find felicity. In any of them it is possible he may receive a deep or deadly wound.

SELF-HELP.—He who has not learned the lesson of resolute self-help has made little progress as a student, has grown little toward real manhood. Half the world refuses to do its own thinking, to toil through the solution of its own knotty problems; hence, half the world who will not do this must be subject to the other half who will.

FRIENDS.—Gain a friend by a quarrel, if it is possible; never lose one, however—this is possible; for there is a peculiar mode of conduct, even when dissension reigns, that commands veneration and generates esteem.

The line of conduct chosen by a young man during the five years between fifteen and twenty, will, in almost every instance determine his character for life.

Seen from the high altitudes reached by balloons, the blue of the firmament becomes an intense black, and the stars glitter in a back-ground of perfect jet.

Gold and Legal Tender Rates.

San Francisco, Thursday, Oct. 27, 1870.—Legal Tenders buying @89½; selling @90. Gold in New York to-day 11½.

THE LATE FIRE.—We understand that Messrs. Miller & Haley, whose mill and stock constituted the heaviest loss in the disastrous fire on Fremont and Besle streets last week, will soon resume work in another location. Their own workmen and business friends have offered them every encouragement. Their total loss was from \$80,000 to \$100,000; insured \$9,000. One hundred hands were employed, some one-half of whom were carpenters and mechanics, owning tools, all of which were lost, amounting probably to over \$5,000. Other losses are estimated to be as follows: Eureka File Company, \$1,000; Fisher and Jamison, blacksmiths, \$2,000; Glasgow Iron Works, \$15,000, mostly covered by insurance; Duun, grocer, \$5,000; Eureka Bating Factory, \$2,000; Summit Ice Company, not given; Geo. T. Casebolt & Co., \$50,000, insured for \$20,500; Sargent Brothers, \$4,000; Grant, and Strahan, carvers, \$7,000; Heirddink & Co., tobacco mfrs., \$8,000. The recent grading of the street caused the locations of the gearing in the basement beneath Miller & Haley's building to be dark, and it is the opinion of Mr. Miller that the fire took from a heated journal during running hours.

Since writing the above we learn that Miller & Haley have leased the large mill of some 160 ft. front on Berry st., between 3d and 4th, and commenced operations anew on Thursday. Mr. Miller is an experienced millman, and his firm successful in the past, we hope will be more abundantly so after their disaster.

THE STATE NORMAL SCHOOL.—On the 20th inst., the corner stone of the new Normal School building was laid at San Jose, under the immediate auspices of the Masonic Fraternity, assisted by the Odd Fellows. The part of the structure to be built at the present time will be 172x160 ft., three stories high, with a tower 152½ feet high. The architect is Theodore Leuzen. The ceremonies of the day passed off pleasantly, a large number of persons being in attendance. Rev. O. P. Fitzgerald, Superintendent of Public Instruction, delivered the address.

The City Census.

The United States Marshal has prepared for publication a table of the population and property of San Francisco according to the figures collected by the Census agents. These returns are exceedingly interesting both to the inhabitants of this city, and to those of the whole coast, who are all concerned, more or less directly, in the growth and progress of the chief city.

The total population is set down as 150,361. Langley's Directory made it higher, giving 161,250 as the total permanent population, with an estimated addition of 9,000 "floating." The census returns show an increase of 93,559, or nearly 166 per cent, during the last ten years, which is a considerable gain over the increase from 1850 to 1860.

We have in the city 11,817 Chinese, 1,094 colored and 49 Indians. We have, out of our 150,361, 7,667 adults who cannot read or write, that is about one in twenty. And of these 6,882 are natives of Ireland, 9 are white natives of the U. S., and the rest came from various foreign countries, principally Italy and Mexico. This leaves the Chinese out of consideration.

The valuation of the real and personal property is set down at two hundred and sixty millions of dollars, or an increase of two hundred and twenty six and a half millions in ten years, according to the figures given, which is certainly large enough to satisfy all reasonable expectations.

The few figures we have given show a most satisfactory progress in our city. How we shall continue to prosper in the future, will depend much on the settlement of other parts of the State. What San Francisco now particularly needs, is to have the interior filled up with a good industrious population, and we shall not be at all envious of the rapid growth of the interior cities and towns. Indeed, this city is large enough in proportion to the population of the Coast, and to keep up our business interests, we need a well filled surrounding country to back us up.

A Law Dictionary.

We think that Mr. J. F. Cowdery has done an excellent work in compiling, and A. L. Bancroft & Co. in publishing, the "Pacific Law Encyclopedia" which has just been laid on our desk. Similar works have been put before the public at the East, and have been shown to be of exceeding value to all classes of persons; for there are but very few individuals who do not need, at one time or another, some legal advice in their practice. Indeed the man of business—whatever that business may be—constantly finds necessary the proper forms required in the execution of his purposes, and for the proper use of these forms, a knowledge of the legal principles and rules applicable thereto is equally necessary. And as there is so much difference in the legal practice of the Eastern and the Western parts of our country, there has been hitherto, as far as we are aware, no book which covers the important field of this one. Here all the more important classes of transactions between business men, and especially such as require to be performed with legal precision and involve instruments in writing, have been considered, and explanations, rules, laws, cautions, etc., given in connection with them. We believe that the book is calculated to save expense to, and otherwise benefit, merchants, miners, farmers,—in short all who have not the inclination, time and money for consulting attorneys on every occasion when legal advice is wanted.

The suit between the Cole M. Co. and the Virginia and Gold Hill Water Co., has been decided in favor of the former.

THE OVERLAND.—The passage of the days brings again to our office this welcome monthly visitor, and in its pleasant companionship, this time we wander to the Big Trees, down to San Diego and its Gold Mines, up North to the Aleutian Islands, and awsy east to the Imperial Prison, where Napoleon sits and mourns. We come back and visit the Yuba and hear its history; we examine "the Bed of the River" for its suspected treasure; and we pass an evening in a California garden, where we can improve our knowledge of useful subjects by reading about the Angora goat; or, if otherwise inclined, hear about the Saber of Honor, or, possibly, cry over Spilled Milk, or listen to Grandmother's Story and the Iliad of Sandy Bar. And then we shall have still untouched the Career of an American Princess, and shall not have been at the "Presidio" at War Time, nor have attended to the rhymed address to the Statue on the Capitol at Washington, the story of a Hope and that of the Cocoa Tree.

THE NEW GAS.—Of the numerous classes of invention devoted to cheapening the production of artificial light, that of the "New Gas Machine" Company, 407 California street, is attracting very considerable attention. The process consists in passing hydrogen, generated in the machine, through a hydro-carbon liquid, in a series of chambers; and the resulting gas burns with a most brilliant flame. The inventor claims that his process obviates the difficulties experienced in other methods, and has received many strong testimonials with regard to its superior excellence. At the American Institute, last year, this "Dunderdale" carbo-hydrogen gas apparatus was awarded the first premium.

A CALIFORNIA INVENTION AT THE EAST.—Mr. Evan T. Rogers, of San Jose, who last year invented and patented, through the SCIENTIFIC PRESS AGENCY, a tool for marking boot counters and straps, for sewing of seams, etc., has returned from the East, where, we understand, he was successful in introducing his device. It consists of a die stamp, to be pressed or driven upon the leather. It is time saving, accurate and leaves a channel or depression that lets the stitches below the surface so as to be protected from chafing out.

MINING AND BLASTING POWDER.—The gunpowder of the Oriental Powder Company is a very carefully prepared compound, which is said to be of most superior quality. It certainly enjoys an excellent reputation and is widely used. It is claimed to be of very great strength and to have far more effect than the usual brands sold. The matter of explosives is most important to our miners, and we can recommend them to test for themselves the merits of this powder. With the testimonials given, it certainly deserves trial.

LIVERPOOL COPPER MARKET.—The copper trade is exceedingly dull. For a long time the prices have been very low and the prospects are not particularly encouraging. Lewis & Son's October report quotes ore and regulus at 12s to 12s. 6d per unit, bars at £62 to £62 10s, and ingots at £68 to £69 per ton. We see that one of the largest and most flourishing works, the White Rock Copper Works, on the Swansea River, run by Williams, Foster & Co., in connection with H. H. Vivian, has been closed. This is to be greatly regretted.

The monthly "Mail and Express Directory," published by F. R. Voigt, of San Francisco, we find a most convenient reference. It contains the post offices of California, Wells, Fargo & Co.'s Pacific Coast offices, the time of opening and closing the mails at each place, etc., and also the stamp duties.

Our Home Industries.

San Jose Woolen Mills.

This establishment, which has commenced running the present year, has been built by a joint stock company, and is probably as complete, in all its conveniences and arrangements, as any mill of the kind on the coast.

The main building, which is 50 by 110 feet, and three stories high, is thoroughly braced and supported with timber frame work, and is a substantial structure.

The machinery is of the best obtainable patterns and workmanship. Nothing necessary to the perfect manipulation of wool into the best of woolen goods seems lacking, while the object is to excel. Already the warm flannels, the excellent cloths and soft heavy blankets, made here, have an enviable reputation.

There are six complete sets of machinery in the mill, one-half of which are now in use; and the rest will be in readiness to commence soon.

On the first floor of the main building are the picker bays, burring machines, card breakers and finishers; also the wet-finisher-room, in which are the washing machines, fulling mills and jigs.

On the second floor are 24 looms—eight fancy and 16 plain—from the Compton Manufacturing Company, Mass.; also spooling machines. The dry finishing department is on this floor, including shearing machine press, heating box, etc. The shearing, or "flock" is used East to "full" the cloth—a cheat—which soon wears out. This is not used here, but is sent East and sold to "honest" manufacturers of cheap goods.

On the third floor are the spinning jacks, eight in number, each having 140 spindles, four of these are in use at present.

The engine is an 80-horse power, occupying a wing from the main building. It is a beautiful and smooth working piece of machinery, built by Todd & Rafferty, Paterson N. J., with the Wright's patent cut-off and governor. With the exception of the regular clicking of this, one standing close to the engine would scarcely be aware of its motion. It has a fly-wheel 18 feet in diameter weighing over 17,000 lbs. The cylinder is 18 inch with 36-inch stroke.

Outside the main building is the wool barn, in which the wool is stored and assorted. Much depends upon the proper assorting, as the different grade and qualities of the wool, govern the material, as to fineness and fitness.

The dye house contains four baths, with reels and all the apparatus for coloring wools and cloths.

There are also to be seen a scourer for washing wool, the reducing kettle, and bleaching house; also platforms for drying cloth and blankets; and a waste barn.

Every home enterprise that develops our resources, that encourages our intelligent industrial masses to settle, and make homes, that saves the money to our own state and people that might be sent away for labour, or goods,—adds to our civilization and progress,—and should be encouraged.

An hour spent in the examination of such an establishment, as a whole or in detail, is but a glance at something wonderfully perfect or perfectly wonderful. The reflective mind ever takes pleasure in witnessing the working of a nice piece of machinery, and a pride in the achievement of genius, whereby an idea or thought is modeled into plausible being—into living, working wood or iron, becoming material in strength accuracy and purpose.

GOLD DUST.—Mr. Rumley, of Helena, Montana, according to the *Gazette*, has made a collection of gold dust from sixteen different gulches in Montana. He has a homeopathic case with sixteen small vials, each of which contains about a quarter of an ounce of dust from some gulch, a label giving the locality and the coin value per ounce of each specimen. The highest value, \$20.09, is of dust from Highland gulch; the lowest, \$13.64, from Silver Bow; the mean value of fourteen specimens is \$18.06. Mr. R. made the collection for Mr. J. Cavannagh who intends placing it in the Mining Bureau at Washington. Such a collection is extremely interesting and instructive.

*Patents and Inventions.***A Full List of Patents Issued to Pacific Coast Inventors.**

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING OCTOBER 18th.

MEDICAL COMPOUND OR LINIMENT.—John D. Love, Harrisburg, Oregon.

SHOE FASTENING.—Harvey T. Loe, Marysville, Cal.

MORTISING-MACHINE.—Lowell G. Merrill, Angles, Cal.

MEDICAL COMPOUND.—William W. Oglesby, Benton county, Oregon.

PRESERVING AND HARDENING WOOD.—John Lewis Samuels, for himself and Benjamin F. Josselyn, William B. Lake, George G. Burnett, Henry S. Dent, Mary Stirling, George W. Dant, Joel S. Josselyn, and Benjamin R. Nickerson, San Francisco, Cal., and Frederick T. Dent, Washington, D. C., and Henry J. Stone, New York, N. Y., assignees of John Lewis Samuels.—Patent No. 60,794, dated January 1, 1867.

NORZ.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

FLUTING AND BEADING TOOL.—C. E. Boynton, S. F. Mr. Boynton has succeeded in inventing a most useful device which is of particular interest to coach and carriage makers. He provides an improved tool for all fluting and beading, and more especially for finishing of the corners of coach and carriage work. This tool is a beader of novel construction, so formed that several different mouldings can be made with the same tool, and that several beads may be fitted and employed with the same handle. Moreover, an improvement is made in the manner of fastening the beader in place, and another valuable point is the use of a peculiar face-plate, which at once improves the quality of the work and increases the permanency of the tool. It will be seen from this that the invention is one of very considerable interest and importance to the workers of wood.

ADJUSTABLE CANDLESTICK.—F. C. Cone, S. F. Any man who can invent a candlestick which will always keep the candle upright, whatever its size, and thus prevent the disagreeable dripping to a great extent; a candlestick which will enable the candle to be used out of doors, or where there are strong drafts; one which cannot be melted out or broken by being let fall, and which can be easily cleaned; a person who can get up such a contrivance may be reasonably said to have invented a really good thing. Now Mr. Cone claims that his candlestick possesses all these good qualities. It consists of a circular base of wire, from which rise two or more wires which are brought together at the center and twisted, so as to form a sort of stem. The upper ends or hight of the wires are so spread apart and curved, as to form a support for the candle, and may be easily adjusted to suit different sizes. This is the simple device, which has a cup fastened around the central leg, to prevent any dripping of tallow or wax, and may be fitted with a chimney, where the candle is to be used in strong drafts. The material is cheap and durable, and the construction is most ingenious.

FOUNTAIN PEN.—F. C. Cone, S. F. The object of this invention might be said to be to effectually prevent the damaging of carpets or tables, or any article of furniture, by

having ink spilled over them, and to retain the fingers of a writer unstained. It effects these objects, in fact, for it does away with the inkstand, or rather it puts it out of the way inside of the pen holder. For the holder is made hollow, and with a small aperture just within the curve of the pen. A piece of india rubber extends out through this hole and along the inside of the pen to the neighborhood of the nib. This rubber is of such a size that, when contracted, it closes the hole tightly, but if extended (by the movement of a finger, operating a slide and clasp) the ink will be allowed to fill the pen; and the motion of the rubber in the hole will clear out any sediment, and insure the flow of the ink. The top of this holder may have a screw or other device, to let in air, when needed, so that its pressure will allow the ink to flow.

A New Faucet.

After the first problem has been solved,—of obtaining possession of a fluid which

**LORD'S PATENT FAUCET.**

wed desire, another problem presents itself,—how to get the liquid out of the containing vessel. The solution of this problem may be simple or complicated, according to the material of which the vessel is made, the necessity of preserving it in a useful condition, the desirability of no spilling of the fluid, no waste, etc. And as liquids are very often conveniently enclosed in cans of tin or other thin metal, and as it is often desirable to draw off only a portion, leaving the remainder in the vessel until some future time, this problem becomes interesting to a very large number of individuals.

The dry climate of San Francisco has,

**SPONG'S PATENT BLOWPIPE.**

perhaps, had some unexplainable agency in causing the production of the faucet which is here illustrated, and which would seem to be an excellent solution of the aforesaid problem. The construction is as follows:

The rear end of the stem of a faucet, A, of any of the ordinary kinds is provided with screw threads, and a short conical auger, B, is screwed upon its extremity. This auger is hollow, and small holes, *a*, are made through it between the threads, so as to allow the liquid to pass into it and leave through the faucet. The threads of this auger are made quite wide near the

upper end or base of the cone, so that when the auger is bored into the vessel in the usual manner, the actual diameter of the hole made will be equal to the diameter of the base of the cone, less the width of the threads, but a narrow slit will be left by the threads; which will in no way interfere with the perfectly tight joint which is required.

After being bored into the can, the faucet is turned slightly, until the face or ends of the threads bear against the metal between the slits made by them in entering. A rubber or other elastic washer, C, is forced against the metal on the outside of the can by a nut, D, and metallic washer, E, until the metal around the hole is compressed to such a degree as to be perfectly tight. Then everything is ready for use.

This manner of attaching faucets, tubes and pipes to metal cans, at once recommends itself as simple, convenient and effective, as it makes its own hole by boring it in, and can be detached when desired.

erals, and his experiments were continued by Bergman, who published a treatise on the "iron tubs" in 1779. Thence came the important researches of Gahn, forming the foundation of our present scientific use of the blowpipe, and Berzelius following, preserved, in printed form, Gahn's methods and investigations, and in 1820 published his own work on the subject, which work called the attention of the scientific world to the matter and caused many to give it their attention.

One of the most important results was undoubtedly the work of Edward Harkort, a native of Westphalia, a student at Freiberg and finally a Colonel of artillery in the United States, who fought in our war with Mexico and died at Galveston in 1836. Harkort first showed that the blowpipe could be used for quantitative as well as for qualitative analysis, and his work on the quantitative silver assay, printed in 1827, is still extant.

Plattner, then an assayer at Freiberg, where he received instruction from Harkort in preparing the silver assays, continued to study the matter with wonderful diligence, and succeeded in finding methods for quantitatively assaying gold, copper, lead, bismuth, tin, nickel and cobalt. He showed the exceeding usefulness of combining with blowpipe assays the wet method to some extent, and his book on blowpipe assaying is by far the most complete and reliable which exists.

Plattner was succeeded by Richter, who took the Professorship at Freiberg in 1836, and who continues the first in the world in his branch. Prof. Richter has done very much for the blowpipe assay, has edited Plattner's work, in which he has added much that is original with himself, and has shown himself a most excellent teacher as well as a most indefatigable investigator in the realms of sciences.

Naturally with the growth of the "chemistry of the blowpipe," the instrument itself was improved in form. Bartholin apparently had a simple "read" (fistula). Cramer, in 1744, proposed making it of copper with a hollow ball at the curve, so as to retain the moisture of the breath. Cronstedt, Bergman and Gahn all modified the instrument, and the construction adopted by the latter is the one now most commonly used. A practical modification of Gahn's blowpipe is undoubtedly the mouthpiece introduced by Plattner.

As blowing with the mouth is apt to be very tiresome, especially to those who use the instrument only occasionally, or to those with weak lungs, many devices for producing a blast have been invented. Some of these are quite good, others are too complicated to admit of extended use. One of the best is that provided with an india-rubber bag. The form of the lamps, of stands for holding the apparatus, changing the direction of the blast etc., etc., are too numerous to mention here. We close our short sketch with a description and illustration of a new blowpipe "Spong's Patent," which was first described this year in the *English Mechanic*, and to which the *Am. Artizan* has since called attention. The description given of the device, which costs about 75 cents in London, is as follows:

The part, *b*, in the drawing, is filled with sponge level with the top, and when about to use it you saturate the sponge with methylated spirit and light it; on blowing through *a*, a flame 2 inches or 3 inches long is produced, which, as *b* can be turned quite round in its socket, can be sent in any direction; *c*, air-chamber; *d*, brass socket, in which the plug, *f*, fits air tight; *e*, blowpipe. The arrows show the course of the air.

APPLES.—We have received two large boxes of apples, containing rich varieties, from San Jose. Express prepaid. We know they must have come from the choice orchard of C. W. P.

lime before such an instrument. The usefulness of this sort of apparatus was undoubtedly recognized at that time, as towards the end of the 17th century and the beginning of the 18th, we find various propositions as to the best construction of the device for causing the blast. But the blowpipe had no extended sphere, being confined principally to heating or melting on coal, only now and then borax being employed as a flux in this connection.

It was in Sweden that the blowpipe first really became an important aid in mineralogical and chemical work. Von Cronstedt used it to discover the constituents of min-

BILLIARDS.**MESSRS. PHELAN & COLLENDER,**

The well-known Billiard Table Manufacturers of New York, have established at 541 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock. 14v23m

Barnes' Thill Holder.

This coupling can be attached in a few minutes and it is absolutely certain that it will not release itself while the horse is attached. It is durable, noiseless, in good taste, and in short, a perfect Thill Coupling in every respect. The best recommendation that we can send out is the Coupling itself. A full set will be sent to any one for \$5, and the money will be returned if they are not liked. Shop Rights for sale.

Dennis Combination Gridiron.

No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.

This simple and practical Cooker can be used on any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.

A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!

By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest bit is used and the horse's mouth cannot be injured.

No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for sale.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East.

We invite manufacturers and others, to call at our office and make their own investigations.

WIESTER & CO.,

PACIFIC BUSINESS COLLEGE,

Mechanics' Institute, 27 Post Street,

BET. MONTGOMERY AND KEARNY, SAN FRANCISCO.

**THE PIONEER AND ONLY BUSINESS COLLEGE**

On the Pacific Coast where BOOK-KEEPING is taught as practiced in the Counting-room.

PENMANSHIP.

In this useful and very important branch we challenge competition.

PROF. SEREGNI

Has obtained First Premiums at all the Fairs on this coast where his Penmanship was exhibited, and was awarded the MEDAL at the Seventh Industrial Exhibition of the Mechanics' Institute in 1869 over all competitors. His success as a Teacher is unequalled.

TELEGRAPHING.

The only place in the city where Telegraphing is taught by an experienced Operator.

We cordially invite the public to call and examine the merits of the College. Our Institute is patronized by the youth of fifteen and the man of fifty, where they receive instruction in Single and Double Entry Book-Keeping, Commercial Arithmetic, Commission Jobbing, Business and Ornamental Penmanship, Commercial Correspondence, Actual Business, Merchandising, Banking, Importing, Railroad, Steamboating, Mining, Real Estate, Brokerage and Exchange, Mechanical and Architectural Drawing, Telegraphy, Orthography, French, Spanish, Italian, German and English Grammar. No CLASS SYSTEM. Each student receives individual instruction. No Vacations.

Sessions Day and Evening.

Reading for the Hour.

In the White Mountains.—No. 3.

BY ALMARIN B. PAUL.

The climate of the White Mountains is different from any I have heretofore met with in California, especially that along the borders of Wyman and Cottonwood creek. In summer it is soft and balmy, and at the same time exhilarating. In the months of July and August, no day was really uncomfortable from heat. The nights are cool and delightful.

Rains—Water Spouts.

This climate differs, however, in having frequent showers, which occur almost daily, and last an hour or so, always stopping before sundown, leaving a clear atmosphere through which the moon beams with a brightness unsurpassed. As in many high localities of the Sierra Nevada, water spouts are at times visitors. One day I started for a camp 5 miles up Wyman creek, along the side of which a good road was constructed, and arrived at the point of destination just as clouds began to gather. Soon the lightning flashed and thunder pealed, and what terrific claps! There was no confining the horses; they tore back and forth over a small meadow in perfect wildness and fear, while my companions and self sheltered ourselves as best we could. Soon a terrible crash was heard. It was the bursting of a water spout, and down came the water with a roar, tearing up the soil, rocks and trees, in some places 6 feet deep. From general appearances there had been no such deluge for probably 50 years.

Those who have wintered in the White mountains say it is the most pleasant season to work in, it not being very cold and there being little snow. As a mining locality it possesses all the desirable requisites for comfort and success:—plenty of leads, good ore, sufficiency of wood, fine water power, good climate summer and winter.

Pine Nuts—Rabbit Hunt.

My favorable impression of the country was formed under difficulties which generally breed black shadows and discontent. It may seem unreal, but nevertheless is a fact, that a combination of uncontrollable circumstances put our camp on short allowance and I lived for over three weeks on dry bread and coffee and pine nuts. Bread, I have always understood before, was the staff of life, but it's a mistake. Pine nuts have far more "staff" in them. Pine nuts will hold up your strength and grit, and bread will not. It may be asked, Is there no game? to which I will answer, Yes—rabbits. The rabbit hunt which floored our camp may not be uninteresting. The Indians make long nets of a tough weed, and stretch them for a long distance, sometimes for a mile or so. Then all gather for the hunt, bucks, squaws and papposes, large and small, every one that can toddle, hoop, halloo and keep up. They take their position on the outside circle of the plain or meadow, where the raid is to be made—a general movement begins—the rabbits flee before the multitude. The body of Indians keeps contracting the circle until the ends of the net are reached, which they in time take up, and bring finally together, enclosing sometimes a thousand or less of rabbits. The skins are used for winter robes and the meat is jerked for winter. After one of these bunts, it is idle time to look for rabbits.

High up in the mountains are mountain sheep. In one locality there was clustered together any number of horns and bones, which gave the idea of a large herd having at one time been overtaken by a great storm and huddled together and perished. Unless these sheep can be captured by accidental meeting, it is of little use to hunt them, they being now very scarce. Their nimbleness in traveling over rugged cliffs and leaping great distances, is well known.

Ancient Inhabitants—Hieroglyphics.

This country looks old, wild, romantic. There seems a past about it—a tale untold. A race has inhabited it, long, long ago. That such is the fact, several evidences present themselves. Mastodon bones have been found at the foot of the Inyo, a lower branch of the White mountains. Characters, cut on slate, I saw myself at Cerro Gordo, and this time here I found a large

granite boulder, some seven feet in extreme length and about five in breadth, on which were inscribed the hieroglyphics as shown in the accompanying drawing. It was very evident that many and many a year had elapsed since they were inscribed. The work, seemingly, was done by a blunt instrument and was deeply cut, although now, in part, some portions are faint. The gradual decomposition of the granite and their present appearance date their inscription back possibly a thousand years or more. I got the old chief and an interpreter to go with me to them. He looked, shook his head, looked up, said long time. He knew nothing. Seeing I was interested in this, I was informed that high up in the mountains was another large rock, the sides of which was full of hieroglyphics, and the top scooped out in the form of a bowl, in which water was at all times to be had. Not knowing the exact locality, I deferred the hunt for a second visit. If I don't find it, it will not rest long unknown with this wild enterprising American blood now over-running the domain where rich mines are to be found.

San Francisco, Oct 20, 1870.

The San Diego County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

One of the most enjoyable Ocean trips which we have ever taken, is certainly the

marvel of placidity. Its surface is seldom disturbed by even a ripple, save by an occasional storm or the paddle wheel of some passing steamer.

San Diego and its Bay.

The view on entering the bay of San Diego, is one of the most beautiful it has ever been our lot to look upon. The entrance is through a long narrow strait which is protected on one side by high hills, while the opposite side is a peninsula which juts out from the main land, looking for all the world like an island, and which, we are informed, is susceptible of a high state of cultivation. The land upon both sides of this strait is laid off in town lots, as is almost the entire country surrounding the bay. After passing up this narrow strait some three or four miles, the bay curves to the right and opens out into an oval lake or bay, several miles in length, and furnishes a harbor unequalled for safety at all times, sufficient to float with ease five thousand vessels.

The town of San Diego (known as New Town) is situated on the banks of the bay, some seven miles from the entrance or mouth of the strait above mentioned. The

ANCIENT HIEROGLYPHICS.

one between San Francisco and San Diego. The distance between these two points is about five hundred miles, and is accomplished in three days time by the steamers of the N. P. T. Co., one half day being consumed in discharging freight and passengers at San Pedro for Los Angeles, and awaiting the return of the train on the S. P. and L. A. Railroad, which connects these two points.

San Pedro is an old Mexican town built close down upon the bay and consists of a few old and dingy houses, which now appear to be deserted. A new and apparently thrifty town named Wilmington has sprung up on the opposite side of the bay from San Pedro, and is the terminus of the railroad above mentioned. The bay at this place is quite open and would furnish but poor shelter to vessels in a storm.

Most of our readers are familiar with the coast line of California, a description of which would not be of sufficient interest to repeat here. When viewed from the decks of our coasting steamers, few points of interest are presented and none of that romance which attaches to the rugged and precipitous coast line of more northern latitudes; but a sort of monotony prevails which fails to interest, and we gaze at the barren face of the hills endeavoring to catch a glimpse of something to relieve the eye.

The Ocean along this coast is in reality a

site is excellent, rising gradually as it recedes from the bay, and would require none of the filling up and cutting down processes which have fattened contractors in San Francisco. In fact it may be said that it is a natural site for a large city. Two wharves extend out into the bay where the largest vessels can lie and discharge freight. The town is built over an extent of about a mile square, and consists of small wooden houses which are scattered over the whole site, presenting an attractive and quite city-like appearance when viewed from a distance. Mr. A. E. Horton, the proprietor of the town site, has just finished and opened a hotel, which is called the "Horton House," and which would do credit even to San Francisco. Through the kindness of the proprietor, we were shown through the house, and were much astonished at its magnitude and the elegance with which it has been fitted up. The building alone cost \$100,000, and \$25,000 have been expended in furnishing the interior. The proprietor proposes to run the hotel more particularly for invalids who desire to visit San Diego for the purpose of securing the benefits to be derived from the dry and light atmosphere of that locality, as well as to provide a resort for those who desire to pass a season by the seaside. Mr. Churchill, who is well known as the late landlord of the Anzerais House in San Jose, has leased the hotel and pro-

poses to carry it on in the best style. Mr. Horton has also erected several substantial brick buildings on prominent streets of the city, which greatly add to its appearance. We cannot refrain, in this connection, from returning our thanks to the gentlemanly proprietor of the Horton House for his kindness and hospitable proffers during our stay.

Old San Diego,

Or what is known as Old Town, is located some four miles from the new town, and nearer the entrance into the harbor. It consists of a number of adobe buildings and shows no sign of improving. Like most Mexican towns, it is built with a plaza in its center, which serves as a place of general resort on extraordinary occasions. During a short visit to this place we were hospitably entertained by Mr. J. S. Manassee, an old and wealthy resident.

Several other places have been christened and laid out into town sites at different points along the bay, but as yet they are but *paper towns*. Each location has its admirers, who are ready at all times to button hole the visitor and show up his particular choice of location, and produce convincing proof (?) that the future city must be built right there and at no other place. Thus far New San Diego has the lead, and we are inclined to think that it will keep it. At present its streets seem deserted and a great number of the buildings are vacant, but those persons who remain attribute this state of affairs to the extraordinarily dry character of the past season, and are confident that, should a sufficiency of rain fall during the coming winter for agricultural purposes, another year will show a different state of affairs.

Soil.

Notwithstanding the fact that in this locality no rain has fallen for fourteen months, we were shown vegetables of extraordinary growth (and equal to any we have ever seen in any part of the State), that have been raised without irrigation of any kind. This to us seemed extraordinary when we examined the dry and parched condition of the soil; but we were assured that in the low valleys back of the bay no irrigation was required to raise vegetables of all kinds. The only explanation which we heard, in which any attempt was made to account for this state of things, was that the under soil was a hard pan, and that the top soil was a dry loose earth of great richness. The hard pan retains the moisture during the long season of dry weather, and the plant or root which is covered by the top soil seeks the surface of the hard pan and draws moisture from it sufficient to sustain it and give it its full growth. It is certainly a relieving feature in a country subject to drought, to be able, notwithstanding the absence of rain or a convenient method of artificial irrigation, to raise vegetation in the manner which we have described.

A Coal Mine.

Messrs. Farmer and Shermau, of New San Diego, are prospecting for a coal vein which is known to exist about 22 miles north of the city on the coast. They have already sunk three shafts which are now down respectively 71, 85, and 90 feet. The vein can be seen at low ebb tide, and a quantity of coal of good quality has been gathered and sent to different parts of the State as samples. We were shown some samples which we pronounced to be cannel coal. It burns freely and leaves but little ashes. A good coal mine in this locality would undoubtedly be of great value here more especially so as the coal seems to be of a quality not before discovered on this coast.

FANNY FERN has a new book in the press entitled, "Ginger snaps," which will soon be ready; cloth \$1.50.

It is stated that taking a teaspoonful of vinegar will often cure hiccup.

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction.

Scientific Press.
Devoted to SCIENTIFIC and MECHANICAL PROGRESS, MINING, FARMING and MECHANICAL ARTS, contains more valuable READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely illustrated paper on the Coast. Its articles are able, timely and reliable, and written in a more interesting and easily comprehensible style than scientific papers in general. Now in its twentieth volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe. All our best citizens are interested in the scientific discoveries in the development and progress of the three great industrial pursuits named above, which are closely allied on this coast, and are jointly represented in the Press, rendering it a popular and influential journal with all industrial readers. Subscriptions reduced to \$1 a year, Jan. 1, 1870.

For SALE.—An account due this office for advertising for A. Jackson, of La Crosse, Wis., will discount 99 per cent. if necessary.

La Purchasers' Association.
NOTICE.—At a meeting of the Board of Trustees of the Land Purchasers' Association, held Oct. 1st 1870, the following resolution was adopted by unanimous vote:
Resolved, That an assessment of ten dollars per share, gold coin, be, and the same is hereby levied, upon each and every share of the capital stock of the Land Purchasers' Association now held by subscribers thereto; being for the monthly installment falling due and payable Oct. 1st, 1870. Said assessment is payable on or before the thirtieth day of Oct. A. D. 1870, to JAMES F. CROSETT, Secretary, at the office of the Association, No. 304 Montgomery street, San Francisco.
Any stock upon which said assessment shall remain unpaid on the thirtieth day of October, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the 28th day of November, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
J. F. CROSETT, Secretary.

LEA & PERRINS' CELEBRATED Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and Export by the Proprietors, Worcester, Grose and Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, CROSS & CO., San Francisco. 1v20-1reow

THE ASPHALTUM PRESSURE PIPE COMPANY,
HAVING ERRECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities,
Are now Prepared to Take Orders AND MAKE CONTRACTS.
This Company will manufacture Pipe and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-1f

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocos, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

San Francisco Metal Market.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Harratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Elina Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentees, WILKS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS and GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare its perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 16 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL.

For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
Supt. W. P. S. S. M. Co., Philadelphia.

Varney's Patent Amalgamator.

new Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

SALT LAKE CITY Oct. 11, 1870.—Messrs. Dewey & Co.—I wouldn't care or the missing number of the Scientific Press particularly if I did not keep them on file. THE APPEAL,

To Good Templars, and Sons of Temperance. by Mt.
Etna Div. S. of T. No. 38.

Etna, Siskiyou County, Cal. Oct. 2, 1870.

To Brethren and Sisters, in the cause of Temperance, actively engaged in promoting
its interest, this little sheet is sent.

We say, actively engaged, because there are in every Division, and Lodge, some of the opposite character.—These are passive as far as the general good, or permanence of that body, to which they thus belong, is concerned. Not commonly, do this class at first enter the Division or the Lodge, from or with, any particular wish to do, as well as to receive good, from, that connection. Their motives being rather to obtain shelter and protection, from the habit, temptation and company, which, they suddenly fear, is about to overwhelm them. Some acquaintance by intemperance, commits crime or suffers disgrace; or else, by it, is hurried into Eternity.—thereby startling them into an immediate, and lively sense, of their own danger.

On, their fears are awakened by some Lecturer,—drawing in strong colors, the oft-repeated picture, of the inevitable mental and physical sufferings, that surely follow after, the continued indulgence in "strong drink;"—they shudder for themselves; immediately give their names to join the Sons, or the Good Templars. But, are these now fit for Officers?

To those positions our Constitutions permit them to be eligible: even for nominations thereto, directly upon, their admission. By our present short term of office, it is unavoidable, but that should often be the case. These in a majority of instances, cannot have been properly prepared for such responsibilities. Their contest is but just beginning.—They, more often, require to be advised and supported, themselves. Former associations try them, more or less severely, for a long time after their first admission, and always some, soon fall, in endurance of that trial.

If they thus fall out as members, not near as much harm is done. There is, in fact, no good reason, for thus so soon employing new members, save, these changes of Office, which, we think, could be advantageously amended. Say according to those of the Masons, or, of the Old Fellows. By so doing, We can all, have Good Officials, for long terms; and it will encourage all such, to be, on all occasions, fully posted in their duties, and enable them fully, to know all parts of their own work, by heart; so as, often, if not always, to be able to lay aside their cards, "saying their say" clearly and distinctly,—which is a great advantage.

We, therefore, invite the attention of yourself, and your LODGE, or DIVISION, to this resolution, in the hope and belief, that, by being thus placed, under consideration by all these bodies throughout the State, during this Fall, and Winter, it may accomplish much, towards that end.

RESOLVED. In our opinion, the efficacy of our Orders in this State, could be increased, by lengthening the time, in the Terms of office.

RESOLVED, To Appeal to Our Brethren and Sisters, in the Temperance Orders in our State, and elsewhere, for a common effort towards this end. And, that Bro. Dr. Geo. C. Furber, be requested to make this APPEAL, through his Press of the "Cordial of Mountain Balm," beneath our Hall.

Also, Resolved: In this connection, we inform Our Brethren of these Orders, that, for the purpose, of enabling any person "TO QUIT USING SPIRITS," and in Overcoming, Such Powerful Cravings and in Healing all Irritability of Stomach, from Habitual Drinking.

We hazard nothing in saying,—(from our own knowledge in this Division.)—that in this CORDIAL, Has Been at Last Found a Remedy, by aid of which, Any Person, CAN QUIT LIQUOR EASILY,—and be HEALED from its former effects, in a manner surprisingly QUICK to all observers.

By Unanimous Vote of the Members, and signed at the Hall, Etna Cal.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 28, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with salubrious water, under the clothing, twice a week, or oftener, be attended to. Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. "TO CHILDREN also, give it" "little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES. FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs; FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread; FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence, FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL
MOUNTAIN BALM
—AND—
OREGON GRAPE,
Two Plants, abounding on the base of, and on the Mountains surrounding
MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us. Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, FANOO & CO'S EXPRESS to that office which is nearest to the invalid's residence, and that person will be sure to get it. 3v21-12twr

PATENTEES

Who have failed in their efforts to dispose of their rights are invited to consult us, either personally or by mail, free of charge. Many valuable inventions are lying dormant, for want of proper management, that might realize a fortune for their owners, if placed in the hands of competent agents, and brought to the attention of capitalists. We accept only those showing decided merit, as no others can be negotiated. A candid opinion can therefore be relied upon. Commissions dependent upon success. Inclose stamp for full information. Mining Edition.

A New Breech-Loader.

There has been on exhibition in the Merchants' Exchange in this city, for some weeks past, a breech-loading cannon, which has been examined by a large number of scientific and military men, and which would certainly appear a most effective weapon. A full description of this gun, for which patents have been obtained through the SCIENTIFIC PRESS Patent Agency, has already appeared in our columns; but so much attention has been paid to it of late and so much said in praise of its merits, that we think it well worth illustrating at this time.

This gun is a breech-loading needle cannon with a most ingenious elevating and depressing apparatus and automatic scale. It is constructed in three general parts;—the barrel, which needs no further comment; the ring, A; and the breech-pin, B. The ring is of the general form and construction shown in the cut, and screws into the rear of the barrel. Into this fits the breech-pin which is firmly locked in place by means of keys, *a*, (having a cam motion) which play in corresponding grooves, *b*, in the ring, being actuated by means of the lever, *c*. In loading, the breech-pin is removed, the cartridge inserted into the bore, the pin replaced, and the keys made to project into the groove of the ring. The hollow needle, *d*, projects into the center of the cartridge, which is fired (through the vent which extends through the breech-pin and needle) by a common friction primer.

By this construction several important advantages are gained. The gun unites firmness with simplicity in the fastenings of the several parts, and can be worked with less men and fired more rapidly than any other which has come under our notice. And then all that is required to disable the gun is to remove the breech-pin, a most simple and effectual method.

The main difficulty in the successful working of breech-loading cannon has been found to consist in the expansion of the parts by the heat which is necessarily evolved from rapid firing, the fouling of the gun, and the escape of gases. These difficulties are obviated in this invention by making the breech in two parts, so arranged that the expansion of the one neutralizes the effect of the other. It is supplied with a packing of felt and rubber, and a movable face ring of steel, which render the escape of gases impossible; for the greater the pressure, the closer the joint is packed.

The elevating and depressing apparatus and the automatic scale render entirely unnecessary the use of a quadrant in taking elevations, and, at the same time, the gunner will not be so liable to make mistakes as heretofore by the old method. It may be briefly described as follows: Under the barrel of the gun are two eccentrics, *e*, on transverse shafts, which are turned by means of a horizontal shaft, *f*, and worm

gear, shown more fully at C. This shaft is provided with a hand-wheel, and attached to it is an indicator which passes over an index plate, *g*, with degrees marked upon it, which correspond with the arc of the barrel.

In the cannon which have the breech cast on the barrel, there is a vibration, on firing, of the latter part which does not extend to the former, just as in the case of a tuning fork. Now at the point at or near the breech, where the vibration ceases, crystallization of the metal is apt to occur, and of course the piece becomes worthless. By this construction the vibration takes place throughout the whole gun and the crystallization is obviated.

Another cannon has been on exhibition on the street in this city, and has been quite extensively remarked on by the daily

of gunnery and who has made several important inventions relating to the subject, as his improved projectile, etc. Mr. Potter, we understand, is willing to dispose of one-quarter to one-half of his patent rights in this cannon, and those persons desirous of investigating the subject more fully or of entering into negotiations with the inventor, may apply either to this office or to Mr. S. L. Cutter Jr., 410 Kearny street, S. F. Those desirous of witnessing tests of the gun, can be satisfied by taking the Sutter street cars and riding to Harbor View, where the cannon is now on exhibition and experiments will be made for the benefit of those interested.

Co-operation in Mining.

Our readers will find elsewhere in our

POTTER'S BREECH-LOADING NEEDLE CANNON.

papers. This is the so-called "Farrington" gun, a muzzle loader, which claims several very old "novelties," as the central fire, etc., and one or two new ones, the principal of which is the doubtful advantage of hermetically closing the vent to "give the projectile the full force of the charge, and to render it unnecessary to serve the vent with the thumb to prevent premature explosion." This last assertion is rendered exceedingly doubtful by the next advantage claimed, that of being able to "sight through the vent and hole of the gun by means of a tube fitting into the vent chamber," which must be rather difficult of execution when the vent is "hermetically closed;" and the arrangement of firing the gun is a very dangerous one, being liable to cause an explosion at any moment, and being possible to be destroyed with the greatest ease. It is simply a figure 4 trap which drops a heavy wedge through a touch-hole upon a fulminate. A stray bullet, a sabre stroke or a jar might spring the trap and fire the gun, or disable it.

The patentee of the cannon here illustrated is Mr. Abiather F. Potter, of Oakland, who has spent years in studying the subject

columns two articles bearing on this subject, one a communication from White Pine, and the other concerning Mining in Victoria, which are of very considerable interest. The subject is indeed of vital importance to very many of those on whom the prosperity of our coasts depends to a very great measure; and is applicable to all trades and professions. Farmers will find, in the Agricultural Edition, what Horace Greeley has to say to them on this point.

Our White Pine correspondent thinks that co-operation in mining is not to be thought of for the locality concerning which he writes, but adds that, if we had advised it with regard to smelting operations, we would have made a more practical suggestion. If he will turn back to the article on "Separating Silver and Lead" in our issue of August 6th, he will find that we have already hinted at this very thing.

Our correspondent gives several reasons for his assertions, which, coming from a good and trustworthy source, are entitled to consideration as probably representing facts as they actually exist. In our article we had purposely omitted saying how or to what extent co-operation (which our cor-

respondent has rightly interpreted as having been used in a very broad sense, and to a great extent synonymously with "unity of action") should be introduced; for the varying circumstances of the different localities must determine this. Still we think that it might be introduced widely, if the miners themselves would take a square and honest look at affairs.

No miner ought to value his ore merely at the cost of labor employed in extracting it. This value is entirely fictitious except as regards himself. Otherwise a rich ore easily taken from the mine, would be worth no more than a poor ore which demanded an equal amount of labor for extraction. But if several miners would consolidate their claims, they would be able to raise their ore, be it rich or poor, at a much less cost than if they worked each for himself. We think that we can point now to one plain example of this, and if we are wrong, we shall be glad to be corrected by the Central City papers. We understand that the mines on the Bohtail lode at Central City, Colorado, (it is either the Bohtail or the Gregory, and perhaps both) are closed on account of the large amount of water in them. No one mine can afford to pump out all the others at its own expense; and as no agreement could be entered into by the different parties, all are now suffering. Again, each company has its own shaft or shafts, the number of which is entirely disproportionate to the extent of ground worked. A consolidation of these different companies, or co-operation, or unity of action, could enable a large amount of ore to be raised at a much smaller expense than heretofore, would enrich the companies, give employment to many miners now unemployed, benefit individuals and benefit the whole community.

Horace Greeley says that the word of hope and cheer for labor in our days is co-operation,—that is, the combination by many of their means and efforts to achieve results beneficial to them all. We echo the sentiment, and ask the "poor miner," for his own benefit, to lay aside all little petty jealousies and consider the subject fairly and on its own merits.

In the article on "Mining in Victoria" it will be seen how it is there planned to combine the interests of the capitalist and of the poor man for the benefit of the mining industry. Such a plan would hardly be possible here at present, but it is good to look at what other nations are doing. Still we commend the example of a Chamber of Commerce taking into consideration the matter of the troubles and evils of mining and proposing plans for remedying them, to the attention of our American public.

MEDAL FOR CALIFORNIA.—A gold medal has been awarded to the Mission and Pacific Woolen Mills at the Cincinnati Exposition.

LAST week the Suto tunnel was in 1,630 feet, and it was reported that the rock was such as to give expectations of meeting some ledge.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Yuba County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Timbuctoo, Sucker Flat and Smartsville.

In and near these places, are situated the principal mines of this county. I will take them in rotation. The Warren Claim is a specimen of all those at the above named points. J. C. Warren is proprietor and superintendent. The claim is 900 feet front; the width of the hydraulic washings is from 600 to 800 feet; the deep channel is from 50 to 200 feet wide. In times of water from eight to twelve men are employed in this mine. One of Fisher's "Hydraulic Chiefs" is the device for working the same, and is by them very much admired; 2,100 feet of a bed rock flume with three under-currents are connected with the claim, which has heretofore paid to the satisfaction of the proprietor, and the cream of which is considered yet untouched.

Antone Claim, Warren & Edwards, proprietors; Union Co., Hogarth & Co., proprietors; Michigan Claim, McAllis & Excelsior Canal Co., proprietors; Babb Claim, O'Brien & Co., proprietors, known as the Babb Cement Mill and Mining Co., John Boyer, Manager. They have a 10-stamp mill, and crush some 60 tons per day (24 hours). The mill is run by an eight-foot turbine water wheel; working from seven to twenty men. They are also using here a patent device, called a *self-panning out machine*, patented a short time since by F. Hawks; a very clever invention, and in my opinion, a saving of both time and gold. To attempt to describe it would require an illustration, which I have not at my disposal, but may explain in a future article. Up to the time I visited this claim, they had not cleaned up, but from the indications, a big yield would result.

The next in rotation are the Estner or French Claim; next Pactolas Mining Co.; adjoining this is the Yuba River Mining Co.; Excelsior Canal Co. and McAllis are proprietors; cement in character. Next the Pittsburg and Yuba River Mining Co., Brittle & Co., proprietors. They employ seven men, are running a 1,000-foot tunnel, are now in 780 feet. Blue Gravel Co., J. P. Pierce & Co., proprietors, of San Francisco; Nevada Reservoir and Ditch Co.'s Claims, Stevens, Baker & Co., proprietors, of Boston; next, the Smartsville Consolidated Hydraulic Mining Co. From the company's books I took the following item which speaks for itself: "Net dividends since January 1st, 1870, \$5,000 per month." James O'Brien is the superintendent. Next is Enterprise Mining Co., (Sucker Flat), adjoining the Smartsville Hydraulic Mining Co. on the North. Henry Hogarth is superintendent. This Company began a tunnel 2,700 feet in length, on the 10th of October; the entire length of their four foot flume to the Yuba River will be 5,400 feet.

The Excelsior Canal Co. own the principal water privilege here. They have about 100 miles of ditch; the longest in any one stretch, however, is 33 miles. Now, in the driest season, they furnish 3000 inches of water; in winter, 6,000 inches. Blue Point Co.'s tunnel (situated at Sucker Flat) is 2,270 feet long, six feet wide and eight feet high; was finally completed October 1st, 1870, after three years and seven months running, night and day, seven days per week; began February 28th, 1867. During the first year the work was carried on by contract, ranging from \$34 to \$45 per running foot. The contractors, using common blasting powder, made such slow progress, at times six men making only ten feet in a month, that upon the introduction of giant powder, the contractors were released, the work being taken in hand by the officers of the company. They employed six men on each face, (five of them) with single-hand drills, using giant powder. These men were kept constantly at work on eight hour shifts, night and day, until the work was completed. In prospecting this work, 9,000 pounds of steel drills, and 10,000 bushels of coal for the smith-shop were used; 1,327,900 points of drills were sharpened; 94,000 feet of lumber were used for the work shops, etc.; 600 kegs of black powder, 275 pounds of nitroglycerine, 4,400 pounds of giant powder, and 65,000 feet of fuse were used. The proprietors estimate that one-third of the cost was saved in the running of the tunnel after the introduction of single-hand drilling and giant powder, and I think another third could have been saved by the use of the diamond drill, (of which I will speak further along). The entire length of their flume is 4,650 feet, and required 8,000 pounds of quicksilver to charge the same. They are now putting in drifts, or chambers, which will be charged with some 2,000 kegs of powder, and will be touched off some time in December next, by the galvanic battery, the best in use, for with, say ten or a dozen chambers to fire at once, this will do the work simultaneously, thereby giving each the entire strength of the vibration.

The Diamond-Pointed Drill.

At the request of many hundreds of miners and quarrymen, I venture a few remarks upon the subject of the diamond-pointed drill. An annular drill used with its accompanying machinery, which forms the subject of the present remarks, was recently employed in a tunnel of the Consolidated Bullion and Ince Silver Mining Company, Colorado, the tunnel having been

at the time driven 600 feet into the mountain. This drill cut horizontally through 417½ feet of very hard quartz and feldspar rock, the expense for diamonds in drilling this distance being only \$10. This is only one of the daily accumulating proofs of the wonderful industrial value of the opaque diamonds or, as they are more commonly called, carbons, and the great economy secured in their use for cutting and abrading the hardest materials. I cannot, perhaps, place the defects of percussion drilling in a stronger light than by quoting from the report of the Commission to the Paris Universal Exposition. The Commission, after describing M. Sommeiller's machine, which has its solid steel drill attached direct to the engine piston, and conceding its manifest superiority over other percussion borers, proceed to say: "Let us now inquire if this apparatus has answered the expectations of its author, and rendered the service expected of it. We do not hesitate to express the opinion that it has not. If we examine the staff employed in repairing the percussive tools, then used at the Mont Cenis tunnel, we remark that, in 1863, for eight machines working, there were sixty in the shops. At this time (1867), when the work is carried on from both the French and the Italian sides, the number of engines working is sixteen, and the number of those in the workshops repairing is two hundred. Twenty-four men were constantly employed in repairing eight machines."

M. Leschot, of Paris, was the first to conceive the idea of setting diamonds in an annular center, but since his invention many improvements have been added to the same, since its introduction in this country. The diamonds are now securely fastened, and are set so as to give ample clearance, for the free descent of the drill, and the movement of the core through the tubular stem of the ring cutter. Great improvement has also been made in the various working parts of the apparatus, one of the most important of which (to this country) is the driving of, or rotating, the drill by compressed atmosphere, which performs a double purpose,—both rotating the drill and giving pure, fresh air to the tunnel at the same time. One of this kind, to cost \$10,000, with four sets of drills, is now in course of construction for one of the principal companies of Smartsville.

For ordinary excavating, or prospecting, a Hoadley Portable Engine, with the attachment of the drill machinery to the front, would very well represent this kind of a machine. A cut of the Hoadley Engine may be seen in the advertising columns of your paper. Treadwell & Co. are agents. The advantages claimed for the diamond-pointed steel drill are: 1st. That they drill faster than is possible in any other way. 2nd. They perform a given amount of work more cheaply than it can otherwise be done. 3d. They are extremely simple in both construction and operation, and are not liable to get out of order. 4th. They produce holes of uniform diameter, a feature of great importance in blasting, as the force of the explosive material is thereby fully utilized, and its practical effects greatly increased. 5th. They bore equally well at any angle, and are so constructed that very little time is required to set the drill or change its position. They operate without percussion and consume no steel in boring, as the cutting points (composed of rough, uncut diamonds) are practically indestructible. In their application to "prospecting," they accomplish what, without their use, would be wholly impracticable; and, by the use of this drill only, can mines be penetrated eight hundred to a thousand feet through solid rock, vertically or horizontally, and perfect samples of ore taken out the entire depth, disclosing fully the character and value of the mine by means of a single drill-hole. The samples so obtained are continuous solid cylinders, showing clearly the stratification and character of the mine or quarry at any depth. By rotating the drill one revolution backward—the construction being so as to clamp the core firmly and break it off close to the bottom—one brings the core to the surface with the drill. Messrs. Severance, Holt & Co., No. 318, California street, San Francisco, are the exclusive agents for this coast, of whom all information in reference to this most valuable machine can be obtained. Parties wishing prospecting done, artesian wells bored, etc., can have the same done by contract—without being compelled to purchase a machine—at reasonable rates, by the agents.

Brown's Valley—Big Snake.

Brown's Valley, situated twelve miles from Marysville on the Downville road, and eight miles from Timbuctoo, is reached from the latter place via Park's Bar ferry; which ferry is owned by Matthew Woods, and superintended by Jonas Roach, a clever gentleman, who understands navigation at all stages of the water. It is a licensed ferry, and the charge for footmen to cross in splendid boats, is only 25 cents. Animals are crossed at any stage of the water, and security for their safety is guaranteed. Eight years of experience should be a sufficient time to acquaint the ferryman with this portion of the river. As persons representing large monopolies have attempted to injure this humble ferryman, I volunteer this notice.

The Pennsylvania mine is situated in Brown's Valley. Chas. M. Patterson is President and F. W. H. Aaron Secretary, both of Marysville. They have fine hoisting works on the mine, with incline shaft down 600 feet; are at present working the 300-foot level, with fair prospects. A great deal of money has been both taken out and spent upon this mine; the ledges, for they have several, are broken up, run at all angles of the compass, and have all classes and grades of rock; running from one inch to several feet in thickness, and paying from nothing to \$25 per

ton. In days gone by this mine was very badly managed, running the incline at several angles, making it almost impossible to work their pumps; but by some ingenious contrivances they manage to do so. But with its present excellent management, this mine will, in due time, pay. This is not a mine that would at present sell to advantage, but will pay its management to keep. They also have, near by, a 16-stamp mill, with 150-horse power engine, with all the modern improvements.

At a point within two miles of this place (Brown's Valley) is where the great excitement has existed for the past two months in reference to the "big snake," seen and shot at twice by a boy by the name of Rice. He claims that it is 35 or 40 feet long, and 10 inches thick. You have it for what it is worth. The people here believe it. L. P. Mc.

All About Montana.

[CONTINUED FROM PAGE 298.]

Mines Around Deer Lodge.

While in this section I visited some of the principal placer mining camps. One morning I took an early start in one of the stages of Mr. P. B. Clark, who runs a line to Pike's Peak, (otherwise known as Pilgrim Bar) and to Pioneer City (17 miles from Deer Lodge City), and rode to Pike's Peak. This place, 14 miles from Deer Lodge, is a small camp where some very rich mines are being worked by a few companies. The name of Pike's Peak was given by some miners who came from the similarly named locality in Colorado. Pilgrim's Bar is evidently connected with the title of "Pilgrims," applied to those fresh from the States. "Tender Feet" is another name given to the same persons, and it may interest Californians to know that they enjoy at times the appellation of "Self Risers," from the "self-rising" flour the California boys had with them.

This district has a population of about 120 miners in and about the camp. It was in this section that the first gold was discovered,—in Gold Creek, near this place,—and the camp was located in 1862. The mines are from 6 to 30 feet deep to the bed rock, and pay largely when there is sufficient water to work them,—from May 1st to November, generally. In winter it is very cold, and then many of those who have been lucky enough to have made a "stake," leave for other places.

Some eight hydraulic claims are working at present. Rodgers & Co. are doing splendidly. Berry & Co. have made some very large cleanups, ranging from \$3,000 to \$4,000 and even \$6,700 for a 7-days run. Others are doing well, and I see that you keep a pretty good run of them in your mining summary.

Pioneer City, on Gold Creek, where the Stewart Brothers, of Cal., and a few others, found gold in 1862, is a somewhat larger place than Pilgrim Bar, although not so much mining is going on here. The scarcity of water is the cause of the present dullness. I found eight men employed night and day at Young & Co.'s mine, a bank claim 35 feet high, about a quarter of a mile from the city, and taking out \$700 to \$1,000 weekly. The Pioneer claim, owned by Thomas & Co., was started April 4th of this year, and has ten men at work night and day. These have a bank 25 feet high, and are making a large amount of money. The hands get \$6 per day in greenbacks and work 10-hour shifts.

My trip to these places left a pleasant impression. The boys say that they have the best and most lasting claims and such as pay as largely as any in the Territory. I know that there are some pretty nice boys in the camp.

Blackfoot—Carpenter's Bar.

Blackfoot, 25 miles from Deer Lodge and 28 from Helena, on the stage road connecting those places, is a small mining camp on the west side of the Rocky Mountains. On Ophir Bar, near the town, are many claims which have been mined for years. Jordan & Cass, Gallagher & Co., Davis, Dunn & Co., Hogan & Horan, Hill & Curran, Pat. Carr & Co., and Simpson & Co. are the principal claim-owners. All of these are working this year, averaging from \$12 to \$15 to the hand while running, but water is getting scarce and will stop off entirely about December. The bed-rock is granite. The diggings are about 12 feet (bank) or deep. The bar is perhaps six miles long and one mile wide. The water is used over and over again. If there are three claims running the same head of water, it would cost each claim only \$6 per day. It would cost the original company 18 cents per inch. There must be some 300 or more white men around here.

There are likewise about 100 Chinamen around the place. These have bought quite a number of claims, at prices ranging from \$3,000 to 7,500 a piece, and have paid within the last year some \$27,550 (greenbacks) in this way. To-day they purchased a claim for \$7,000. Last Spring one was sold for \$5,000, the working expenses of which this year amounted to \$2,300 and from which \$7,500 have been taken out by them. These items show that there must be some very good mining property in this section.

Carpenter's Bar, a mile from Blackfoot, was located in 1865, is two miles long and a quarter of a mile wide, and has some 12 claims on it, paying from \$10 to \$15 to the hand. J. Montgomery & Co., Pond & Co. and Barnard & Co., all own valuable ground which is being worked while the water lasts. The water is furnished by the Tager Water Co., in which Mr. Hubbard is largely interested. Mr. H. is an old pioneer, well known in this country, to whom I am indebted for much kindness shown.

From here I go to Helena.

W. H. M.

"Co-operation in Mining" (Smelting?)

[Written for the Scientific Press.]

EDITORS PRESS:—In your issue of Oct. 15th, your remark that the best protection of the miner against the over-reaching of capitalists is a system of co-operation among the mining community, by which, as you say, smelting companies would be induced to give prices which could not be complained of, by reason of being able to purchase large lots of ore in the hands of such co-operative mining companies.

Now, so far as your remarks on this head are intended for the mines and miners of White Pine, and particularly of the Base Range, the suggestion is wholly inapplicable and impracticable. The base metal ores of this district are of such an infinite variety of grades, both as to intrinsic value and facility or difficulty of smelting, that no agreement among the owners of ores is possible as to the prices which their commodity shall command in the market. For it may, and often does, cost the miner more money and labor to produce ore of a low grade from his mine than it does some other, more fortunate, to raise ore of a high standard value to the smelter. How can these two classes of ore-producers be made to co-operate in the sale of their ore? Besides, the yield of the mines is not uniform, either in quality or quantity. Furthermore, the method of determining the value of the various dumps, by assay of samples, is objectionable and unsatisfactory. One sample may assay up in the hundreds in silver, and another, from the same pile, may show scarcely five dollars per ton. The only precise method is by assay of the bullion from several tons of the ore. Even in this way, the assay must be frequently repeated, for the reason that the ore from different parts of the same mine may vary greatly in its yield of the precious metal.

For the above and other reasons, not necessary to mention here, the miner thinks his pile of ore should sell at a price not much below that realized for ore of a higher grade. He considers his labor and time worth as much to him as though he had succeeded in producing ore of a high grade. At any rate he will not submit to have the selling price of his ore fixed by those who have been more fortunate. He will rather subject himself to the mercies of the smelter.

But if you had advocated co-operation among miners in smelting their ores, and the leasing or ownership of smelting works for that purpose, your proposition would have exactly suited our condition and prospects. Even now, while I write, a meeting of the miners of the Base Range is being held at Swansea, to perfect arrangements for leasing one or more of the numerous furnaces now lying idle for want of capital to run them, and to consider what is the best plan for operating the same in the interest of all the miners of the district. A committee has been appointed to submit such a plan, and to report on Saturday evening next. The plan most in favor is, for the whole body of the miners to guarantee the running expenses of the works, and receive the entire bullion yield of their several lots of ore, each individual owner thereof paying his *pro rata* of said expenses, in the form of a tariff on each ton of ore so smelted and delivered as bullion. Whether this plan will be finally adopted is uncertain; but your correspondent believes that none will be found to work more satisfactorily. I will take pains to inform you of the system which may eventually be carried into effect.

Rather than that you should entertain a doubt as to the reliability of the statements made in my previous communication, regarding the extortion of the smelters, I refer you to the proceedings of a meeting of the miners, previously advertised, and held at Hamilton on Sunday, Oct. 16th., reported in the White Pine News on the following Tuesday, at which meeting a resolution was passed, to sell no more ore to the smelters except from the dumps. The meeting adjourned to Sunday, Oct. 23d. (yesterday.) I am not in possession of information as to the proceedings at this latter meeting. Much indignation was manifested at the first meeting, at the treatment of the miners by the managers of the Rothschild Smelting Works. The effect of the action of the miners is seen in the fact that the agents of the Rothschild Company now actually purchase ore and agree upon the price therefor, at the mines, instead of requiring the miners, as heretofore, to transport it to the furnaces, without knowing what price would be given for it by the Company. This is certainly one good effect of unity of action, or, as you would call it, co-operation.

As the Press is justly considered the friend of the mining interest, as well as of all other industrial interests of our country, the facts above recited will be as acceptable to its conductors as they certainly must be to its readers. There can be no difference of opinion between you and the producers of wealth in relation to the efficacy of co-operation. The only debatable question connected therewith is as to the method of arranging the details. These must vary with the different occupations, and each is subject to contingencies best known to those actually engaged in them. Many difficulties stand in the way of co-operations and the disposal of ores, some of which I have attempted to exhibit in this communication. But there is and can be no objection to union in the business of smelting, by some method similar to the one above pointed out. At the same time, our thanks are due to the SCIENTIFIC PRESS for these and many other valuable hints upon the subject.

Shermantown, Nev., Oct. 24, 1870.

MINER.

Mechanical Progress.

A "RECIPROCATING FLY WHEEL."—Chas. T. Porter describes the Allen engine in detail in the Franklin Institute Journal for October. We quote a paragraph: "The reciprocating parts of engines are usually so light in proportion to the area of the cylinder, and their speed is so slow and stroke so long, that the force required to impart motion to them, expressed in pounds pressure on the square inch of piston, is but trifling. But in this engine, the reciprocating parts are made as heavy as possible, without giving to them a clumsy appearance, in direct violation of the received maxim, that these parts in high-speed engines must be made as light as possible; then a short stroke is employed, and a speed which is of some use in this respect as well as in others, and thus there is interposed on each centre, between the force of the steam and the crank, the inertia of a mass, sufficient to absorb the former in great measure, and to impart it to the crank during the latter portion of the stroke, when the pressure in the cylinder has fallen by expansion to little or nothing above the atmosphere. The reciprocating parts thus act as a reservoir of force, precisely as the fly-wheel. They become not the mere means by which, but rather the medium through which, the force of the steam is transmitted to the crank. They remedy the great defect of the crank-motion, which is, that at the beginning of the stroke the force of the steam is exerted more directly to punish the engine than to rotate the crank. They remove the serious objection to working steam at a high grade of expansion, that the engine is driven by a succession of blows. They save the crank and shaft and frame from sudden shocks, and cause the engine to run with a gliding motion that is really surprising to witness."

MACHINE MOULDING.—The *Engineer* describes this in an article on the Britannia Iron Works, Bedford, England: "The pattern stands up over a flat cast iron table, a flask is put on the table, parting sand sprinkled on the pattern, and the flask rammed up with moulding sand; a handle is then turned under the table, and a peculiar screw arrangement, not easily described without drawings, is put in action, by which the pattern is drawn down from the flask, which is then ready to take its place above or below a similar flask in which the other half of the article to be cast has been similarly moulded, the cores, if any, being first put in. The speed and facility with which the moulders do their work is astounding to those who are only accustomed to the old hand system. It would not be easy to get a more troublesome thing to mould than the body frame of one of Messrs. Howards' reaping machines. It is, so to speak, all shapes. It is difficult to see how a plane can be driven through it, on which two flasks only, holding the whole mould, will part. As a matter of fact, however, such moulds are made in two flasks only. To mould one of these by hand would certainly take a skilled pattern maker two hours. Two well-grown, unskilled lads did the same work, in our presence, by the aid of this machine, in a little under six minutes."

VELVET FACTORY IN KANSAS.—The Philadelphia correspondent of the *Iron Age* Oct. 13th, says:—"We find an interesting evidence of progress in the establishment of the first velvet manufactory in America, at Franklin, Kansas. This co-operative enterprise is under the auspices of a French colony, superintended by Valetton de Bossiere, and was commenced during the past summer. The first velvet made was brought to St. Louis by M. Fossiere, last month, and pronounced equal to the best French imported. The factory now makes about 280 yards per day. Additional machinery is to be put up, and the manufacture of sewing silk, tassels, trimmings, etc., included."

TANNING COTTON.—*Cosmos* speaks of treating cotton fabrics with a solution of tannin to give them strength and resistance to moisture. *Nature* thinks the change produced cannot be great. In a subsequent number, the last named journal gives a communication from a Northumberland tanner, who says that in that neighborhood the fishermen have for many years been in the habit of tanning their sails and nets with oak bark or catechu. "Not only does it render them more durable, but in some cases where wet nets have heated and become tender, their toughness has been restored by tanning."

THICKNESS OF THE CENTRAL WEB OF RAILS.—Biron von Weber, Engineer of the State Railways of Saxony, has recently published details of some experiments made by him, which we find given in *London Engineering* for October 7th. He desired to ascertain what was the minimum thickness which would be given to the web of a rail, in order that the latter might still possess a greater power of resistance to lateral forces than the fastenings by which it was secured to the sleepers. For this purpose a piece of rail 6 ft. in length, rolled of the best iron at the Laurabütte in Silesia, was supported at distances of 35.43 in., and loaded nearly to the limit of elasticity (which had been determined previously by experiments on other pieces of the same rail) and the deflections were then measured with great care by an instrument capable of registering 1/1000 inch with accuracy. This having been done, the web of the piece of rail was planed down, and each time that its thickness had been reduced 3 millimetres, the vertical deflection of the rail under the above load was again tested, and the rail was subjected to experiment. * * The forces applied were far greater than those occurring in practice, yet it was found that with the web 12, 9, and even 6 millimetres thick, no distortion took place, and only when the thickness of the web was reduced to 3 millimetres (0.12 in.) was a slight permanent lateral deflection of the head caused just as the spikes gave way. * * Baron von Weber concludes that webs 3/4 in. or 1/2 in. thick are amply strong enough for rails of any ordinary height, and that in fact the webs should be made as thin as the process of rolling and as the provision of sufficient bearing for the fish-plate bolts will permit.

NARROW GAUGE SUSPENSION RAILWAY.—A new form is thus described in a paper by J. B. Fell, C. E. "It consists of a double beam of wood or iron, supported at intervals on a single row of pillars. The gauge of the rails laid upon the beams is from eight to eighteen inches, and this is made equivalent to a broader one by the steady power of horizontal wheels working on guide bars which are fixed on the sides of the beams and below the carrying rails. The depth or distance of the guide bars below the carrying rails is equivalent to a corresponding extension of the gauge. When the gauge on these railways is eighteen inches, and the distance of the guide bars below the rails twelve inches, the eighteen inch gauge becomes equal to a 3 ft. 6 in. on an ordinary railway, and carriages of the same width may safely be run upon it. The stability with which these carriages run is also partly due to their being suspended from the axles instead of, as is usual, resting upon them, by which means the center of gravity is brought low. A line upon this system is about to be opened for traffic from the Park House hematite ore mines to the Furness Railway in North Lancashire. The length is about one mile, the gauge eight inch, and the cost, exclusive of stations and stock, £1000. It passes over a somewhat hilly country, at an elevation varying from 3 ft. to 20 ft., is worked by a stationary engine and endless wire rope, and will have a traffic of 50,000 tons per annum. Small carriages have been run on this line with seats for eight people, and at a speed of fifteen to twenty miles per hour they are perfectly safe and steady. * * A locomotive engine has been designed for working upon this class of railways. The weight is from six to ten tons."

LARGEST IRON WORKS IN AMERICA.—The Cambrian Iron Works, at Johnstown, Pa., 78 miles from Pittsburgh, is owned by a stock company of a few Pennsylvania capitalists. Its product is almost solely railway iron. The manufacture embraces every stage, from mining the ore and coal, to the delivery of the finished product. It owns its coal and iron mines, smelts its iron, refines and rolls it, builds its own machinery, makes its brick and mortar, erects its structures, and seldom goes beyond its own resources to procure any of its material. It gives employment to four thousand eight hundred workmen, the result of whose labor last year was seventy-six thousand tons of railway iron, the value of which was five millions of dollars.—*Pittsburg Cor. Iron Age*.

Scientific Progress.

ELECTRIC CURRENTS RESISTED BY LOOSE DUST.—S. A. Varley, C. E., read a paper upon telegraphs before Section A., at the late meeting of the British Association, from which we quote: "The author when experimenting with electric currents of varying degrees of tension, had observed the very great resistance which a loose mass of dust composed even of conducting matter will oppose to electric currents of moderate tension. With a tension of, say, fifty Daniell cells, no appreciable quantity will pass across the dust of blacklead or fine charcoal powder loosely arranged, even when the battery poles are approached very near to one another. If the tension be increased to, say, two or three hundred cells, the particles arrange themselves by electrical attraction close to one another, making good electrical contact, and forming a channel or bridge through which the electric current freely passes. When the tension was still further increased to six or seven hundred cells the author found the electricity would pass from one pole to the other through a considerable interval of the ordinary dust which we get in our rooms, and which is chiefly composed of minute particles of silica and alumina mixed with more or less carbonaceous and earthy matters. Incandescent matter offers a very free passage to electrical discharge, as is indicated by the following experiments. The author placed masses of powdered blacklead and powdered wood charcoal into two small crucibles; no current would pass through these masses of powder whilst they were cold, however close the poles were approached, without actually touching. The battery employed in this experiment was only twelve cells. The crucibles were then heated to a red heat, and electricity freely passed through the heated powder, and on testing the resistance opposed by the heated particles, placing the poles 1 in. apart, and employing only six cells, the average resistance opposed by the blacklead was only four British Association units, and that opposed by the wood charcoal five units."

ATMOSPHERIC CURRENTS.—The following is an extract from a paper read by Mr. J. K. Laughton before Section E., of the British Association at the late meeting:—"Examining at great length into the various local winds and irregularities in the different parts of the world, we arrive at the conclusion that the whole atmosphere has a continued tendency to move from west to east, and does so move when it is not interrupted. The interruptions are of two kinds: one occasional and irregular, caused by fluctuations in the hydrostatic condition of the air, the other permanent or seasonal and regular, caused by the pressure of lines of coast and mountain ranges. It is impossible to say definitely why the atmosphere should have this prevailing motion; but if the cause is neither heat nor the influence of the earth's rotation, nor any agency which we can detect at work on the earth, we are driven almost insensibly to the belief that it must be the result of celestial attraction; and the fact that the barometer shows no trace of noteworthy rise or fall, as of an atmospheric tide, suggests that the atmospheric currents, which must necessarily be formed by the action of such an intense disturbing force, do not in any way clash, but flow uninterruptedly onwards in one certain direction."

BLOOD PICTURES.—Dr. Day, of Geelong, Australia, confirms the discovery of Neumann, that the picture or network formed by human blood can be distinguished under the microscope from that formed by the blood of other animals. A small drop of the blood is to be placed on a microscopic slide, and carefully watched, at a temperature of 54° to 59° Fahr., until the picture or network formed by its coagulation is developed. Human blood speedily breaks up into a "small pattern" network; that of other animals takes a longer time, and makes a larger pattern; but the blood of every animal seems to form a characteristic picture.—*British Med. Journal*.

THE WELDON CHLORINE MAKING PROCESS.—The author of this process described it before Section B. It is one "for the manufacture of chlorine by means of a perpetually regenerated reagent, consisting mainly of a compound containing the elements of peroxide of manganese and lime." We quote: "The chloride of manganese, which results in the ordinary preparation of chlorine, and which is generally acid, is neutralized by adding to the liquor finely-divided carbonate of lime. The liquor then consists of a neutral mixed solution of chloride of manganese and chloride of calcium, and contains, in suspension, a large quantity of sulphate of lime and smaller quantities of oxide of iron and alumina. The clear solution, after settling, is oxidized by passing into it a blast of atmospheric air from a blowing engine, and heated, if necessary, by a current of steam. Milk of lime is then run into the oxidizer until the liquid ceases to give a manganese reaction with solution of bleaching powder. A further quantity of milk of lime is added, and ultimately from eighty to eighty-five per cent. of the manganese is converted into peroxide. The mixture is allowed to settle, the chloride of calcium solution forming the supernatant liquid is run off, and the residual black mud containing the manganese peroxide is used in the stills where hydrochloric acid is decomposed and chlorine gas produced. A residual liquor such as was commenced with, results, and the round of operations is begun again; and so on, time after time indefinitely."

UNDULATORY HYPOTHESIS APPLIED TO SENSATION.—In the course of the discussion upon a paper read by Dr. Brown-Sequard at the late meeting of the British Association, Dr. McDonald, F. R. S., of Dublin, said that he had long felt some difficulty about adopting the hypothesis that there existed distinct conductors for various sensations, as those of heat, pain, tickling, contact, &c. In explanation of the remarkable cases sometimes met with in which an individual who felt perfectly the contact of one's hand yet could not distinguish heat or cold, he proposed another. His hypothesis was, in fact, an application of the undulatory hypothesis to the propagation of nervous sensation—he supposed that sensations such as those of heat, pain, contact, as well as those of various colors, of form, of sound, were waves of different wave-lengths; and that, under certain circumstances, some waves were absorbed or intercepted while others passed on to the sensorium. He drew an analogy or illustration of his hypothesis from Prof. Tyndall's well-known experiments on the absorption of radiant heat by vapors or scents passed into the air filling a glass tube. The glass tube in this experiment represented the nerve tube, the slight change effected in the air contained within it produced by the introduction of the minutest quantity of scent causes an absorption *in transitu* of some waves of heat, others pass. The experiment of seeing the complementary color upon gazing at a white ground after looking upon a colored disc, might be explained thus: A slight chemical change is effected in the nerve tube by gazing at the colored disc; when the white ground is looked upon, all undulations pass through *save* those which are absorbed, viz., those of the color previously looked at. This, of course, gives the complementary color. Many phenomena connected with sensation, Dr. McDonald conceived, would find in this hypothesis a simpler explanation than in that of distinct conductors.

PHOTOGRAPHING THE SUN'S PROTUBERANCES.—Prof. C. A. Young, of Dartmouth College, has succeeded in obtaining photographs of protuberances on the Sun's limb, by attaching a small camera to the eyepiece of the telescope, and opening the slit somewhat widely. In a note to Prof. Morton, announcing the fact, and enclosing a specimen, he says: "As a picture, the little thing amounts to nothing, because the unsteadiness of the air and the maladjustment of the polar axis of the equatorial caused the image to shift its place slightly during the long exposure of three and a half minutes which was required, thus destroying all the details. Still, the double-headed form of the prominence is evident, and the possibility of taking such photographs is established."

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

LEVATHAN—Miner, Oct. 22d: The lot of ore taken last week to Dayton netted \$63 per ton on the dump, and the whole lot of between three and four hundred tons contracted for by the Messrs. Birdsall will pay \$50 to \$60 per ton profit. The mine will be kept at work through the winter.

GLOBE.—The contract is let for furnishing lumber for the new mill, and the first load was delivered to-day.

MR. BULLION.—A large stream of water burst out from the face of this tunnel this week, which is looked upon as a hopeful sign.

TARSHISH.—The winze to connect the upper and lower works of the Schenectady is progressing finely; twenty feet made this week.

THE SILVER GLANCE drift is still in casing, and water coming in freely. Assays this week gave a return of \$36 per ton. All indications are flattering.

AMADOR COUNTY.

ONEIDA—Ledger, Oct. 29th:—C. Waskins has been appointed Supt. The mine was never in a more prosperous condition.

BUTTE COUNTY.

MORE PIPE.—Oroville Record, Oct. 29th: After the pipe for the Spring Valley Water Co. at Cherokee, had been delivered on the ground, it was found that there was four hundred feet lacking. This has been supplied and the pipe will soon be in place. The ditch from the upper end of the pipe is completed to the Concow, which will furnish a supply of water for the winter.

EL DORADO COUNTY.

ITEMS—Placerville Democrat, Oct. 29th: The Alderson claim, at Con Hollow, cleaned up over seven thousand dollars during the past week. . . . The Shepard mine continues to yield ore in goodly quantities. . . . Dickerhoff & Goin are hammering away with good results. . . . The mine formerly owned by C. W. Brewster, called Soap Weed six miles N. E. of this city, has been purchased by a Pittsburg company, who intend working on an extensive scale. . . . The U. S. Grant Quartz Mine is in the hands of a Massachusetts Co. It is their intention to sink two hundred feet.

GOLD DUST.—There has been shipped through Wells, Fargo & Co., in this city during the past four weeks, \$48,000—averaging \$12,000 per week. It is safe to say that as much more has been shipped from other parts of the county. This year, so far, will average \$20,000 per week, besides lots by private hands.

INYO COUNTY.

BULLION.—Independent, Oct. 24th:—Last week there was shipped from the Swansea works 700 bars of base bullion, leaving on hand as many more for which no transportation is offered. From the same cause there is now in Cerro Gordo 150 tons of bullion that cannot be moved.

KEARSARGE.—Extensive improvements are to be made. A wiretramway will be built from the mine to the mill. A ditch is to be run from Little Pine Creek. A 30-inch turbine wheel will supply 400-horse power. Work is already commenced.

CERRO GORDO.—Cor. of same:—The Belmont miners have been running another tunnel to strike their mine at a greater depth, and are in 200 feet. The tunnel will strike the lode 186 feet below the present workings, making a total depth upon the vein of 340 feet. The Wittekind has a tunnel in 115 feet which will develop their mine at the depth of 150 feet from the surface. Mr. Belshaw has sold his interest in the Union mine to Hart and Whipple, owners of the mine above the old Union dump.

LASSEN COUNTY.

BIG VALLEY.—The Susanville Sage Brush of 22d. notes the discovery of a quartz ledge, three miles south of the Eulers & Haskin's claim, which prospects a bit to the ounce, with surface diggings prospecting one dollar to the pan; also rumors of the discovery thirty miles north, of extensive placer diggings.

NEVADA COUNTY.

MANHATTAN.—Gazette, Oct. 26th: A two foot ledge was struck in the mine to-day at perpendicular depth of 130 feet. The ore looks well.

THE STORM.—This morning at 9 A. M. 3.42 inches of rain had fallen. Deer creek had several thousand inches of water running in this morning. Mining in the beds of the creeks will generally be suspended on account of the storm.

STILL BETTER.—The ledge in the bottom of the shafts of the Orleans is now below the water level, fifteen inches wide, of solid sulphuretted rock, with gold visible all through it.

KEYSTONE.—Same of 28th: The Gravel Mining Co. on Montezuma Hill, are running a tunnel to drain their claims, which occupy an area of half a mile square. It is now in 400 feet, and they have 200 feet more to run. The rock is very hard. The width of the channel on their claims is 1-500 feet, and the average depth of gravel as tested by shafts, 150. The gravel pays from the surface down. Thus far they have taken out money enough by hydraulicing the upper strata to pay for running their tunnel.

READY.—Transcript, 26th: In the claims of Irish & Ragon at the Cascades, the tunnel is completed and all arrangements made to turn on water. In these claims excellent prospects have been obtained in the gravel. The Cement Hill claim is to be worked systematically this season for the first time.

OMEGA.—Same of 27th: This will be one of the most lively camps in the county this season. Last season six sets of claims were worked. Three others will be, as soon as the water supply is sufficient, making nine.

RISING SUN.—Same of 28th: This ledge, down Deer creek is eighteen inches thick and contains rich looking sulphurets. There are two strata running through the ledge, from three to five inches wide. The owners have out 200 tons of rock and will soon make a crushing.

GOOD CLEAN UP.—Ten tons of rock from Eddy, Leavitt & Co's ledge, between this city and the Pennsylvania mine, crushed last week, yielded \$391.

PHOENIX LEDGE.—Grass Valley Union 26th: Pat Hennessy, of Allison Ranch has a ledge in Vail's ranch, south of the Allison, 22 inches in thickness, and sunk upon 15 feet only. From this shaft 16 loads of quartz have worked \$20 per ton.

OSBORN HILL.—Same of 28th: This mine, idle for eighteen months, has been leased by a company of practical miners, and started up Monday.

G. V. CONSOLIDATED.—We find that work is diligently prosecuted, and the quartz is looking well.

HOPE.—A correspondent furnishes us the following items: The Co. are contracting for a new bed-rock tunnel, 500 feet long, to be 16 feet lower than any level, and to connect with the cast drift where the richest deposits have been found. This will enable the whole underground mining to be done easily and rapidly, and at a distance of 3000 to 5000 feet without sinking other shafts. . . . 23 lbs. of the hard cement were lately worked under stamps and in a small steam pan in S. P. with excellent results. 500 tons of this cement are now on the dump and a large body of the same is ready for breasting out. From Sept. 17th. to Oct. 29 7 weeks, 473 oz. were taken out, while the mine was worked at great disadvantage by not having the bed-rock tunnel low enough. The old tunnel is being cleaned out, to connect with Hope shaft, so in case of a wet winter, the water will have to be lifted only 70 to 80 ft. by a 12-inch cornish pump.

MORE ENGLISH CAPITAL.—Transcript, Nov. 2d: A sale of the Little York Water & Mining Co's property, in Little York township, has been negotiated. The consideration is \$200,000, the papers have been made and Messrs. Tregillis and Raud, agents for the English capitalists, have gone to London to conclude the trade.

PLACER COUNTY.

THE GRAVES-PUTNAM CLAIM.—Herald, 28th: We on Monday found ten men taking out quartz. We never saw a ledge more favorably located for cheap and expeditious working. The box prepared for receiving the rich specimens, estimated to hold fifteen tons, is now about half full. The site for the new mill is partially graded, and the timber for the wood-work on the ground by this time.

THE CRETUS LEDGE.—No crushing has been had since the twenty-six tons yielding \$34 per ton, but considerable ore has been taken out and new houses built for the rainy season. Lately the boys have struck a two-inch stream of water in the lower shaft and are running a tunnel along the edge to drain it.

EVENING STAR MINE.—Taylor, Quick, Heenan & Co. have within the last week opened down on very rich rock, some of which has yielded as high as eight hundred dollars to the pan. For three months the company have kept working night and day. At a depth of 70 feet they run out a drift seventeen feet to a point where the rock was not so hard, and in sinking found the ledge a foot thick and very rich. They

have taken out to or three tons that will pan out fully \$5,000. The company has a steam quartz mill, pumps and hoisting works, all run by the same engine. The claim is near the old diggings known as "Fiddler's Green."

STRICKER.—A. O. Bell discovered a quartz ledge near Bald Hill some days ago, and has twenty tons out that will yield \$75 to \$100 to the ton. At present the thing bears the appearance of a mixture of talc, rotten sandstone and decomposed quartz, and pans about \$2 to the bucketful.

SISKIYOU COUNTY.

PATTERSON CREEK.—Yreka Journal, Oct. 26th: The claim of Swau & Co., in which the bed rock has been reached, is paying \$8 to \$9 to each set of timbers, or \$6 a day to the hand.

STRUCK GOOD PAY.—Union, 26th: Smith, Hare & Co. of Humburg, who have been for some time running a tunnel in the bank on the North Fork, have taken out dirt that paid \$2.50 to the pan.

SIERRA COUNTY.

ALLEGHANY.—Downieville Messenger, Oct. 29th:—The New York Co. are taking out pay, which calls to mind the flush times of '49 and '50. Lately, one of the Company washed two pans of dirt; in one he got over six ounces, and in the other, five. Thousands of dollars will be realized from the "pay grit" now piled up.

SMITH'S FLAT.—The Buckeye Co. which is running a prospecting tunnel, recently picked up a quartz boulder worth \$500. A two-ounce nugget and five oz. in smaller pieces also.

ROCK CREEK.—The owners of the Adella gravel mine which stopped two years, since, having had a survey made of their claim, find that by running a tunnel a thousand feet in length, they can strike the lead so that they will be able to work to advantage. The lead is the regular blue.

The Bald Mountain are running for the same lead from the Forest City side of the mountain. Another are running for a continuation of the old Uncle Sam ground, supposed to be a branch of the lead worked by the Adella.

FOREST CITY.—Cor. of same:—A number of new enterprises are started. The Bald Mountain Co. was formed to test the question of a lead. A shaft was sunk, and fifteen to twenty feet of gravel, rich, found in the bed rock. They commenced a tunnel, opening into the North Fork of Oregon Creek, and are running it to the lead. It is a tunnel surpassed by none in the County. Already they are in between 400 and 600 feet. The North Fork Co's. tunnel is in 330 feet, all done in eight weeks. Eli Kuapp and others, constituting the New Phase Co. have sunk 60 feet on a quartz ledge that crosses the Live Yankee gravel lead. The ledge is four feet thick, and assays up to \$200 per ton. The old Oregon grounds are being opened by the Shoo Fly Co. The Dutch Co. are preparing to commence work in earnest. Forest City will be a business center when all these enterprises are carried out. Old residents are beginning to come back.

DORGAN FLAT.—The White Pine Company recently cleaned up \$700, in one week working five men. This Co. have run three tunnels into their claims; the first two being too high were abandoned, yet they have received pay for all the labor since they commenced.

ITEMS.—A rich boulder weighing, rock and all, twenty-seven pounds was struck in the Shamrock claims on Fir Cap. The specimen, to say the least, contains several pounds of gold. . . . The Orleans Co., at Little-Grizzly, are taking out good pay. . . . In the Pioneer tunnel, Stover & Hendel have struck soft rock, and are pushing ahead lively. . . . The Caledonia Co., Cedar Grove, recently struck the pay channel. . . . At the new 40 stamp mill of the Sierra Buttes, they are putting in a wheel 60 feet in diameter, the largest on the coast.

SAN BERNARDINO COUNTY.

RICH ORE.—Guardian, Oct. 22:—Dr. Wm. B. Brink paid a visit to Black Hawk Silver Mining District, and returned on Wednesday last, bringing specimens from the mines in which he is interested, that assay away up in the thousands.

NEW ENTERPRISE.—Same of 15th:—A party of miners, mostly from White Pine have determined to drain a flat at Holcomb Valley. It will take a ditch half a mile long, and will open a large extent of probably rich mining ground.

TRINITY COUNTY.

THE DEEP HOLE.—Journal, 29th: The Weaver shaft is down 130 feet. The soft stratum was six feet through and had to be timbered. The men are now at work in extremely hard granite. Wood and gravel are to find and the water is increasing.

BURSTEN.—The big flume in the cañon below North Fork, is no longer in operation. It is supposed that malicious Chinese threw logs in the river above.

Nevada.

COPE DISTRICT.

BULLION.—Elko Independent, 29: During the last fifteen days, Wells, Fargo & Co. have shipped from Cope to San Francisco, \$4,661.

HUMBOLDT.

RAILROAD DISTRICT.—Elko Independent, 26: The Bullion mine is taking out large quantities of rich galena. Pack trains are packing the ore down the hill. . . . The Elko Furnace will fire up again in a day or two on ore from Railroad. Samples of ore have lately arrived from other districts in this vicinity which took well.

COMPROMISE.—Silver State, 28th: After a long siege of litigation between John C. Fall & Co. of the Montewok mine and the Silver Mining Co. of the Arizona, the suit has been quashed by consolidation of interests. Fall retains one-half of the whole.

WASHOE.

CHOLLAR-POTOSI.—Gold Hill News, Oct. 29th: Daily yield 300 tons. The developed ore sections hold out well. The recent extraordinary rise in the stock, was due more to speculation than to anything else.

YELLOW JACKET.—Daily yield 165 tons good ore, from the three lowest working levels. The drift north, at the 1,000-foot level, is not completed to its connection with the winze from above.

DANBY.—The Co. are about to resume operations in earnest. They have put their machinery in operation, and will sink their engine shaft for a new level. Once the shaft down to a proper depth, they will drift for their vein at a point where there are known to be large deposits of rich ore.

OCCIDENTAL.—Owing to financial embarrassments this mine is closed at present. The stock was quoted at two bits a share yesterday.

GOTTLIN CURRY.—Daily yield 85 tons, of very good ore, ear samples assaying \$44 per ton. A seam of fair ore was cut in the United States section, at the sixth floor. It promises to develop into a good sized body.

CROWN POINT.—The incline is down 100 feet below the 1,000-foot level, and the bottom still shows barren quartz. The drift south at the 1,100-foot level, is in 160 feet from the main east drift, and the face continues barren. Daily yield of the upper mine 80 tons, fair ore.

HALE & NORCROSS.—Daily yield 150 tons, mostly from the seventh level, the ore breasts in are looking exceedingly well. The development of the eighth level is being energetically done.

SAVAGE.—Daily yield 80 tons, principally from the eighth level. The Potosi section yields well yet, and a few tons come from the seventh level. The work of developing the ninth level is carried forward at a satisfactory rate.

OPHIR.—No new ore developments. A raise is about being commenced from the south drift at the 700-foot level.

BELCHER.—Prospecting vigorously prosecuted with no new developments, except that the face of the main drift at the 420-foot level, and the raise above it show more quartz; and the ore above the 200-foot level shows improvement.

CALEDONIA.—The Pute and Sapphire mills are kept running on ore from the 200 and 300 levels. The latter gives the best yield.

OVERMAN.—Daily yield 55 tons, principally from the Lambert and lower tunnels, with seven or eight tons from the raise above the 400-foot level.

VIRGINIA CONSOLIDATED.—Main west drift in 695 feet from the shaft, at the 500-foot level. Rock rather harder.

SACRAMENTO & MEREDITH.—Turning out plenty of excellent ore from the upper workings, keeping the mill steadily running.

IMPERIAL-EMPIRE.—Only quartz and porphyry developed as yet in the 1,300-foot level.

HOPE.—This continues its daily yield of 45 tons of \$26 ore, keeping both mills of the company running.

SIERRA NEVADA.—Nothing new. Both mill and mine running satisfactorily.

A GOOD MINE.—The Buckeye mine, near Silver-City, is lying idle at present, but the owners will doubtless soon have it working. The lease of Dmn & Sewell, who have been working it, expired last Monday. The mine is owned by a company in San Francisco. They put an injunction upon the working of the mine on the 17th inst., but the lessees obtained a dissolution, with \$1,800 damages for three days stoppage of work.

FIGHT ON SEVEN-MILE CANYON.—The Enterprise of the 25th says: A battle has taken place between the fighters employed by the Water Company on one side and the Tail Sluice Companies on the other. The fight opened with fists and rocks and wound up with pistols at short range. Several were wounded—one dangerously.

NORTH AMERICAN.—This mine, below Gold Hill is yielding 50 tons of fine ore per day, principally from the third level. They have a very large amount in sight.

LAST QUARTER'S BULLION SHIPMENT.—The bullion shipment from Wells, Fargo & Co.'s office in this city, for the months of July, August and September last, was 1,008 bars, worth \$2,513,377.36.

SUTRO TUNNEL.—Enterprise, Nov. 1st: The Tunnel is now in 1,635 feet. The ground is good, and indications are favorable for striking a ledge soon. No work

has been done in the face for two weeks as they have been bringing up a drain to carry off the water. There will be no stoppages hereafter.

WHITE PINE.

REVIEW.—*News*, Oct. 30th: It becomes more evident every day that mining is settling down to a steady business. The work being done now is mostly by companies, who do not want to sell. In Treasure City during the middle of the day, not a single idle miner can be seen; but the leading mines bear the appearance of a busy anthill.

WARD BEECHER.—This is now one of the leading mines in the District. The first class ore, such as will assay and mill \$500 to \$1,500, is picked out; the rest being sent to the mills just as it comes, giving an average of \$50 to \$75 per ton. The usual 50 tons are extracted daily. Work is going on in all the shafts—and connection has been established, showing one uninterrupted body of ore along the whole length of the claim. The Big Smoky mill has just finished crushing 300 tons, and the Sheba is steadily working away on the same ore. The net profit for the current month was estimated at \$50,000.

EBERHARDT.—Mr. Attwood does not care about getting out more ore than is needed to keep the Oasis mill running. The men are thoroughly prospecting the mine for future operations on a larger scale, which will be commenced in a week or two. The mine is opened now in such a manner that an immense quantity of ore can be taken out with little trouble. Amongst the new developments a drift has been run in virgin ground, where a body of ore has been struck which has never been excelled in the mine.

ITEMS.—South Aurora yields large quantities of ore, and the bullion shipments from the Stanford mill bear witness that the ore is good.... Original hidden Treasure has 35 men at work and is taking out ore which is worked at Tregloan's mill.... Silver Wedge and Silver Wave are going on as usual.... Noonday has struck ore again—averaging \$100 per ton. Appearances indicate a large body.... Anchor has again struck a good streak of ore.... Consolidated Chloride Flat has been leased to the Metropolitan Mill Co. who are working all over the flat, and taking out some fair ore.... Virginia has an improved appearance.... In the Base Metal mines considerable work is being done; and the supply of ore exceeds the demand by far.... Only three smelting works are in blast in the District, and more could find profitable employment.

BULLION.—Tuesday came 10 bars of bullion from the Meadow Valley S. M. Co., to Wells, Fargo & Co. They weigh 1,112 pounds, and are valued at \$17,595.49. On Friday, 9 valued at \$16,095.31.

MACHINERY for the International Mill is arriving. The kettles for the Matterson refining works have come.

BOULDER.—*News*, 26th: Thompson & Peabody, on the Stoughton have 30 inches of solid iron and copper pyrites.... Mitchell & Williams last run of the Long's Peak mill in ward, for two weeks, produced \$1,000.... From July 15th, to Sept. 15th, Botsford, Fullan & Holk made a net profit of \$19,000.

Colorado.

ITEMS.—Central City *Register*, Oct. 26th. R. M. Reese has leased the Montezuma Co.'s property on the Newfoundland lode for 2½ years.... Assays of ore from the Divos lode, Sherman mountain, show \$101 to \$250 per ton. The shaft is 27 feet deep, and the vein 3 feet wide.

GRAND ISLAND ORE.—B. O. Cutter has 2,500 lbs. of ore that assays \$10,000 per ton. This is from the Caribou. This quality comes from the bottom of the main shaft, from indications, the Caribou will yield during the first month of its working, by the present owners, \$60,000.

Idaho.

ITEMS.—*Avalanche*, Oct. 22d.—Things about the Oro Fins are lively. The engine has been overhauled, and everything prepared for winter. The winze in the sixth level of the Golden Chariot, is down thirty feet. Large quantities of rich ore from the stopes of the fifth level. The new hoisting works were at Elko ten days ago. The Bruce Bros., on the Crane & Driggs are taking ore both from the surface and levels below. The last lot yielded \$58 per ton.... Wednesday the Wild Date tunnel was in 56 feet. They have 30 tons of ore, which is being hauled to mill.... The Peby Bros. have four men to work on the Chariot dump.... One pan of Bell Peak ore gave over \$100.

BULLION.—Wells, Fargo & Co. shipped this week, 14 bars valued at \$5,000.

FLINT DISTRICT.—Wankee & Brown have had a good clean-up at Black's mill. We understand it was up among the hundreds.

Utah.

SHIPPED.—*Herald*, 25th: Sixty-seven bars

of bullion, from the smelting works of Woolhall Bros., weighing 8,000 lbs., were shipped for San Francisco, on Wednesday. To-day fifteen car loads—a hundred and fifty to six—of ore leave, twelve going west and three east. Ten loads are from the "Emma" and five from Tintic.

Mining Stocks.

SAN FRANCISCO, THURSDAY EVE., NOV. 3.

Mining Stocks have been quite steady during the past week but the amount of business generally has not been very heavy, except in the case of Chollar-Potosi, Golden Chariot, Savage and Yellow Jacket, of which some quite large sales have been made. The drawing of the prizes of the Mercantile Library lottery caused the adjournment of the Stock Board from Monday morning until Tuesday morning.

During the month of October the following mining companies have declared dividends as follows: Black Diamond Coal Co., ½ per cent., \$25,000; Chollar-Potosi, \$3 per share, \$84,000; Eureka (Cal.), \$10 per share, \$40,000; Golden Chariot (Idaho), \$2½ per share, \$25,000; Gould & Curry, \$10 per share, \$40,800; Hale & Norcross, \$5 per share, \$40,000; Natoma Water and Mining Co., 1 per cent., \$3,000; Sierra Nevada, 50 cents per share, \$7,500; Union (Cal.), \$1 per share, \$5,000. Total amount of dividends, \$270,300. The amounts disbursed during the month of October in 1869, 1868 and 1867 are given as \$99,200, \$160,000 and \$269,000 respectively.

The dividend of the Gould & Curry company is the first declared since 1866. The dividends of the Chollar-Potosi and Golden Chariot companies were 50 cents per share larger than for the preceding month.

During October the Mint in this city coined \$1,800,000 gold, in Double Eagles, and \$75,000 silver, in Half Dollars. The deposits of crude and refined bullion amounted to 125,910 oz. gold and 86,811 oz. silver.

The stock of the Occidental Company was worth \$35 per share in March, 1869, when the first and only dividend was paid to stockholders. It was sold at 5 cents per share last evening, owing to the failure of the company. It is said that the mine abounds in low grade ore which might be profitably worked, and numerous complaints have been made against its management. A new mill has been recently erected at a cost of \$50,000. An assessment of \$60,000 was collected in April and May last, and another of \$50,000 levied in July. This last was rescinded and one of \$15,000 substituted, which becomes delinquent next week. Five cents per share represents a value of \$500 for the mine and mill.

The Daney company are reported as about to resume operations in earnest.

WHAT MIGHT BE.—It is held that America, with her productive power fully developed, would be able to feed four times as many people as now occupy the entire globe.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco:

McCALEN M. Co., New Mexico.—Oct. 12. Capital stock, \$5,000,000 in 50,000 shares. Trustees: J. McCullen, H. G. Walton, W. Willis, S. Heydenfeldt and D. T. Bagley.

GREENVILLE M. Co., Plumas Co.—Oct. 12. Capital stock, \$400,000 in 4,000 shares. Trustees: H. C. Bidwell, A. McIntire, P. Ogden, E. J. Shipman and E. A. Breed.

DEEP SPRING M. AND M. Co., Inyo and Mono counties.—Oct. 17. Capital stock, \$200,000 in 4,000 shares. Trustees: T. Tennant, J. McCloskey, A. D. Watson, O. P. Fitzgerald and A. H. Jordan.

SAN JOSE MISSION LAND CO.—Oct. 17. Capital stock, \$1,250,000 in 500 shares. Trustees: S. S. Tilton, C. F. Wood, E. H. Dyer, N. Hamilton, H. S. Brown, H. V. Herbert and J. A. Amerman.

The following have been recorded in the Secretary of State's office, Sacramento:

S. F. AND SAN JOSE, SANTA CLARA AND PAJARO VALLEY, SOUTHERN PACIFIC AND CAL. SOUTHERN R. R. Co.—Articles of Association. Capital stock, \$50,000,000 in 500,000 shares. Directors: L. Tevis, L. Stanford, C. Crocker, C. P. Huntington, M. Hopkins, C. Mayne and P. Donohue.

KERN ISLAND IRRIGATING CANAL CO.—Oct. 18. Capital stock, \$30,000. Trustees: A. R. Jackson, J. Chester and T. Baker.

VALLEJO COAL M. Co., Suisun Ranch.—Oct. 20. Capital stock, \$50,000. Trustees: J. McAllister, J. B. Frisbee, N. W. Fish, L. B. Misker and O. H. Baldwin.

LINDEN FLOUR MILL CO., San Joaquin county.—Oct. 20. Capital stock, \$30,000. Trustees: J. Patterson, J. R. Fennell, J. H. Prather, W. E. Field and D. Lewis.

Meetings, Elections, Etc.

JULIA M. Co.—Oct. 11. Trustees: S. P. Wells (President), N. J. Jarrow, C. Carter, H. P. Wheeler and G. F. M. Glover. Secretary, A. Wood.

S. F. AND POINT LONOS ROAD CO.—Oct. 11. Trustees: H. S. Gales (President), C. C. Butler (Secretary), L. Tevis, J. B. Haggins and A. Bull. Treasurer, W. K. Van Allen.

NATOMA WATER AND MINING CO.—Oct. 11. Trustees: H. G. Livermore (President), J. Bennett (Vice-President), H. P. Livermore (Sec. and Treas.), H. T. Knight (Supt.), J. H. Redington, J. C. Enler and W. Jarvis.

EUREKA COSE, M. Co.—Oct. 11. Trustees: G. S. Dodge (President), W. Thompson, Jr. (Vice-President), L. Tevis, G. T. Lawton, J. C. Bateman and W. C. Balston (Treasurer). Secretary, W. W. Taylor; Superintendent, J. F. Boyd.

EXCHICOTEN M. Co.—Oct. 17. Trustees: J. Sims, S. Hydenfeldt, J. E. De La Montaigne, W. H. Sharp and A. K. Grim.

U. S. GRANT M. Co.—Oct. 17. Trustees: T. L. Barker (President), L. A. Routh (Vice-President), and J. G. Bray (Treasurer). Secretary, E. Taylor.

NEVADA CONS. M. Co. Trustees: A. D. Carpenter (President), G. D. Weman (Vice-President), J. Scott, R. F. Knox and G. H. Hallatt. Secretary, J. M. Buffington.

RECENT STRIKES.—A deposit of einnarhar has lately been discovered on the ranch of Mr. Joseph Wilson, about six miles north of Vallejo. The specimens found are exceedingly rich, but as yet the extent of the deposit is unknown. Mr. Henry G. Hanks showed us some very fine specimens which he has placed in his cabinet at 649 Clay street.

We spoke a couple of months ago of the discovery of Hayasine (hydrate of lime) in Nevada, specimens of which were analysed by Mr. Hanks. We see that, on the 22d of October, a load of 9,000 lbs. from near Columbus District, Nevada, arrived at Wadsworth for shipment to this city.

Some beautiful specimens of fibrous gypsum, from San Ramon Valley, Contra Costa county, have been shown us. They are exceedingly fine.

OMAHA SMELTING AND REFINING WORKS.

—From the *Omaha Tribune*, of October 17th, we see that the erection of smelting works at Omaha is a certainty. Probably the furnaces are now in the course of construction. A company has been formed with a capital of \$60,000, all paid, and has organized with a Board of Directors consisting of Messrs. C. H. Downs, W. H. Pier, Gen. Lowe, A. L. King and C. W. Mead. Mr. King's name is mentioned prominently among those to whom the organization of the company is principally due. Mr. L. Ballbach, of Newark, N. J., is General Superintendent. The works are to have a capacity of reducing from 16 to 20 tons of ore daily.

FIRE.—Two telegrams within the past week bring us bad news. One, dated Nevada, Oct. 27, says, intelligence is just received here of the total destruction by fire of the town of Centreville, Idaho, on the 24th inst. Fuller particulars are expected by the next stage. The other, dated Grass Valley, Nov. 2, reads, the town of Moore's Flat was destroyed by fire. Loss, \$13,000. The Masonic Hall, and Marks & Co's. Bank were destroyed.

PETROLEUM.—The petroleum wells in Surdam's Cañon, says a San Buenaventura telegram of Oct. 22d., are now flowing freely, and a large quantity of oil is being shipped to various places on the coast.

GEOLOGY AND HEALTH.—At the late meeting of the British Association, at Liverpool, Dr. Moffat read an interesting paper, showing that the soil has an influence on the composition of the aereal plants grown upon it, and on the diseases to which the inhabitants are subject. The district in which he practices, consists geologically of the carboniferous and of the New Red or Cheshire sandstone systems. The inhabitants of the first are engaged chiefly in mining, of the second in agriculture. Anemia with goitre is very prevalent among these living on the carboniferous system, but is almost unknown among those residing in the new red sandstone. An analysis of the soil and the wheat grown shows a predominance of iron and of phosphates in the latter region, and to the deficiency of those substances in the carboniferous districts he ascribes the great liability to anemia, which is a condition in which there is a want of the amount of oxide of iron naturally contained in the blood. Dr. Buchanan, in commenting on the subject, said that the fact had been established that dampness of the soil is a powerful cause of consumption, and in several localities the drying of the soil has greatly reduced the mortality from this disease.

A LARGE AMETHYST.—The Toledo (Ohio)

Commercial has the following. We would remark that amethysts are of a clear purple or bluish-violet color, and that the brown variety of quartz crystal is smoky quartz: "Capt. John Buck, of Sandusky City, has presented an amethyst block to Judge Fitch. It is about eight or twelve inches in size, and the top is composed of what has the appearance of being irregular blocks of amethyst, the central portion being prismatic in form, of a light brown color and as smooth as glass, while the outer blocks are square, and have a metallic coating, somewhat resembling unpolished silver. This fine specimen was taken from the new and rich silver mines on the north shore of Lake Superior."

SURVEY OF PLACER MINING CLAIMS.—In a recent letter of instructions from Hon. Sherman Day, U. S. Surveyor General for California, to D. B. Merry, Mineral Deputy of this District, he states that placer mines may be surveyed upon unsurveyed land, and afterwards made to conform to the legal subdivisions the same as in case of unsurveyed pre-emption claims. Also that ten acre tracts can be taken in other than a square form, i. e., either 40 rods square, or 20 rods by 80, the long sides extending either east and west, or north and south.—*Placerville Democrat*.

We are sorry to see that the trouble between the Virginia and Gold Hill Water Co. and the owners of sluice claims has led to a resort to violent measures, which will not affect the result at all. As to which party was in the wrong in this case, we are unable to say; possibly both were. So much is certain, however, that shooting or pounding heads or burning buildings is not the proper way to settle a dispute.

GOLD IN OHIO.—It is reported that a gold vein has been discovered at Garrettsville, in Northwestern Ohio, and the excitement is great. All the land in the vicinity has been leased by a company of capitalists. The most remarkable fact in this connection is the assay value given of the rock,—only \$19.50 per ton. Heretofore in such cases it has been the custom to give values in the thousands.

COAL.—A seam of good coal is reported as having been lately discovered about two miles from Elko.... The *Arizona Miner* reports a new coal discovery 20 miles north of the new post east of the Verde. The layer is said to be about 4½ feet thick and of good quality.

OPERATIONS on the Sulphur bank, in Lake county, have been re-commenced, and it is determined to send forward five hundred tons this season. All the products of the mine are forwarded by team and railroad to Vallejo.—*Appeal*.

Angora Goats and Long Wool Sheep.

Wm. M. Landrum, of Watsonville, Santa Cruz County, exhibited a fine lot of Cotswold sheep and Angora goats at the State Fair in Sacramento which we take pleasure in noticing.

He exhibited a hornless Angora ewe—the only one on the ground—that had a fleece very remarkable for fineness. He said that he had a hornless buck, the only pure blooded one in the United States, and that this hornless breed will produce more fleece, with less coarse hair, or “kemp,” than any other breed. His hornless buck will shear 10 pounds to the yearly fleece, worth \$1.25 per pound—while the herd will average 3½ pounds per fleece. He also showed five ¼ grade Angoras with common goats that were really very fine—looking so like the pure breed as to deceive any but a practiced eye.

The advantage in crossing is to improve the common goat,—which is profitably done in this way,—and the fleece of the goat so graded soon becomes valuable—the skins are worth more for mats, robes, etc.; while the mutton is greatly improved by the first crossing.

Mr. Landrum claims to be the first to import the Cashmere or Angora goat to this State, which was in 1861; and he claims that this enterprise is one of great importance to the State. Goats are easily kept; they are healthier than any other domestic animals; the meat is better food than beef or mutton, while the fleece is as profitable as that of the sheep.

Mr. Landrum also exhibited a lot of pure Cotswold sheep which he insists are more profitable to the farmer than short and fine wool sheep. He says: “We can produce combed wools for less price per pound than short wools, and realize 100 per cent. on wools; and 50 per cent. on mutton, and meet with more ready sales by breeding to coarse, long-wool sheep. * * *

The wool from these sheep loses only 15 to 25 per cent., in scouring; while Merino wool loses 60 to 78 per cent.; hence the manufacturer can pay double the price for it and make the fabric for the same price per yard.”

“This class of long combed wool brings double the price of short, fine wools.

“We import annually nearly one hundred million dollars worth of wool, and woolen goods, mostly of a class of long wool, that could be produced at home for less than one-half what it costs us to buy the same.”

Among the sheep exhibited was the imported buck “Prince of Ontario,” which sheared 20½ pounds. He weighs 330 pounds. Another Cotswold buck, “Wm. Wallace,” which weighed 378 pounds, at two years of age, is now four years old, and if fat, would swing 500 pounds.

Four extra fine ewes, with three choice buck lambs were also shown.

His Cotswold ewes averaged 10½ pounds of fleece this season. Their superior weight and quality of mutton, as also hardiness and healthy habits are qualities of much weight in breeding.

Cotswold Lambs.

Mr. L. kept a record of his first pure bred Cotswold lamb, last season. It weighed 14 pounds at birth; 43 pounds at 30 days old, and 77 pounds at 63 days old; fleece measuring three inches long—thick and beautiful.

POTATOES IN CARSON VALLEY.—Last spring, according to the Carson Appeal, George Chedie planted 150 pounds of “Early Rose” potatoes. On the 1st of October he harvested 1,500 pounds of fine tubers. They had been grown, without irrigation on a dry sandy patch. A gain of one thousand per cent of such roots, in such a locality may be considered as something worth noting, and an additional evidence of the agricultural productiveness of even our most elevated mountain valleys.

PATENTS.—The Patent Office issued, during the month of September, five different patents connected with mop handles.

DESTROYED BY HARES.—William Mawson's sweet potato crop, on Butte Slough, Sutter county, has been destroyed by hares.

A Press for Wine and Cider.

We herewith present an engraving and descriptive sketch of a press for use in various adjunctives to agriculture and the industrial arts. It is a French invention which we have copied from the *American Artizan*. This press is constructed on the principle of the combined screw and toggle-joint. A brief explanation will make its principles and use apparent to the reader.

By reference to the figure it will be seen that the broad base of the apparatus is made of wood, and has its flat upper surface surrounded by a rim which insures the passage of the liquids received from the press above to the outlet spout, by which they are conducted to a suitable receiving vessel. At or near the center of the base

are two upright guides, which have the double function of guiding the follower or plunger of the press and of supporting the superincumbent working parts. The upper ends of these supports are connected by the solid bed-block, A, through which passes the stem or rod of the follower, carrying at its upper extremity a strong cross-bar, to either end of which latter is pivoted the lower extremity of a toggle-joint. The pivots by which these toggle-joints are connected with the cross-bar are indicated at f, g, in the cut. The upper ends of the toggle-joints are pivoted to the top of the frame of the machine by the pivots c, d. Each toggle-joint or pair of toggle-bars carries at its center a nut, into which is screwed the adjacent end of a horizontal screw, the threads of which at its two end portions run in opposite directions. By turning the screw in one direction or the other, as the case may require, by means of the bar, a, the centers of the two toggle-joints may be made to approach or recede from each other and thus raise or lower the follower. Inasmuch as the power of the follower increases in proportion to the straightening of the toggle-joints in forcing the follower downward, it will be seen that the characteristics essential in machines of this class, practically valuable in the compression of substances, of increasing in pressure as the resistance increases, is secured. When it is necessary to apply more force in using the press than can be conveniently done with the hand-bar, a lever, clearly indicated in the engraving, and suitably connected with the center of the screw by a pawl and ratchet, may be used as the medium for actuating the screw. It should furthermore be mentioned that the moving table or follower is so connected by suitable mechanism with an index finger and scale (not shown in the engraving), that these latter are caused to indicate the pressure exerted by the follower upon the substance undergoing compression, thereby affording an indication of any approach to the ultimate limit of strain which the apparatus is intended to bear.

AN IMPROVED PRESS FOR WINE, CIDER, ETC.

The Sacramento Sugar Beet Experiment.

There appears to have been several trials or tests of the beet sugar-making machinery at Sacramento, the results of which appear to be somewhat mixed. The first was reported as a success, but some doubts being expressed, M. Gramont, the superintendent, was invited to give a new test in the presence of certain witnesses, which he refused on account of some objection to the witnesses. He however, claims to have made a test on the day following, in the presence of unobjectionable witnesses, which is pronounced a success.

It is to be regretted that such personal differences should be allowed to interfere

in a matter of so much public interest. The question, however, appears to be one having sole reference to the skill and capability of certain persons, and not to the general practicability of making beet sugar.

All persons seem to agree that sugar can be made from the beets, and with the machinery now in hand.

In the course of the experiments and tests of the beet in Sacramento a singular anomaly seems to have been developed, according to Mr. Gramont's report, whereby California beets, instead of retaining permanently the saccharine value developed at the period of ripening, lose a portion of that principle by a second growth, which appears to set in at that time, if the beets are not removed from the ground. Hence the view is expressed that the beets must be taken up before this second growth commences; the loss being so great as to render the late pulled roots unprofitable for manufacture.

Messrs. Bonestel and Otto, of Alvarado, however, aver that they have met with no such experience in the beets grown by them; so that in this, also, we must await further developments to learn the truth, or prove whether the fact, if it be one, is a local or general peculiarity. We hope soon to be able to report more satisfactory results of these interesting and important experiments now in progress for producing beet sugar in California.

AN ENGLISH FARMER recently remarked that “he fed his land before it was hungry, rested it before it was weary and weeded it before it was foul.” Seldom, if ever, was so much agricultural wisdom condensed into a single sentence.

Agricultural Resources of Montana.

The recent developments with regard to the productiveness of the rich agricultural valleys of Montana, have been a matter of no little surprise as well as gratification to all who take an interest in the settlement of the great interior portions of the country. The *Helena Herald* enumerates some of the more prominent valleys, which have thus been opened to settlement as follows:

“Of these valleys, nestling between the ranges of the greatest mountain system of the world, the Gallatin, for richness and fruitfulness of yield, is among the most conspicuous in the Territory. In addition we boast the Frickley Pear, the Missoula, the Bitter Root, the Jefferson, the Madison, the Stinking Water, the Beaverhead, the Boulder, the Willow Creek, the Deer Lodge the Crow Creek, and many other valleys, all of them in proportion to their population and development nearly or quite as good as the Gallatin.”

We have already made frequent mention of the wonderful productions of some of these valleys, and there is no longer any doubt but that this region will produce good crops of grain, and all the hardier vegetables. With settlement and years, there will come to every section of this interior Territory a degree of prosperity and thrift second to no territory in the Great West.

The rapid development of the mines in that region is opening a large home market for farm produce, with good prices. Crops of 4,700 bushels of wheat and 1000 bushels of oats and barley are referred to by the local papers.

POTATOES ON THE SUMMIT.—The editor of the *Sacramento Bee* has been presented with a very large Irish potato which was raised on the flat near the Soda Springs, at an elevation 7,000 feet above the sea level. If such localities will produce potatoes like that, what will they not yield? The question is beginning to be asked, says the *Grass Valley Union* in noticing this item, not what land in California is good for cultivation, but what acre, at any altitude is not fit for agricultural purposes.

IRELAND sends large quantities of butter to England, which averages about thirty-five cents per pound.

CALIFORNIA FARMERS are beginning to learn that they want grass more than wheat, or wine, or silk, or gold.

Household Reading.

Maize or Indian Corn.

Maize or Indian corn is generally supposed to be a native of America, from the fact that it was here observed in its present state of perfection, by the early European settlers of this continent. But there is good authority for supposing that a perfect grain of the kind was cultivated by the ancient Egyptians. It is claimed that seeds taken from a mummy have been planted, which have grown and produced a grain something similar to the manner in which the seed of broom corn is grown, from which, or from some similar variety, it is supposed our Indian corn has been derived. Whether the particular variety now known as Indian corn may or may not be exclusively a native of this continent, there can be no doubt, but that like wheat, all the different kinds of this cereal, including Sorghum, etc., were originally derived from different varieties of grass. Both chemical analysis, and practical experience teaches that corn is rich in the elements which nourish the animal system; but as it contains less muscle-making material, and more of that which produces fat, than does wheat, it is more largely employed for fattening swine and cattle than for human food. In order more completely to comprehend the difference, in this respect, between wheat and corn, we append an analysis of its component parts for comparison with a similar table for wheat, which we gave last week:

Water.....14	Water.....14
Gluten.....12	Muscle-making.....12
Starch.....60	
Sugar and Gum.....3	
Oil.....7	or Heat and Fat.....73
Fibre.....3	Food for brains.....1
Mineral Matter.....1	
100	100

By comparing the above with the wheat table it will be observed that the important difference consists in the excess of oil and lack of sugar. The oil contained in wheat was not set down separately in our table last week, but amounts to only 1.2 per cent. while, in northern corn it amounts to 7.

The oily part of corn exerts a most important influence in the use of this grain as food. Oil is a great producer of heat, as was observed last week; but if sufficient sugar and starch be present, they will supply the heat, while the oil will be taken up by the system, and deposited, with very little change, as fat. This is one important reason why corn is so valuable for fattening animals.

We last week referred to the necessity of oil as an ingredient of food in cold climates. Nature most remarkably recognizes this fact, not only providing fat seals in great abundance in high latitudes; but also in depositing a superabundance of oil in the corn grown in such regions. Corn grown in Canada will contain about twice as much oil as can be found in corn grown in Georgia. Northern corn also contains more of the fat producing elements than Southern. For extreme see figures 1 and 2, and compare the shading with explanations given last week. In the accompanying figure No. 1 represents Tuscarora corn (a northern variety); No. 2 another variety of northern corn; No. 3, sweet corn and No. 4 common Southern corn.

Corn as Human Food.

While corn is full of nutrition, and peculiarly adapted for fattening animals, by reason of the oil of which we have spoken, that very ingredient seems to unfit it, to a great extent, for human food, and it should not be eaten until that portion of the grain

is expelled—which can be readily done by heat.

The oil is contained chiefly in the white, flinty portion of the kernel, and consequently is nearly all found in the meal. When thoroughly cooked much of it is expelled, and the whole is expelled by kiln-drying. Corn meal and hominy, after being kiln-dried, and properly cooked may be eaten almost as freely as flour. If eaten before the oil is expelled the process of digestion is weakening to the system. The early Indians and those now existing, who cultivate corn, recognized this fact, even before the whites went among them. Whenever they started upon long marches they took parched instead of raw corn; although the latter is much the most bulky.

Hulled Corn.

In the process of hulling corn, the oil is removed by the alkali employed, while all the other elements, except those contained in the hull, remains intact. Hence hulled corn, well washed from the alkali is a very healthful and nutritious food. The only objection being that a portion of the brain and muscle food is taken away with the hull.

We give, in the accompanying figure correct sectional representations of four varieties of corn, by studying which, in connection with previous explanations, it will be seen that the Tuscarora, a northern corn, (Fig. 1) is largely made up of elements very superior for fattening animals, and that northern corn, generally, is preferable to southern for that purpose. The kernels represented by Figs. 2, 3 and 4, contain a much larger proportion of muscle-making material, and are consequently more especially adapted as food for laboring men, and persons of sedentary and literary employment.

Apples as Food.

The importance of apples as a food: says Leibig, has not hitherto, been sufficiently estimated or understood. Besides contributing a large proportion of sugar, mucilage, and other nutritive compounds in the form of food, they contain such a fine combination of vegetable acids, extractive substances and aromatic principles as to act powerfully in the capacity of refrigerants, tonics and antiseptics; and when freely used at the season of ripeness, by rural laborers and others, they greatly maintain and strengthen the power of productive labor.

APPLES AS MEDICINE.—If eaten frequently at breakfast, with coarse bread and butter, without meat or flesh, apples have an admirable effect on the system, often removing constipation, correcting acidities, and cooling off febrile conditions more effectually than the most approved medicines. The same author as above quoted says they prevent debility, strengthen digestion, correct the putrefactive tendencies of nitrogenous food, avert scurvy, and strengthen the power of productive labor.

WHAT IS A FLOWER.—Flowers are merely leaves, so arranged as to protect the vital organs within them, and colored so as to attract insects to scatter the fertilizing pollen, and to reflect and absorb the light and heat of the sun for ripening the seed.

We see the whole gradual process of the change of the common leaf in all the parts of a flower, most beautifully displayed in the flower of the common white pond lily. The outermost circle of petals is greenish, approaching the herbaceous texture and color of the calyx; the next circles are purer and more succulent, and the inner most ones are snowy-white, entirely cellular, and begin to show rudiments of an anther at their points. Gradually the petals become smaller and narrower, while the anthers on their summits become more distinct, until at length the thread like filaments, and golden dusty anthers of perfect stamens appear in the heart of the flower.

COMMON AND BITING FLIES.—Common house flies invariably stand with the head downward, while biting flies and mosquitoes rest with the head upward.

THE CURVATURE OF THE EARTH amounts to seven inches per mile. A man six feet high cannot be seen from a distance of ten miles.

Mechanical Items.

TEMPERING TOOLS.—The steel is generally first hardened by heating it to a cherry red, and then plunging it into cold water. Afterward the temper is drawn by moderately heating the steel again. Different degrees of hardness are required for different purposes, as follows:

Very pale straw color, 430 deg., for razors and surgical instruments.

Darker straw yellow, 470 deg., for pen-knives.

Still darker yellow, 490 deg., chisel for cutting iron.

Brown yellow, 500 deg., axes and plane-irons.

Yellow, slightly tinged with purple, 520 deg., table-knives and watch-springs.—*Eng. and Min. Jour.*

A WHITESMITH.—What is a "Whitesmith?" asked a gentleman the other day as he read upon a sign "J. Donohugh, Black and White Smith." Webster answers the question thus: One who works on tinned or white iron, or who finishes or polishes iron work, in distinction from one who forges it." The word may be new to some of our readers.

DAMASCUS BLADES, ETC.—The manufactures of Turkey are on a rapid decline. The steel manufactures, for which Damascus has been so famous no longer exist. The muslin looms of Scutari and Tirnova, which numbered thousands in 1812, are now reduced to less than two hundred spindles; and Bronea and Diabekir, once famous for their velvets, do not now produce one-tenth the amount they did forty years ago.

A STONE MIRROR.—In a village in Derbyshire, England, there is a large slab of black marble, the produce of the vicinity, which has so fine a polish, it is by many mistaken for a looking-glass.

LAKE SUPERIOR ORE.—One-fifth of all the iron produced in the United States is made from Lake Superior ore.

INCOMBUSTIBLE WICKS for kerosene lamps are made of asbestos, boiled in wax. When otherwise made of that material they do not work well.

Household Receipts.

GINGER SNAPS.—Take a tea-cup, put in three table-spoonfuls of hot water, the same of melted lard, and fill up one cup with good molasses; to three cups of the mixture add one table-spoonful of ginger, and one heaping tea-spoonful of soda, mix pretty stiff, roll and cut as for cookies (but thinner), and bake in a quick oven. After baking, place them in a warm oven, and let them dry until they are brittle.

TO PREPARE INK FOR TRANSFERRING.—If a little sugar be added to the ink, a copy of the writing may be easily taken off by laying a sheet of unsized paper, dampened with a sponge on the written paper, and passing over it a flat-iron moderately heated. A knowledge of this fact may be useful when a person wishes to occasionally retain a copy of a letter or other writing and is not in possession of a copying press. Common copying ink is prepared by mixing a kind of gum with ordinary ink, and does not need the aid of warmth to transfer it.

CALIFORNIA CAKE.—Seven ounces of sugar, four ounces butter, and yolks of three eggs, three teaspoonfuls milk, half a teaspoonful soda, one teaspoonful lemon, six ounces flour, a teaspoonful cream tartar; and the white of three eggs beaten.

HICKORYNUT JUMBLES.—One coffee cup of chopped meats, one cup of sugar, two eggs, four tablespoons of flour.

TO TAKE INK STAINS OUT OF MAHOGANY.—Put a few drops of spirits of nitre in a tea-spoonful of water, touch the spot with a feather dipped in the mixture, and on the ink disappearing, rub it over immediately with a rag wet in cold water, or there will be a white mark, which will not be easily effaced.

TO TAKE INK OUT OF PAPER AND STAINS OUT OF SILK, ETC.—Mix well the following ingredients: One tea-spoonful of burnt alum, quarter of an ounce salts of lemon, quarter of an ounce oxalic acid, in a bottle, with half a pint of spring water. Wet a piece of soft calico and apply it to the spots.

TO WATERPROOF PAPER.—To waterproof paper, dissolve one pound of white soap in one quart of water. In another quart of water dissolve one ounce of gum nitric, and six ounces of glue; mix the two solutions, heat them, and soak the paper in the liquid, then hang it up to dry.

PAPER sometimes will not stick to an old wall. Where there is danger of this use vinegar in the paste instead of water.

Life Thoughts.

OPPORTUNITIES are like flowers that fade at night; seize them, therefore, while they last.

PATIENCE is always crowned with success. It may not be splendid success, but patience never takes anything in hand that it does not succeed with in some form or other.

WHATEVER else you borrow never borrow trouble. It never does any good, and when you return it you get no thanks.

GOOD-NATURE is a glow-worm, that sheds light even in the dirtiest places.

TRUE RELIGION.—Lamps do not talk, they simply shine. A lighthouse sounds no drum, it heats no gong, and yet far over the waters its friendly spark is seen by the mariner. So should it be with religion, which should be proclaimed and made known by its quiet works rather than by loud or frequent protestations.

AVOID EVEN THE APPEARANCE OF EVIL.—The Chinese have a proverb which says: "Do not stop in a cucumber field to tie thy shoe." The meaning is plain. Some one will be likely to fancy that you are stealing fruit. Always remember the injunction, "Abstain from all appearance of evil."

DO GOOD NOW.—He who waits to do a great deal of good at once will never do any.

SENSIBLE.—Have the courage to wear your old garments till you can pay for new ones.

THE easiest labor is a burden to him who has no motive for performing it.

THERE is no vice that does so cover a man with shame as to be found false and perfidious.

THE manners which are neglected as small things are often those which decide men for or against us.

The Secret of Success.

Take an earnest hold of life, capacitated for and destined to a high and noble purpose. Study closely the mind's bent for labor or a profession. Adopt it early and pursue it steadily, never looking back to the turning furrow, but forward to the ground that ever remains to be broken. Means and ways are abundant to every man's success, if will and actions are rightly adapted to them. Our rich men and our great men have carved their path to fortune, and by this internal principle—a principle that can not fail to reward him who resolutely pursues it. To sigh or repine over the lack of inheritance is unmanly. Every man should strive to be creator instead of inheritor. He should bequeath instead of borrow. He should be conscious of the power in him, and fight his own battles with his own lance. He should feel that it is better to earn a crust than to inherit coffers of gold. When once this spirit of self-reliance is learned, every man will discover within himself the elements and capacities of wealth. He will be rich, inestimably rich in self-resources, and can lift his head proudly to meet the noblest among them.

LIFE.—If we could only read each other's hearts, we should be kinder to each other. If we knew the woes and bitterness and physical annoyances of our neighbors, we should make allowances for them which we do not now. We go about masked, uttering stereotyped sentiments, hiding our heart-pangs and our headaches as carefully as we can; and yet we wonder that others do not discover them by intuition. We cover our best feelings from the light, we do not so conceal our resentments and our dislikes, of which we are prone to be proud. Life is a masquerade at which few unmask, even to their dearest friends. And though there is need of much masking, would to Heaven we dared show our real faces from birth to death, for then some few at least would truly love each other.

DIFFERENCE IN WANTS.—Mr. Peabody was a great discernor of human nature; and few have lived who were better informed as to the necessities of the masses, or who could determine better the manner in which to relieve them. His discernment was most ably displayed in the diverse manner of the disposition of his noble charities, in the two countries where they were bestowed. In England he gave his wealth to furnish fresh air, bread, and cheap homes to the poor. In America he gave to feed the hungry mind. Most of his donations in this country were for the cause of education. This diverse disposition of his charities, affords a most striking exhibition of the peculiar wants of the masses in the two countries.

Notices to Correspondents.

E. PIQUE.—Communication received and will be published next week.
BULL RUN.—We are compelled to defer this letter until our next issue.

Lectures Before the Mechanic Arts College in San Francisco.

The Regents of the University have shown good practical common sense in some of its acts, and a move of the greatest importance to the young men of the city of San Francisco is going forward and will be inaugurated we understand, Sunday evening November 12th.

A series or course of lectures before the Mechanic Arts College of the State University will be delivered at the lecture room of the Mechanics, Institute, Post street, every Saturday evening, and will consist of about five lectures, by each Professor on subjects relating to the Mechanic's Acts, including the consideration of matters which every mechanic and scientific man should know.

The course will consist of about 40 lectures and will be absolutely free. The conditions of admission will be, as far as we can learn, as follows.

1. Students who enroll for the purpose of attending the complete course.
2. Students who enroll for a partial course.
3. Visitors to each lecture students must be present at roll call and occupy his appointed seat.

Any young man or woman can join this class, and should make application without delay at Mechanics, Institute Library.

We are pleased to see that the Regents have recognised this great need, and although but little notice seems to have been taken of the matter, its value cannot be over-estimated, and we wish particularly to call the attention of the young men to this opportunity offered them.

Those who attend the entire course and pass an examination will receive a certificate. We believe it is also the intention of the Mechanics Institute to elect, such, Honorary members for the term of two years next ensuing the date of the State University Certificate.

We look upon the above as one move in the right direction.

Farming in California.

EDITORS SCIENTIFIC PRESS.—I wish to trouble you with the much discussed question; can inexperienced men make money in agricultural pursuits, supposing such men have the energy to study up the theory and consult the agricultural journals of the day? The "profits of agriculture" have been presented to us from every point of view, but we are none the wiser; we are told that the cost of "putting in" and "gathering" a crop of grain is sixteen dollars per acre, if we hire it done, but nothing is said of the cost if we do it ourselves, and nothing is said of what we might expect to realize.

There are many young men in the cities of this State who have the ambition, application and energy to read up the theory of farming and start ranches for themselves provided they had a reasonable chance of success: expecting the vicissitudes of the inexperienced that every man without experience must encounter.

Therefore, I think answers to the following questions, or a discussion of them, would do much good:—

How much money is absolutely necessary to start in wheat raising?

How much is necessary to start in vine culture?

What profit might we expect on a quarter or half section tract of wheat and what on a vineyard of from twenty to fifty acres?

Of course any man may figure the profits easily; but there are always expenses arising in practice of which there is no account made in the theory, and I should like to see some practical figuring upon these questions, pre-supposing ordinarily favorable circumstances, and wheat to remain at its present price.

A CONSTANT READER.

Our correspondent has furnished us with a series of questions, proper answers to which, would require far more space and time than can be devoted to any one subject in a single issue of the PRESS. Their importance, however, demands a careful consideration, and full and explicit answers; and while we may attempt a brief reply, ourselves, we would especially call upon some one or more of our readers who have had practical experience in such matters, on this coast, to give the queries a thoughtful attention, and furnish us with the result of their deliberations and experience.

There is no question, at the present time, in which the public should take a deeper interest than in the settlement of our unoccupied lands, and the proper development of their vast agricultural resources. To this end, just the information above sought is needed. For the lack of it, hundreds of young men in this and other cities in the State, and not a few with families, are either idling away their time, or doing just enough to keep soul and body together, waiting and hoping for something to turn up, whereby they may better their conditions. What is needed for both themselves and the State is for such information as will justify and induce these people to go out and occupy our waste lands, and produce from our own soil the butter, cheese, eggs, pork, pickles and preserves, dried fruit, tobacco, silk, cotton, flax, oils, wines and other liquors, sugar, etc., etc., for which we are now annually sending millions of dollars to the East. We also need their labor to increase our productions for export—such as wheat, wool, leather, etc., which would add many other millions to our aggregate wealth.

Let us have the information, in a reliable and intelligible shape, which may induce our enterprising young men, with little or no means, to start out and do something for themselves and for the State; and also that which shall hold out the same encouragement to men of capital, to go and do likewise. We all have a vague conception that such things are possible, and, in fact comparatively easy of accomplishment; but exactly how it is done, is "the which" not fully understood, and the very information needed as a condition precedent to the venture.

It is within the knowledge of every "constant reader" of the PRESS in California, that men have here accumulated comfortable

fortunes, by cultivating the soil. In some instances this has been done by acquiring cheap lands and improving them, in others by cultivating improved lands for which large prices or high rents have been paid. Thus we have passed the bounds of theory, and arrived at facts, patent and illustrated on every hand. There are innumerable evidences of this in every direction about San Francisco, and in all our interior agricultural counties.

Although such instances of success have generally been confined to experienced men, it by no means follows that "inexperienced men" may not also succeed, especially when such men have a heart to work, and set about it with a resolute determination to achieve success. Farming, like mining, involves hard work and much of it; but the chances of reasonable success are infinitely in favor of the latter, although the large prizes may be less in number. We will endeavor, in future numbers, to give, so far as we are able, definite answers to the several queries propounded by our correspondent; together with some general views on the subject of farming in California, which may possibly be of interest and advantage, both to those already engaged in this business, and to such as are proposing to embark therein. In the mean time we hope also to hear from some of our practical men on the subject.

The Blue Point Tunnel.

In connection with the article by our correspondent, L. P. Mc., on the Blue Point Co. tunnel at Smartsville, we here

GROUND PLAN OF DRIFTS.

give a diagram of the drifts where the 2,000 kegs of powder are to be exploded. For this we are indebted to the courtesy of the tunnel company. The height of the bank from the tunnel is 70 feet, and the main drift will be tampered from the tunnel to the first cross drift. Other very interesting particulars of this work will be found in our correspondent's article, "Notes of Travel in Yuba County," on the second page. At the end of the main drift, at the place marked by a circle, is where the tunnel terminates.

Plow Clevis.—We shall illustrate next week a valuable California invention. This is a patent Plow Clevis, invented and manufactured by Mr. J. A. Bilz, of Pleasanton, Alameda county. Quite a number are in use at Pleasanton and vicinity, where they have had a fair trial and have met with great success. They are as cheap as, or cheaper than, other kinds of drop clevis, and are recommended particularly where young horses are used, as they are arranged so that the whiff-tree cannot strike the animals' heels and thus start them. They are also sold by Treadwell & Co., at San Francisco and Sacramento.

Patents and Inventions.

A Full List of Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING OCTOBER 25th.

FLASK FOR CASTING STAMP SHOES FOR CRUSHING-MILLS.—Henry Bolthoff, Central City, Colorado Territory.

STAMP BATTERY.—George D. Crocker, Virginia City, Nevada.

ORE PULVERIZER.—Frederick C. Morse, Buckskin, Colorado Territory.

HYDRAULIC MINING APPARATUS.—Thomas Watson, Nevada City, Cal.

REFINING SUGAR BY STEAM.—Francis Schleifer, San Francisco, Cal.

NEEDLE.—Hannah G. Supple San Francisco, Cal. Antedated Oct. 15, 1870.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

A NEW BIDDLE.—The Grass Valley Union, which is generally pretty careful and trustworthy on such points, speaks thus of the Rawlins and Stephens biddle:

One has been used at the Wisconsin mill, near Grass Valley, for several months, and has given the most entire satisfaction. We yesterday saw a large machine at work, below the Banner mine, near Nevada City. The concentrator at the latter mine is a wheel 20 feet in diameter, with a distributing table of 12 feet. The traveling table is 4 feet wide. This is working on sand which has gone through several concentrating processes. It is at work below two Paine & Stephens biddles, four rockers and three hundred feet of snices. After all these have taken the whole amount of the sulphurets from the sand which they can save, the sand is run on a Rawlins & Stephens machine. Of course the sulphurets in this sand are light, with only a small percentage of the heavy article which escapes from such complete working. The result is that the Rawlins & Stephens concentrator saves about four or five tone of sulphurets per month, at the Banner mine, from sand which was supposed before to be completely worked. The sulphurets thus saved are worth \$60 per ton gross, at the chlorination works. The expense of running the machine is \$2.50 per day, or \$60 per month. This expense can be further reduced, as a smart boy can attend the machine. We have, then, these figures a "proof of the pudding," in the case of the machine at the Banner mine. From four tons of sulphurets saved at \$60 per ton, gives \$240; deduct \$60 for labor and \$80 for working the sulphurets by chlorination, total expense, \$140. This gives \$100 per month on a machine which cost, in the first place, say \$500. It has been demonstrated that no machine now known can go below the Rawlins & Stephens machine and make anything. Where the R. & S. concentrator works just as the tailings come from the mill, as is the case at the Wisconsin mill, it saves almost all the sulphurets, light as well as heavy. It allows very little metal bearing slime to escape. At the Banner mine, before the new machine was put up, at the sand pile where it is now used, a company had a percussion table 4 feet wide and 18 feet long, two revolving cylinders, one to grind the sand and the other to amalgamate. The arrangement was run by a 20-foot water wheel. The company using these implements lost about \$1,500. Stephens is making money where others have lost. We give these particulars because we know the machine of which we speak is of a meritorious invention. It has been so declared by practical men who have examined it, and orders for its erection, at various mines in California and Nevada, have been sent to its proprietors.

A CALIFORNIA PATENT SECURED IN 13 DAYS.—We received word on Monday last that the application of Albert G. Walton, of this city, for a patent for an improved apparatus for holding and exhibiting cards, photographs and stereoscopic views, was granted at Washington on the 25th of Oct., his application having left our office October 12th. The facilities of the SCIENTIFIC PRESS office for obtaining U. S. or Foreign Patents for PACIFIC STATES INVENTORS, are unapproachable by any other agency in the United States.

Mining in Victoria, Australia.

The Mining Record for March published a summary of the mining industry of the Colony of Victoria for 1869, with statistics from the annual report of the Secretary of mines compiled from the Surveyors and Registers reports.

The statistics show a decrease in the number of hands employed and in the product of gold from Alluvial mining, and an increase in the number employed and in the product of gold from Quartz mining.

The total number of hands employed in mining, both progressive and productive including Europeans, men and boys, and Chinamen, for the quarter ending Dec 31, 1869, was 63,787 against 64,658 for the same time in 1868—a decrease of 871; while there was an increase of 475 Chinamen, making the decrease of Europeans 1,346. About one-fourth, say 16,000, were employed in quartz mining, and about 16,000 Chinamen, nearly all of whom were employed in shallow alluvial mining; the remaining Europeans in alluvial.

During the year, alluvial mining lost 3,376 miners while quartz mining gained 2,503. The scarcity of water consequent upon drought interfered with both alluvial and quartz mining, while the increased facilities to obtain crown lands, caused many to abandon mining for farming.

THE PRODUCT OF GOLD.

Alluvial 1868.....	1,087,502 oz
" 1869.....	934,082 oz
Decrease.....	153,420 oz
Quartz 1868.....	597,416 oz
" 1869.....	610,674 oz
Increase.....	13,258 oz
Total decrease.....	140,162 oz
Official value of gold, £4. = \$20 per oz.	
Total Product for the year, \$30,895,120	

The average yield obtained from quartz being about \$10.50 a ton, the product shows that nearly 1,200,000 tons were crushed during the year 1869, against 886,228 tons for 1868, an increase of upwards of 35 per cent. in one year.

During the year, 230 distinct reefs were proved to be gold bearing,—making a total proved of 2,881.

The official returns for the quarter ending March 31, 1870, show a decrease of 1,581 miners compared with the quarter preceeding; also a falling off in the yield from both alluvial and quartz mining compared with the same quarter. But compared with the corresponding quarter of 1869, there was a gain of nearly 4,000 oz. from quartz; while 30 new reefs were added to those previously proved to be gold bearing.

The prosperity attending mining operations for several years led to a departure from the prudent course which had produced it, to one of wild speculation, stock gambling &c., to be followed as usual by loss, want of confidence, and discredit without discrimination, added to which a number of deep alluvial mines in Ballarat which had produced thousands of oz. per month each, ceased to afford dividends, increasing the depression and causing a panic. New and rich developments recently made in the same and other districts are gradually restoring confidence.

The depression led to the formation of a great number of *tribute* companies, composed of *non working* and working members, to work mines upon shares of gross or net product. Besides which, meetings were held to take into consideration the depressed condition of mining with the object to provide a remedy. Among others,

The Chamber of Commerce of Ballarat

"Having taken up the subject of the present mining depression," appointed a committee to investigate matters. The result was two propositions;—one by Mr. L. S. Christie met with so much favor that immediate steps were taken to carry it into effect.

Mr. Christie proposed to establish a company with a capital of £500,000, to be divided into 100,000 shares of £5 each, of

which 10,000 were to be capital or money shares for immediate issue, payable on application, 90,000 to be reserved for labor. The money shares to be free from all further liability, and to bear interest at the rate of 10 per cent. per annum. Labor shares to be constituted from time to time, in ratio to the amount of wages retained by the association from the workmen over and above the subsist-money they may draw. These shares will be entitled to participate in the profits. The objects of the proposed association are:—To undertake the working of mines upon tribute; To supply preliminary capital and subsist-money to parties of working miners, for want of which they would be unable to undertake extensive and promising tribute ventures; to enable the working miner to obtain a proprietary interest in the venture in which he may be employed; and to cause active operations to be resumed at any promising mine that may have been suspended from the want of capital. No work will be undertaken unless it can be shown to the

THE "FIELDS" IMPROVED BOILER CONSTRUCTION.

satisfaction of the directors that the ground is capable of yielding sufficient to pay the subsist-money of the miners employed.

The tribute system is growing rapidly in favor. Under the system a number of ventures which had involved the companies in debt have become dividend paying. Dozens of companies have been formed, some incorporated under "limited liability." The shares of many of them are quoted above par. Besides "tribute," "Furnishing companies" have been established. The object is to furnish machinery and material to parties of miners working on tribute or where means are too limited to enable them to secure the needed supplies.

From the above data it will be perceived that, as the alluvial mines become exhausted, increased attention is directed to quartz, which the Victorians recognize as the staple interest of the Colony;—the great business of the country, which, to be successful, must be conducted in a business manner, and above all must be fostered; that the interest of the capitalist, the banker, the mechanic, manufacturer and the miner are identical. Hence a *Chamber of Commerce* convenes to take into consideration the depressed condition of mining, with the view to discover the cause and to provide a remedy. M.

THE NEW WAGON ROAD to Bolinas, via Sancelito, is finished, and two stages run, on alternate days, connecting with the Sancelito ferry, and one extending through to Olema.

The "Field" Boiler.

We herewith present illustrations of the "Field" boiler, now well known, and said to have given most excellent results in England, where it has been extensively adopted, and in France, where it is now introduced by French engineers. Our engraving is taken from *La Propagation Industrielle*, which recently published a description of the apparatus. It is claimed for this steam generator that in it are secured the essential advantages of economy of fuel in the production of steam and the concentration of a large heating surface in a comparatively small space, with the attendant benefits of a minute division of the masses of water and the rapid generation of steam. The former results from the special arrangement of the parts, by which more completely than hitherto the heat radiated from the fire is utilized. The principle may be applied to all varieties of the upright class of steam generators. In the engravings, Fig. 1 is a vertical transverse section of the boiler, and Fig. 2 a similar section, on a greatly enlarged scale, of one of the adjuncts which give to the apparatus its distinctive character.

The crown-sheet above the fire is pierced

secured—the degree of the transmission being proportionate to the difference in temperature between the outer or heated tubes and the inner ones. It may also be noted that the perfect combustion of inflammable gases from the fire is facilitated by their division when brought in contact with the downwardly extending tubes, and their consequent more thorough intermingling with the air supplied for combustion.—*Am. Artisan*.

A COLORADO TRAMWAY.—The Colorado Miner gives a description of a wire tramway in use at the Stevens mine at Georgetown. This consists of two wire cables, each of which is six-tenths of an inch in diameter, extending from the lower adit on the Stevens lode to the base of the hill, a distance of 867 feet. The supports for the wires are made of gas pipe, three inches in diameter, upon the top of which are wrought iron T's, securely let into the gas pipe, upon the top of which T's the wire rope rests. The gas pipe is set into the rock to the depth of twenty-two inches, and is securely fastened by a solder. The distance from the lower platform to the first support is six hundred feet, the cables resting on their supports with a firmness remarkable for such a long stretch of unsupported rope. For fastening the cables at the base of the hill, there are two levers, one end of which is securely bolted to the solid foundation, yet in such a manner as to allow an upward and downward motion of the lever. These receive the ends of cables, which are fastened to the levers near the bolted end, the outer ends of the levers being weighted with rock. This contrivance takes up all loose cable as the ropes may slacken or be taut by the passage of a heavy load of ore over them. The tramway works to perfection. Already there have been seven thousand feet of lumber taken up the cables, and thirty tons of ore lowered to the base of the mountain, demonstrating that the method employed by Mr. Lowe in erecting this tramway to be a successful one.

NEWSPAPERS.—According to L. P. Fishers Advertisers Guide (just received) there are 255 newspapers published on the Pacific Coast. This number is probably very nearly correct, although in the list we miss the names of one or two exchanges which have been started within a short time. The count gives 184 to California, 26 to Oregon, 12 to Nevada, 12 to Washington Ter., 5 to Utah, 5 each to Idaho and Montana 2 to Arizona, 1 to Alaska and 2 to British Columbia. San Francisco is credited with 63. Every county of California is represented except Del Norte. In addition to the names of papers, a short description of each place is given where a paper is published. This makes the pamphlet interesting and valuable, especially to advertisers and business men, and gives a tolerably correct picture of the coast.

THE GOLD FIELDS of Victoria, Australia, are becoming famous for the heavy character of their gold. In two years (apart from many smaller nuggets, of which no note has been made), there have been unearthed from one mining district, two nuggets weighing 15 lbs. each, one of 17 lbs., one of 19 lbs., four of 20 lbs. each, one of 22 lbs., one of 24 lbs., one of 27 lbs., two of 40 lbs. each, one of 43 lbs., one of 50 lbs., one of 67 lbs., and now one of 93 lbs. These statements are officially verified.—*Ec.*

WELL BORING.—On Thursday last, says the Council Bluffs *Nonpareil*, with a gentle mixture of fact and fancy, the labors of the parties who had been boring for the last eighteen months in Lincoln, the capital city of Nebraska, for salt water, were crowned with success. At the depth of six hundred feet below the surface, in a stratum of sandstone, a lead of the great subterranean sea of salt water was struck, and the briny torrent came struggling up around the auger and shot into the air some eight or ten feet. It has since flowed steadily and strongly, and with great force and increasing strength, forming a briny rivulet. It is believed by the experts who have seen the flow, that when the auger is withdrawn and tubing inserted, a stream of water will be projected from the well to the height of fifty feet, making it the most magnificent artesian well of salt water in the world.

It is stated that the paper mills near Santa Cruz are for sale.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

The California Powder Works

No. 311 CALIFORNIA STREET,
SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING, 1

MINING,

And BLASTING

POWDER,

FOR SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported
into the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market. 25v
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AG-
RICULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives
now in use, and the lifting force of the best blasting
powder, thus making it vastly superior to any other
compound now in use.A circular containing a full description of this Powder
can be obtained on application to our Office.

15v21-3mNEVER NAUSEATEA WEAR STOMACH.—The condition of
a weak stomach was never yet improved by cathartic
drugs. They merely increase the irritation, which it is
all-important to allay. There is no preparation in ex-
istence which so quickly and certainly relieves nausea
as TARRANT'S EFFERVESCENT SELTZER APERIENT. Its im-
mediate effect is to soothe and refresh the uneasy organ.
It arrests vomiting, or the disposition to vomit, at
once, and carries off without pain, through the in-
testines, the morbid excreted matter which is the provoca-
tion of nausea. A dose of the Aperient will always ef-
fectually "settle the stomach" after a night's dissipa-
tion.

Reading for the Hour.

Tobacco and Scientific Men.

Tobacco occupied quite a large share of the attention of the learned men of England, who are devoted to the advancement of science, at their last meeting. No very satisfactory conclusion was arrived at, however, but our readers can form their own opinions as to which had the better side. In the discussion,

Mr. Wilkinson read a paper containing an eloquent protest against tobacco, the use of which, he contended, was an abuse. He had never met with a smoker or a snuffer who would recommend the habit to the adoption of any one else. He recommended ladies to take up the question. They at least had the power to refuse an offer of marriage (laughter), and he recommended bachelors to make a note of the fact.

Mr. Hurst was much disposed to question whether tobacco shortened life; he rather thought that it lengthened it in many cases. It had a one great effect—it seemed to compose the mind in a wonderful manner. He knew several eminent clergymen who smoked, and who attributed their good sermons to the habit. (Laughter.) The use of tobacco also gave employment to a large number of persons.

If there was any one truth of which Dr. Stewart, as a medical man, was convinced, that truth was that tobacco was injurious to both health and morals.

This was just the case with Dr. Willows, who regarded Mr. Hurst's arguments as entirely fallacious. Under medical watching, tobacco might be a good and useful agent, [and certainly it would be a good thing for doctors if smokers took medical advice with each cigar or pipe,] but he believed its general use to be injurious.

Mr. R. Dawharn [euphonious for barn door?] defended the moderate use of tobacco, and then threw the whole force of the argument against it on those who used it immoderately. Mr. Botly threw the argument back with vigor, standing on the ground of health and economy.

The meeting then agreed to leave the settlement of the affair to Prof. Huxley. [The probable way in which the two sides came to agree on this, is to be found in the fact that the anti-tobacco men knew that he *had* hated its use, and the others knew that he *did* like it.] The Professor unwillingly stated that he was placed in an awkward position. After finding tobacco a deadly poison for 40 years, one rainy day and a hard walk had showed him that his previous ideas were mistaken ones. As an equalizer of the temper, he regarded it as a most beneficial agent, and in moderation as unproductive of any evil results. A man might poison himself with green tea or beefsteak, if he took them in excess, but they were nevertheless beneficial when moderately used.

Mr. Wilkinson said that Prof. H. would have been a better man if he had remained in his normal state and never used tobacco. He—

But the Rev. John Jones, fearful that the scientific gentlemen were getting unduly excited, here changed the subject to that of "Intemperance in Liverpool."

How OYSTERS ARE BORN.—Open an oyster, retain the liquid in the lower or deep shell, and, if viewed through a microscope, it will be found to contain multitudes of small oysters, covered with shells and swimming nimbly about—one hundred and twenty of which extend but one inch. Besides these young oysters, the liquor contains a variety of animalculæ and myriads of three distinct species of worms. Sometimes their light resembles a bluish star about the centre of the shell, which will be beautifully luminous in a dark room.—*Exc.*

LIFE is a great poem; and religion, love and music, are its sweetest stanzas.

How We Get the War News.

The press dispatches from Europe to New York during the last four weeks numbered about 100,000 words. New York has been better posted on the issue of the war each day, than London, Paris or Berlin.

Here is a man sitting in a dark room at Heart's Content. The ocean cable terminates here. A line wire attached thereto is made to surround two small cores of soft iron. As the electric wave, produced by a few pieces of copper and zinc, at Valentia, passed through the wire, these cores became magnetic enough to move the slightest object. A looking-glass, half an inch in diameter, is fixed on a bar of iron one-tenth of an inch square and half an inch long. On this tiny glass a lamp is made to glare so that its light is reflected on a tablet on the wall. The language of the cable is denoted by the shifting of this reflected light from side to side. Letter by letter is thus expressed in this fitting idiom, in utter silence, on the wall. There is no record made by the machine except as the patient watcher calls out to a comrade the translated flashes as they come, and which he records. It seems like a miracle of patience. There is something of awe creeps over us, as we see the evidence of a human touch 3,000 miles away swaying that tide of light.

By such a delicate process as this, and after being repeated from line to line five times before its ultimate copy is in New York, have the late great battles been recorded in our daily papers with great particularity, and sent throughout the Union. Nothing like it has ever before been accomplished. The enterprise of the New York press has eclipsed that of the wealthiest and ablest presses in Europe. It is characteristic of the nation to do its work grandly and well.—*Jour. of the Telegraph.*

The Uses of Salt.

Salt not only exerts an important influence upon mankind, but is indispensable to their existence. It enters into the constitution of the blood, which contains 4-1000 of its weight of salt. Its absence from our food would inevitably result in death. It is an important condiment, as well as a preservative. Meat, fish, vegetables, butter and other provisions, are preserved by it from spoiling, so that they may be kept for a long time. By its use in the preservation of meat, the development of navigation has been greatly promoted, and it thus exerts a most beneficial influence upon civilization.

It is necessary to vegetable as well as animal growth, and is therefore employed as a fertilizer. In chemical manufactures considerable quantities are used for the preparation of hydrochloric acid, chlorine, bleaching salts, sal ammoniac, and many other products. Salt forms indirectly a material for the making of soap and glass. Besides, it serves in tanning, for glazing pottery, for the extraction of silver and copper from their ores, for the preparation of mixtures for producing cold, and for many other purposes.

The extent and importance of the uses of salt can scarcely be better described than in the words of Dr. Bolley, which we translate from a work of his, entitled "Das Kochsalz:—

"We awake in the morning; the linen which we put on betrays by its whiteness that it has been bleached by the chlorine derived from salt; the shoe with which we cover our feet required salt in the hands of the tanner; in the soap that we use for the toilet, we seize a transformed piece of salt; the glass, which we bring to the mouth, hides the chief ingredient of salt; from the crude ore by means of salt was produced the bright, white metal of the tea-spoon, which is so highly esteemed by the world; the tea-kettle is soldered with borax which holds soda produced from salt; the milk before us contains salt; the butter has been preserved by it perhaps for months; the bread betrays to the palate that the dough has been mixed with salt. We grasp the paper; it required the application of chlorine from salt in order to please us by its whiteness. The clean spectacles through which we see are partly composed of what once was salt. A visit is announced; a patient wishes to consult us; he enters, and, seeking scientific aid, we reflect upon the remedies at our command and commence to write. Out of ten medicines we find that five of them owe their origin, either by their composition or the mode of their preparation, to salt.

"Who is able to forget for one moment this ever present Protenus that appears in a thousand forms?"—*Technologist.*

The Kuro Siwo.

The Equatorial current of the Pacific is wider and grander even than that of the Atlantic. It is the parent stream, out of which so many other hodies obtain their volume. It moves (so do all such currents of the ocean) on the line of a great circle, and this circle intersects the Equator at an angle of only a few degrees. It sweeps to the westward, in "uninterrupted grandeur," as one expresses it, around three-eighths of the circumference of the globe, until diverted by the continent of Asia and split into innumerable streams by the Polynesian Islands. Reaching the Ladrões, it imparts a much warmer climate than it has given to the Sandwich or Marquesas. The Philippines are made oppressively hot even in Winter, and one familiar with it has said: "The fervor increases as we reach Malacca, is all aglow in India, and becomes stifling in its intensity as these equatorial waters, after traveling fifteen thousand miles, and being fully three hundred days under a vertical sun, are thrown against the eastern shores of Africa." This equatorial current is as broad as the Torrid Zone, and out of it comes the Kuro Siwo.

The latter possesses a temperature more striking in its contrast with the surrounding waters than does the Gulf Stream of the Atlantic.

Striking off at Formosa from the great Equatorial, it moves with majestic powers, heedless of the fiercest gale, and to the eye of the thoughtful observer is bent upon the discharge of some momentous mission. Reaching the fortieth parallel of north latitude, its surface is swept by the "brave west winds" of the Northern Hemisphere. It now seems to turn away from its course, and curve away to the American shores. On the track of the northeasterly flow, the map-maker writes another name, as if some mighty power had diverted it. But it has not been turned; only a little of its foamy surface has been borne along in the easterly set. The vast torrent is only skimmed. The recirculation which pours around the southern coasts of Alaska, and leaves the western shores of Sitka Island, is but drift. The tremendous hulk of equatorial water rushes on in a chargeless course. It is moving in obedience to a steady and almighty hand. Every drop feels the impulse of a force it cannot resist. Every drop is lighter than the drop of polar water, with which it is hasting to exchange places, lest the equilibrium of nature be overthrown.

But on its way it receives, every moment, an impact from the earth rotation. And thus it moves on the line of a great circle to the northeast, and, entering Bebrings Sea, knocks for admission at the very gates of the Polar Ocean. In its course the pathway is strewn with the marks of its thermal and climatic power. If the Gulf Stream has clothed Ireland with its robe of verdure, and made it the "Emerald Isle," the Kuro Siwo has done as much for the Alutian Islands and Alaska. They are mantled with living green. The flocks scarcely need shelter in Winter. If their soil is treeless, their Gulf Stream richly supplies them with timber for their canoes, and camphor-wood of Japan and China for their furnitures.—*Atlantic Monthly.*

Gov. GILPIN, of Colorado, was introduced to the British Association by Mr. Hepworth Dixon. Mr. D. delivered himself of quite an amount of flattering sayings with regard to the Governor, his sagacity in locating Colorado so that it included both sides of the Rocky Mountains, which thus formed "a connecting link, instead of a dividing band," for the peoples on each sides of this mountain chain, etc., etc. Governor Gilpin then made a characteristic address, after which Mr. Dixon had supplementary remarks to make, as might have been expected.

INDIANS AND AGRICULTURE.—On the same day, Mr. J. Heywood read a paper on the aptitude of the North American Indians for agriculture. He took rather a sunny view of the subject, and thought that the Indians managed their farms with intelligence and success, where they had had any to manage. The Indian Department, however, supplied them very badly and showed much ignorance of their requirements. As a sample, a supply of elastic garters was sent to the reservations, which, as the Indians did not wear stockings, were rather

out of place. The Association thought this a good joke, and laughed accordingly. If they had known more about the matter, they might have perceived that, although it might have been a good joke for the contractors, it was rather serious for the Indians and for the people who paid the money therefor. In conclusion, he expressed his belief that there was a large number of red men capable of agricultural work, and his point was that the Government should afford them much more encouragement than at present. Sir Stafford Northcote and others took similar sunny views. These gentlemen would do well to settle for a short period of time in Arizona, and test their theories by practical experience.

A Two-Headed Child.

Ohio claims a curiosity which puts the Siamese Twins entirely in the shade. This curiosity has among other points, the faculty of existing in at least two different localities in the State. Or else there are two two-headed children residing in two places, if we are to believe the newspapers, which we always do. We append one description. It is not necessary to say to which locality this belongs. Our readers can first puzzle out the question of how the child sits down and then, when they have solved this riddle, they will no doubt be easily able to guess anything else necessary for a full understanding of the matter.

"We have a monstrosity a short distance from here that will heat the world. Last Tuesday morning a lady gave birth to a double child. It is of the natural length of a child, with perfect head on each end. On one side there are two perfect legs, with feet; this side, only, is the gender apparent—that of a female. On the other side there is one leg, which is as large as both the others, and appears to be double; the feet displays eight toes. The creature is healthy. It takes its food well in both mouths, and digests well. There is but one set of bowels, and it had but one navel string. *One end will cry at a time!* I think the old women will say: 'Did you ever?'"

A HOLE FILLING A HOLE.—We notice a decidedly novel and original plan adopted in some of the mines along the Comstock ledge, for filling in worked-out chambers where there is not enough waste material to do it with. A short drift of 15 or 20 feet is run into the East clay wall, inclining upward at a sufficient angle, and widening as it advances. In a few hours the firm tough clay begins to slack from exposure to the air and falls from the face of the drift in large flakes and masses, sliding down the incline into the chamber where required. As each mass falls, it leaves a still larger surface exposed to the air, consequently more keeps falling until a continuous stream of loose clay comes sliding down, and keeps doing so until the chamber is filled, when the drift goes on and fills itself up. After that, all there can be is a gradual settling, which may or may not ever reach the surface.—*Gold Hill News.*

PIANOS.—Go through one of the fashionable streets of any of our great cities and listen to the tinkle tinkle of the piano. Go into another street and hear it repeated; try the experiment in another city and you will find it the same. The piano is everywhere, from the cottages of the poor to the palaces of the rich, in city or country, and in native and foreign homes. Three hundred manufacturers in our land are engaged in this branch of business, employing fifty thousand men, and turning out twenty-five thousand instruments per year. Every hotel has from one to a dozen, every boarding school from six to thirty, and there are thousands of places besides where two or three may be found. The sound of the piano in the United States never ceases. Before the last music-hall in San Francisco closes for the evening, the pupils in boarding schools in Maine have caught up the melody and repeat it until midnight. A business that is large enough to supply all these various instruments cannot be small. Large capital is employed, long experience, and the greatest skill.—*Rowell's Directory.*

THE GOLD WIZARD has been traveling about Nevada City with his divining rod of whale-bone with a metallic hob in the center. He has been astonishing some of the miners. If they give him the chance he'll astonish them still more.

PHOTOGRAPHY.—For Cabinet Photographs, of Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 23 and 27 Third Street, San Francisco. Every picture warranted to give satisfaction.

THE GREAT ENIGMA.—A thousand guesses have been made at the ingredients of Sazouo r, the most wholesome and perfect dental purifier the world has ever seen. They were all wrong, so, by way of throwing light on the subject, it is now announced that the LUBER, or inner bark of the QUILLAYA SAPONARIA, the Soap Tree of the Valley of the Andes, is one of the components of that peerless dentifrice.

AGENTS WANTED FOR

Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever published. It is not only a

COMPLETE ENCYCLOPEDIA,
Freshly written, and up with the times, but is also a thorough and complete

Lexicon, a Gazetteer of the World, a Biographical, Biblical, Legal and Medical Dictionary.

And the only book ever published containing all these subjects, with 2,000 Engravings. This really wonderful work is to render readily accessible reliable information on every conceivable subject. No human being could be found to whom it would not prove invaluable. It minutely describes every disease flesh is heir to; explains every legal term or phrase; gives the geography of the entire world; acquaints you with all noted men and women living or dead; describes every country, city and town; defines every word in use in the English language; pictures the birth-place and gives portraits of many distinguished personages; teaches the correct pronunciation of proper names; is a biographical dictionary of all nations; a biblical dictionary; describes every animal known to exist; acquaints you with authors, sculptors, travellers, warriors, painters, divines, historians, naturalists, etc., of ancient and modern times; speaks of all the battles and heroes of the late war; and explores the whole vast vegetable kingdom.

AGENTS WANTED.—Apply to F. DEWEY & CO., 542 California Street, San Francisco, General Agents for the Pacific States, and Territories. 1v21-3m

MILLER & HALEY'S MILLS, BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers.
18v21-3m

MILLER & HALEY,

A Valuable Improvement

Combination Locks,

And Fastenings for Vaults and Safe doors. Invented and Patented by Kirtledge & Leavitt of this city. The improvement of which consists in the applying of a "Detachable Knob" or Wrench to the Arrows or Cylinders, passing through the door, so as to operate the Lock and Fastenings on the inside—leaving the outer end sunk or even with the surface of the door. It is made of hardened steel so as to resist the operations of the Burglar, rendering the Lock perfectly secure and safe.

All parties are hereby cautioned not to infringe on this patent, as the owners will protect their rights to the full extent of the law. None genuine unless marked K & L's Patent. Manufactured and sold by

KIRTLEDGE & LEAVITT, Patentees,

THE MASONIC MIRROR

Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a

QUARTO-MEDIUM SIXTEEN PAGE PAPER
AND IS A FIRST CLASS

Literary and Family Newspaper,
AS WELL AS THE
Organ of the Masonic Fraternity on the Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by the M. W. Grand Lodge, F. A. M. of the State of California, at its Annual Communication, October, 1870. Whereas, in the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,
Resolved, That this Grand Lodge, recognizing in the Masonic Mirror, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, as published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said MASONIC MIRROR to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the Masonic Mirror, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The Mirror presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

San Francisco Metal Market.

NOVELTY MILL AND GRAIN SEPARATOR.

THE undersigned having purchased of the Patents, WILKES & SWIFT, of Hudson, Michigan, their right to this mill, patented June 23d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS and GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dicky Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL. For Durability, Efficiency, AND ECONOMY OF WORKING, HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an ever increasing popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON, San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 327 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

BLAKE'S PATENT STEAM PUMP.

THESE PUMPS.

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

It is POSITIVE UNDER ANY PRESSURE. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility, hauling no Cams, nor complex Rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having NO DEAD POINTS, it therefore needs no watching, and is consequently ready to start without using a starting bar or any 1 and work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Lumberyards,

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that Can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. FORTY DIFFERENT SIZES are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that might be required. For sale by

BERRY & PLACE,

112 and 114 California Street, San Francisco.

Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded.

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the Best Pump on Exhibition.

HOADLEY'S PORTABLE ENGINES!

3 to 20 Horse Power on Carriages and Beds.

These Engines are in use all over the United States, and are regarded as the best in use. They are self-contained Engines, without the running gear and appurtenances, for driving

Saw Mills, Grist Mills, Tanneries, Machine Shops, Planing Mills, Factories &c.,

and for all other purposes under seventy-five horse-power, to which Stationary Engines are applied. For Agricultural uses they are unsurpassed. For Circulars or pamphlets, describing dimensions and price address

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

FOR SALE.

One 10-Stamp Mill With Thirty Horse Power Engine,

Boiler, Hoisting Reel, Eight Inch Cornish Pump, Wire Rope Cars, all complete and as good as new, will be sold at a bargain. Inquire of

THE ASPHALTUM PRESSURE PIPE COMPANY,

HAVING ERECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities,

Are now Prepared to Take Orders! AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street. 16v21-1f

PATENTS BOUGHT AND SOLD ON COMMISSION.
Barnes' Thill Holder.

Dennis Combination Gridiron.

No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application.

A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!

By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest hit is used and the horse's mouth cannot be injured.

No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East.

We invite manufacturers and others, to call at our office and make their own investigations.

WIESTER & CO.,
314 Bush Street, San Francisco.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 23, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPOR ENHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be taken half doses, often repeated; and that one of the Pills of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs; FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread; FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence, FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL MOUNTAIN BALM —AND— OREGON GRAPE, Two Plants, abounding on the base of, and on the Mountains surrounding MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY
R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, Fargo & Co's Express to that office which is nearest to the invalid's residence, and that person will be sure to get it. 3v21-124w

Plow Beam Clevis.

As we announced last week, we hereby give our readers an illustration of an improved construction of a clevis for plow beams, invented by a resident of this State. It is a simple device for regulating the depth at which it is desired to run a plow, and can be readily understood by referring to the cut.

The two arms of the clevis are attached to the end of the plow beam, one arm being placed on the upper, and one on the lower side of the beam, and secured by a screw passing through the beam and similar to that used in the ordinary clevis. The plow is thrown to and from the land in the usual manner by shifting the pin from side to side and placing it in holes prepared for this purpose.

The front ends of the two arms are secured to a metal bar having a slot running longitudinally through it. The arms are slotted behind this so that the second bar, to the bottom of which is attached the link, can slide up and down. The link is secured by a swivel joint to the connecting screw so that it can turn in any direction, and, of course, it rises and drops with the second (sliding) bar. This sliding bar is held at any desired position by a set screw.

The depth at which it is desired to run the plow is regulated by moving the sliding bar up and down. By the use of the swivel joint, the doubletrees, which are secured to the link, are allowed to remain at all times in the proper position. Thus, when it is desired to let the horses stand for a time, the plow is generally thrown over on its side; and when the ordinary clevis is used, the motion turns the double trees and causes the tugs to strike the horses legs, frequently resulting in run-aways. But with this device, when the plow is thus thrown on its side the link turns and allows the doubletrees to remain in their proper position.

A patent was granted for this invention through the SCIENTIFIC PRESS agency, in March, 1869, to Mr. John A. Bilz, of Pleasanton, Alameda county. Mr. Bilz manufactures his clevis and has introduced it quite extensively, and with great success, among the farmers in his section, by whom it is much liked. Messrs. Treadwell & Co., have the agency here and in Sacramento, and our agricultural readers can obtain particulars as to the price, etc., by applying to either of the above named parties.

The Steam Jet Pump.

The illustration annexed shows a pump which comes highly recommended for filling tanks for steam engines and for use in mines, quarries, distilleries, on farms, etc. The use of this pump saves the expense of building and running an engine. It may be put in a well or near a stream of water, a long distance from the boiler, and steam carried to it in a pipe, thereby dispensing with the (otherwise) necessary outlay for putting up costly machinery to work a common pump in such localities.

The illustration shows sufficiently well the device, the details of the important

quires no belts or pulleys or other machinery, operates entirely independently of an engine, and costs but comparatively little. They say that it will not choke up with foul water, will not easily wear out or require repairs, is certain to work at all times, and is not liable to injury from freezing.

Practice has shown that no more than twenty-five pounds of steam are to be used to start the water, and when this is done, about one pound of steam for each foot in height through which the water is raised; also that there should not be a suction lift of more than sixteen feet. This applies to the standard size, illustrated in the cut, which throws from fifteen to twenty gal-

BLAKSLEE AND WILLIAMS' PATENT STEAM JET PUMP.

point of this particular pump being shown in the small sectional figure below the boiler. A boiler is set up encased in masonry, as here shown, or otherwise suitably constructed. From this extends a steam pipe which leads into that part of the machine shown in the section. As the steam rushes up the upper part of the supply and discharge pipe, it creates a vacuum, and the water is drawn up through the pipe and can be carried to any proper point. The cut shows a reservoir, which is taken for the purpose of illustration.

This brief explanation shows the grounds on which the inventors base the advantages claimed, bringing many testimonials of practical working to substantiate their claims. They call attention to the points, that it is operated by steam taken directly from the boiler into the pump, that it has no valve or wearing parts of any kind, re-

lons per minute. Other sizes are made on special order to suit any locality and to throw any desired amount to various heights.

The machine is known as the Blakslee & Williams' Steam Jet Pump, and a patent for it was granted on June 15th, 1869. It is manufactured by Messrs. Parker & Hunt, corner 10th and K streets, Sacramento, for raising water, oils, acids, etc. It is made with great care, and each pump is carefully tested at the factory. The steam suction and discharge pipes are attached to the pump with brass nuts and swivels threaded for gas pipe. The steam port and combining pipes are of brass. For use with acids they are made all brass with soldering swivels. The agent in San Francisco is Chas. F. Brock, at Hooker & Cos., 117 and 119, California street. For further information apply as above.

Mechanic Arts College Lectures.

We referred to this matter in an article last week which was set up in the "wee small hours" of the night, just before going to press, and which consequently did not receive the benefit of being read before going into the paper. But the matter is one of the highest importance, and we would again call attention to it.

It ought to be understood that the course is absolutely free to all. It is held in the hall of the Mechanic's Institute, but has no other connection with that establishment. It comprises a list of subjects, most interesting as well as useful; and we hope that it will be fully attended.

The first lecture is held to-night, when after a short introductory address by one of the Regents of the University, Prof. Joseph LeConte will commence a course on the Geology and the Coal Measures of the Pacific coast. Then Prof. John LeConte will follow with a series of lectures on Industrial Mechanics; Prof. Carr, on Chemistry, and the other Professors on practical subjects connected with their departments. We have been permitted to see a general list of the subjects to be treated, and we see that which promises to come home, in one way or another, to almost every person in our city.

The whole course will consist of about forty lectures. The various laws which are brought to bear on our farms, in our mines, our foundries, our manufactures of all kinds, will be treated of in a manner easy to be understood and of practical application. The lectures will be illustrated by such experiments as will aid the understanding and increase the interest. We hope to be able to give a report of each lecture, that those of our readers who live at a distance may likewise share some of the benefits of this most praiseworthy action of the University.

We would again recommend young men of all professions and trades to attend this course which is liberally offered without cost to them. They need the instruction which they can now receive. Moreover, a full attendance, while benefitting the community, will encourage the Regents to further exertions.

COLORADO MINERALS.—We have just received from the author a very valuable catalogue of the principal minerals of Colorado, with annotations on the local peculiarities of several species, by J. Alden Smith. Mr. Smith has been (and is now, we presume,) connected with the Central City Register, and we had the pleasure last year of seeing his interesting collection of minerals at the Register office. Mr. S. has paid attention to the subject for years, and we expect much pleasure in studying out his pamphlet, which came too late for a critical examination before going to press.

UNHAPPY MEXICO has another revolution, which has broken out in Guerrero, and Michoacan. One in Tehuantepec, it is feared, will cause trouble for the U. S. Canal Expedition.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

All About Montana.

[Written for the Scientific Press.]

Radersburg.

Radersburg, the county seat of Jefferson county, is situated on Crow Creek, some 70 miles from Virginia City and 45 miles from Helena. It is a small place but has in the mines around it and the farming districts of the Crow Creek Valley the elements sufficient for sure growth and prosperity. The creek flows easterly, past the town, and empties into the Missouri River.

To the West of the town there are a large number of quartz ledges, which have an excellent name. In company with Mr. Chas. G. Hallbeck, who treated me throughout with that genuine hospitality and kindness for which our miners are noted, and to whom I here return my hearty thanks, I visited the principal mines within a range of two to four miles from Radersburg. The first was the BLACKER AND KEATING lode, taken up in 1866 by the present owners who commenced with but little money but have taken from their mine large amounts. We went underground with the foreman, Mr. J. Hockin. The Discovery shaft is down some 90 feet and is only 63 feet from the main shaft where the ore is raised. This last is down 100 feet, at which depth the water has stopped further operations below, and they are stopping out the ledge to the surface. The average width of the ledge is two feet; the general character of the ore is a red or yellowish decomposed quartz, rich in free gold; the ledge is almost perpendicular with a hanging wall of slate and a foot wall of granite. The rock is hauled a short distance to the mill and yields from \$30 to \$100, average \$50, per ton. Mr. Blacker owns a 2-stamp mill, driven by an overshot water-wheel; in six weeks run last Fall, with this mill and two small arrastras, they obtained \$7,000. They are now getting from \$300 to \$800 weekly from ore from the Keating and the Leviathan lodes. The company is drifting on the KEATING lode, having worked 160 feet north and 80 feet south. They are making a large horse-whim for raising ore and intend putting up fine hoisting and pumping machinery at no distant day. This is one of the best mines I have seen in the Territory.

Leaving the mine we pass a large number of bars and gulches worked by the placer miner. The first is the claim of Mr. W. QUINN, located in the gulch below the Keating lode, from which it has evidently been fed. Mr. Q. has three ditches, carrying water from Crow Creek, about 12 miles, and furnishing some 1,200 inches. The water is sold over and over again in the ditches. The third or branch ditch cost \$12,000 and was completed last winter.

In Keating Gulch is the KEATING MILL, with 15 stamps, 18-horse power engine, large copper plates in front of the batteries, a small settler, etc. It is run night and day.

Crossing this gulch is the ONTO lode. The mine of this same name is owned by Ohlmann, Keating & Co. They have a shaft 50 feet deep and a tunnel 100 feet long. The ledge will average two feet in width. It was struck in 1866, but only recently have the owners really commenced work on it. A lot of 70 tons run through the mill yielded \$2,100.

The SAMPLE MILL is situated about half a mile above the last named mill, and has a 15-horse power engine, 12 stamps, copper plates, a settler and an arrastra.

The IRON CLAD lode, discovered in 1867, is four miles from the city, and is traceable for several miles. It has been cut up into numerous claims of 150 to 250 feet in length, and on it ten shafts have been sunk, the deepest being down 130 feet. It runs north and south, has an average width of about three feet, and contains rich ore, generally decomposed, holding free gold and (in some places) sulphurets. The Discovery Shaft is down 90 feet; the Sample, 125 feet; and the Nolle, 40 feet. A lot of 17 tons of rock yielded \$62, and one of 70 tons \$28, to the ton.

Other ledges I must speak of briefly. The SPARRINGTON averages 3½ feet in width and has a shaft 65 feet down. The LEVIATHAN has a shaft 170 feet deep and promises very well. The TWILIGHT, three feet wide, has a shaft down 70 feet; water stopped operations at that depth, but I am told that the rock was very fine, and that operations will soon be re-commenced. The LEE has a shaft 60 feet down. A lot of 150 tons yielded \$43 to the ton.

The section is certainly a most promising one. With its quartz ledges, quite a number of which are proved to be very rich, with its valleys, on Crow Creek and the Missouri, affording excellent opportunities for stock raising and farming, with abundance of wood and water, with a genial climate, it is certain to attract labor and capital and to become an important part of the Territory.

W. H. M.

A Trip Among the Mines.

[Written for the Scientific Press.]

On arriving at Marysville, by the Vallejo route, at 2:15 P. M., the passengers bound for Camptownville and Downieville, tarry until 4 A. M., and then take the stage and arrive in Camptownville at 2 P. M. and at Downieville at 8 P. M. At the

Oregon House

They breakfast. One is not struck very forcibly with the appearance of the old hotel but it has the reputation of providing the best table on the road; our party seemed to think so, as we all were infinitely improved in feelings after partaking of the delicious and well cooked spring chickens. It was just the kind of a meal to fortify us against the fatigues of travel for the coming day. This is quite a resort in the summer time for families, and for ladies in delicate health. I do not know who "keeps the hotel" but from their excellent style of cooking, should judge they were New England people. Leaving here, and passing Dobbins Ranch, which will be remembered by many an old "forty-miner," as a then Way station, we arrived at

Camptownville.

The Downieville passengers change stages here. This is an old mining camp, and has given some rich results in past days. The old channel which appears near the top of a high ridge, is nearly, if not quite, worked out. A company commenced hydraulic work here lately under the impression that the channel ran in towards the town side; but not finding sufficient pay, they abandoned that portion of the enterprise, and now contemplate working on the opposite side. The town consists of a good hotel, two stores, an express office, many pleasant residences, and a good livery stable. There is also a first class saloon, kept in city style, by Mr. Charles Gray, formerly of San Francisco; he is always ready to "minister" to the "spiritual" wants of travelers who happen along that way. I am informed by good authority, that there has been more travel over this road during the last six months, than for a similar period for some years. Our party consisted of three, whose object it was to visit a mining property some ten miles from this place. Mounted on good horses and getting an early start, we passed over Willow Creek, a location which has been noted for its richness, but is now "worked out." We passed Dad's Gulch which is quite a little settlement with some good claims. We next came to the Slate Range House on the top of the ridge, and kept by an old man as a trading post. This was once a flourishing post, when occupied by the Tompkin boys, and while they were running pack trains to and from Marysville.

Continuing on the trail, we soon descended to the North Fork of the Yuba river, to what is known as Bullard's Bar. We found the men were off at work, the ladies only, being at home. H. knew the family, and called on them. A pretty, curly-headed miss opened the store for us; she declined selling us any liquor, as she belonged to the Good Templars; but she was willing to sell us all the cigars we wanted. The ladies were in the midst of preparations for a grand hall, which was to come off soon. Forging the river, we found the Godfrey boys working a portion of the bed of the stream which was overlooked by the early miners. The water being very low this season, they were working profitably; taking out one hundred dollars per day to four men. The trail on the opposite side was very steep and rough, and even C., familiar as he is with Sucker Flat and Timbuctoo, thought it a decidedly hard road to travel. We soon reached

Big Oak Flat,

In Yuba County. The first claim we saw was the Black Crook, which was located some two and a half years since by Robert Parton, Esq., who is now in Arizona. It is owned at present by some San Francisco gentlemen. The gravel shows itself some thirty feet in height, and is very much washed. This mine faces on Rock Creek side of the ridge, and is situated between Slate and Rock Creek. Some work has been done on this claim. A tunnel was run in a short distance, and a side drift run 50 feet, all the way through gravel which prospected from 10 to 20, and as high as 50 cents to the pan. The parties owning the ground have been misled by the impression that during the winter and spring there would be large quantities of snow upon the ridge, which would prevent them from working the mine to advantage. By going up the ridge a short distance, the mine can be opened by hydraulic at quite a small expense compared with the cost of other mines in this part of the country, as the ridge in places is quite narrow, and has a splendid fall on the Rock Creek side.

The mine adjoining this is known as the Manhattan claim and is chiefly owned by San Franciscans. They have a tunnel run in some 400 feet, and have a good deposit of gravel, known in some mines as the boulder, or outside wash of the main channel or inner basin. The hard cement comes in at the end of the 400 foot tunnel and shuts the gravel out. Those who are judges of this class of diggings say the pay deposit or channel will come in not far from 200 feet, after going through the hard lava

or cement some 50 or 100 feet, and then strike the soft pipe clay which lies next to the gravel deposit in the main channel. They also think the hill contains a basin, and that rich deposits of gravel can be found the same as those at Scales', Brandy City and San Juan North. This ridge has all the natural facilities for making a permanent mining district. Passing several places, which I will mention hereafter, we finally reached

Grass Valley

The most important and prosperous quartz region in California. We found the great center of attraction, apparently, to be Alta Hill, some three-fourths of a mile from town, since the Hope Gravel Company have found a rich deposit in the channel of the old Blue lead. Miners are making locations to try their luck once more, and all the ground that there is on the hill has been taken up, and some companies have taken more than really belongs to them, for fear they may not find it on their own ground.

The Hope Company have a splendid mine, and I am glad to say it is as well managed as any mine I have seen in the State. Mr. Bower, the superintendent, and Mr. Ham, the financial agent of the Company, conduct its affairs on safe and economical principles. We were not shown any crooked tunnels, nor did we hear of any unnecessary break down of machinery.

The Company are contracting for a new bed rock tunnel, some 500 feet in length, and to be 16 feet lower than any level in the mine. When this is completed the whole underground mining can be done with ease and dispatch, and can be worked at a distance of 3,000 to 5,000 feet without having to sink any more shafts. It will connect with the east drift, where the richest deposits have been found. The body of gravel in sight in the drifts and breasts are sufficient to encourage any set of stockholders. The hard cement that cannot be washed is thrown one side, and will be worked by mill process, as soon as the company decide to erect a mill. Twenty-three pounds of this hard cement was recently worked under stamps, and through a small steam pan in San Francisco, with a result much greater than had been anticipated. The dump pile contains tons of this cement, and during the last week but one, more than usual has made its appearance in the drift now being opened. The mine gives evidence of being permanent and lasting. Mr. Bower in speaking of the hard cement, says, "I have now over 500 tons of such as the sample in box on the surface ready for milling; and also a large body of the same material in the mine ready for breasting out."

From the 17th of September to the 5th of November, eight weeks, 541 ounces have been taken out, while the mine has been worked to great disadvantage by not having the bed rock tunnel low enough. The tunnel is being cleaned out by contract, to make a connection with Hope Shaft, so in case of a wet winter, water will only have to be lifted from 70 to 80 feet, by means of a 12-inch Cornish pump.

The company has been assessed for the last four years, and at the time of finding the deposit, the company was not greatly in debt, either in San Francisco, or at Grass Valley. As they are now doing so much dead work, it can hardly be expected that a dividend will be paid during the month of November.

November 7th.

CROOKS.

Notes of Travel in Yuba and Sierra Counties.

[Written for the Scientific Press.]

CAMPTOWNVILLE, 41 miles from Marysville, is the most northern mining camp of Yuba Co. It has suffered greatly from fires in years past, but, as a mining camp, up to within the past two years, was rated among the average in the State; at present but little is doing right in the vicinity. CAMPTOWNVILLE CLAIMS. Hugg & Co. are proprietors of all the principal claims adjoining the town, not working at present. CAMP BRIEN CO., adjoining the claims of Hugg & Co., are owned by Jones, Williams & Co., and worked by hydraulic process, during the season of water. HORSE VALLEY DIGGINGS, placer mines, one mile north of C., are owned by Diamond & Co. After being worked for the past 14 years, they still satisfy the proprietors. AT SLATE RANGE, two miles north from Camptownville, the WEEP'S POINT claim, owned by Clow, Sailor & Purenton, and superintended by Wm. Sailor, work five men during the season of water, and run two ordinary pipes, working by hydraulic process.

INDIAN HILL, Sierra Co., seven miles northwest of Camptownville. The principal diggings are owned by Welker & Co., (J. Welker, C. McIntyre and A. McKie). The common pipe and distributor is the only device that has yet found its way here. The main supply pipe is only 11 inches in diameter, too small and inadequate for work, using scarcely 300 inches of water. It is a very rich, hard, cemented gravel, from 50 to 200 feet deep, and the channel is from 500 to 2,000 feet wide. By the present process four men wash out \$100 per day on the average; but with a large supply pipe, (say 18 inches), and some one of the many hydraulic devices in the line of monitors, which could receive 450 or 500 inches of water, these diggings could be made to pay fabulously. Gold is of-

ten visible 30 feet from the bed rock. A strange peculiarity about these diggings is that all the heavy boulders and nearly all the coarse gold is found in the upper 30 to 50 feet.

Crow & Co.'s claim, 1½ miles south-west of Indian Hill, consists of 5,000 feet of rich tailings in Indian Creek—the hydraulic washings from Indian Hill. This claim pays good wages and is worked the year round. R. H. Bliss & Bro., own the water privileges on this hill, and also own and work a fair proportion of the diggings. At GRISLEY HILL, 2½ miles further distant, Messrs. Selferage & Co. and Sharp & Co. own all the mines. They work with common pipe, washing only during the water season, which commences after rain begins to fall in winter and stops about the 1st to 15th of June. These claims are similar in every respect to those on Indian Hill, and, on the average, pay well.

BRANDY CITY, 1½ miles further west, is quite a little village of 100 inhabitants. J. Jones keeps the Public House (and a fair one too). The mines, principal store, water privileges, &c., are owned and run by P. S. Van Rensselaer. He works from 30 to 100 men; his claims consist of about 500 acres of rich hydraulic washings, from 100 to 300 feet deep. Twelve miles of his ditch is solid flume, with a saw mill in running order at either end, the whole of which property is valued (by outsiders) at over a million dollars.

MARBLE VEIN. Six miles north of Camptownville, at Slate Range, Mr. V. C. McMurry has located a very fine marble quarry. The croppings are 80 feet high by 100 feet wide. A specimen may be seen at the office of the *Examiner*, San Francisco. From its look I should say it was susceptible of a very fine polish.

GOON YEARS BAR. The diggings here are in the bed of the river (Yuba) and the principal mining is done by Chinamen. A very few white men are dragging out an existence at this place, and from their conversation I think their entire interests could be bought out for lottery tickets, at par, drawing one chance in 319.

DOWNIEVILLE. Four miles further up the Yuba, and 21 miles from Camptownville, is Downieville, the county seat of Sierra Co., which is reached by stage from Marysville, at the same fare charged 20 years ago. My advice to travelers having to stop over along this road would be to take their own conveyance and horse-feed, and lunch enough to last to the Oregon House, 24 miles from Marysville. Downieville at present is rather thriving. A new County road has just been completed to Sierra City, 12 miles distant, and is to be continued to Sierra Valley, 18 miles further; estimated cost, \$30,000, or about \$1,000 per mile; \$15,000 were by private subscription, which shows a considerable of enterprise, to say the least. C. C. Darling & Co., of Downieville, are running a daily stage to Sierra City, of which I will speak further along. Four different branches of the main Yuba River, fork at or near Downieville; at or near the mouth of the East Fork is situated a fine saw mill, owned by B. Panly, three-fourths of a mile from town.

About 1½ miles from town, at the junction of the North and Middle Forks, on Wisconsin Flat, is situated the McMillan Mine, owned and superintended by S. K. Sale. This is a deep channel, blue gravel, lead putting into the mountain, worked by hydraulic process; seven men are employed; the pay is principally coarse gold, and quartz bearing. The claim has only been opened about 60 days; from indications in the ground sluice a handsome clean up is anticipated.

The GOLD BLUFF mill and mine are just opposite the McMillan, on the North Fork of the Yuba. This is considered one of the first quartz leads of Sierra Co. It is superintended by H. C. Tewes. They have a 12-stamp mill run by water power, night and day, Sunday included; work from 25 to 30 men, and crush from 18 to 20 tons per day. From where they are now working, the rock is landed at the mill by an incline, down the side of the hill, the loaded car down drawing the empty car up; their tunnel is in 1,600 feet and strikes the ledge 550 feet below the croppings. The rock is soft, run with but little cost, no hoisting works nor drainage tunnels are needed and there is free water to run the mill; what they clean up is nobody's business, as the mine is not for sale.

The SIERRA BUTTES quartz mine is situated 1½ miles north-west from Sierra City, and under the shadow of the Downieville Buttes themselves, which tower up 8,200 feet above the level of the sea. The company have two 16-stamp mills in operation on the mine, and another 40-stamp mill in course of erection, to be in running order on the 1st of next month; J. T. Hanks is superintendent. They are at present working 80 men, 20 of whom are preparing rock for the new mill. With the two 16-stamp mills they crush some 50 tons of rock every 24 hours. They are working from five different levels, all of which are run in from the face of the vein. The company own three distinct ledges, varying in width from five to twenty feet. This is one of the oldest and best paying mines in the State, having never levied an assessment. It is near this point that the big 95 pound chunk was taken, which has created such a sensation at Woodward's Gardens in your city.

CHURN EXTRAORDINARY. Midway between Good Year's Bar and Downieville, resides Thos. B. Parke who is the inventor of a churn that will accomplish the arduous task of making butter in one minute! So I am informed by men of integrity who have seen the operation performed. Oh, ye proprietors of the Old Barrel and Dasher, read the above and weep.

L. P. Mc.

Mechanical Progress.

SLIDING OF BELTS.—The *Technologist* says that by the simple covering of the pulleys with leather, attached with glue, ventilators, which hitherto made only 1,100 revolutions per minute, were caused to make 1,400. In a steam mill with five run of stones, each set ground twenty-seven bushels per day to twenty four before. In a paper mill, a rag engine did 15 per cent. more work than before. A spinning-machine was made to produce a uniform thread, while before the pulleys were covered, it produced a thread containing knots and uneven spots. Moreover the belts lasted considerably longer than before.

MACHINE FITTING AT THE LINCOLN IRON WORKS.—The *Engineer's* report of the Annual Meeting of the Institution of Mechanical Engineers, includes an account of a visit to the Stamp End Works at Lincoln, from which we quote briefly:—"The principle of interchangeability of the parts, is here carried out with small engine work. In whatever part of the world an old Stamp End engine may be, on sending it a number any duplicate part required can be at once forwarded. The ends, straps, and cotter holes, for instance, of every connecting rod are slotted and shaped out to fit; the half-round edges of the cottars are shaped in a peculiar lathe; and the only hand-work left to be done is just to take off the arranges. The eccentric sheaves, with a half round groove, are centered on a chuck made with taper wedges that hold it on being screwed up, and the half-round groove is cut out by a tool fixed in a slide made to oscillate on a pin to the exact curve. The eccentric straps are cast together, to be afterwards slotted in two, leaving a small space for a packing piece. The out-sides are turned in a lathe fitted with a tool box, oscillating on the slide rest to the exact curve required. The pair of cylinders for their two-cylinder engines are in one casting, and with the regulator valve. They are bored in a special lathe; then, on being fixed in two brackets with cones, the valve faces are planed out, the faces of the flanges turned up in a lathe, and even their out-sides slotted in a machine, of which one tool cuts during the downward stroke and the other during the return. The curved bottoms are planed out in machine with a tool-box travelling radially to the curve of the outside of the boiler. The stuffing-box glands are slotted out by a tool caused to traverse to the curve required, on the same plan as the Blanchard copying lathe. A tool for drilling out the holes in the boilers, consists of a radial drill, furnished with a supplementary horizontal drill able to slide vertically up and down. The boiler, resting on a framing simply fitted with friction rollers, and itself borne on a central screwed pin, can be easily adjusted transversely to its length, and as easily be turned completely round on the central screwed pivot."

A "GENERAL JOINER."—"Messrs. Robinson's general joiner is practically a combination of four machines on one frame, each "division" being provided with its own independent starting and stopping gear, so that if four men are using the machine, their operations do not interfere with each other. One section of the machine forms a circular saw bench, the saw being capable of being replaced by a cutter disc for planing and squaring up. A second section is a moulding machine capable of working mouldings or skirtings up to 9 in. wide by 3 in. thick; while a third division is a turning and boring machine, this division including arrangements for scribing shoulders, &c. The fourth division is a band-saw machine, while, by removing the band-saw from its pulleys, use can be made of a circular moulding apparatus fitted up in connection with the band-saw table."—*Engineering*.

NEW SNOW-PLOW.—The old one rams the stuff to be removed until it becomes harder and harder. The new one shovels it up and carries it off. The *Railroad Gazette* describes it: A truck is furnished forward with a sloping platform, the front edge of which is just above the top of the rails. A pivot bar permits the platform, when loaded with snow, to fall back into a horizontal position. Truck, platform and snow are then run by the engine backward to some embankment. Two side wings, hinged to the platform, are let drop, and the load of snow is dumped down the slopes of the embankment. Strong cog-wheel gearing and iron chains to a standard behind the platform operate the concern.

A NEW CENTRIPETAL POWER.—Of this recently patented arrangement the *Mechanic and Inventor* thus speaks: "This method of rotating shafts at a high speed has been discussed, and the results claimed doubted. Seeing is believing, however, and we have seen enough to satisfy ourselves that for many purposes it will certainly supersede the old way. The shaft or arbor of a circular saw, for instance, is journaled in the usual manner near the saw-end, the other end being supported on a single friction-wheel, journaled under it. Two band wheels are journaled parallel with the axis of the arbor with which their peripheries roll in contact, motion being communicated from one band wheel to the other by a belt passing around both, whereby the power of one wheel is communicated to the arbor as a friction wheel on one side of it, while the other band wheel in contact with the other side also communicates its power thereto, so that the usual thrust in boxes is done away with; the weight of the belt being sufficient to keep the band wheels in contact with the arbor, which is faced with leather at the point of contact. We have tested its work in sawing boards, and can safely say that one man can nearly do the work of one horse, as compared with machines of the usual construction."

THE TANITE EMERY GRINDER.—The *Artisan* says this is rapidly growing in favor. It is furnished with two rests; one arranged to support work before the face of the wheel, the other at the side. "The mechanic once fitted out with a tanite emery-grinder, with all its overhead work and varied rests, and with a good assortment of wheels, possesses a machine which supplies the place, to a great extent, not only of the file and the grindstone, but of the lathe and the planer, besides doing quickly and cheaply much work for which a special machine would otherwise be required."

SOREL'S ARTIFICIAL STONE.—A company has been formed in Boston for the manufacture of artificial stone, according to the method of Sorel. The base of this stone is a cement—calcined magnesite, in some suitable solvent. The process consists in mixing the magnesite cement with suitable material; with sand it gives brick; with flint, wet stones and oil stones; with kaolin, ornaments of all kinds, statuettes, etc.; with sawdust it gives a good material for covering floors; with carbonate of lime imitation of marbles.

MUZZLE VS. BREACH.—In an article on "Field Artillery," *The Engineer* says: "It has been finally settled that breech-loading guns possess no advantage whatever over muzzle-loaders, save one of very doubtful importance. It is claimed for breech-loaders that light iron mantlets can be used to screen the gunners from hostile riflemen, which mantlets cannot be used with muzzle-loaders. This is partially true, but when we bear in mind the disadvantages which attend the use of all breech-loaders yet made, the ease with which they are placed *hors de combat*, and the enormous difficulties met with in timing the explosion of shells fired from them, we confess we see no reason whatever for believing breech-loaders to be anything else but inferior to muzzle-loaders."

ROLLING RAILWAY AXLES.—The *Engineer* briefly describes a recently invented machine for doing this. Heretofore railway axles have been shaped by hammering. The machine in question having not yet been tested, we devote no space to particulars.

GLASS FOR BEARINGS.—The *Chicago Mechanic and Inventor* says that several railroad companies have adopted the glass bearings and are fitting their locomotives with them. The patent covers the use of glass in all working parts of machinery. It has been applied to cross-heads, packing-rings, link-blocks, and eccentrics, as well as shaft bearings.

SOMETHING NEW ABOUT GUN COTTON.—At the New York Lyceum, "Professor Seely gave information of an extensive use, just now, in the manufacture of imitations of ivory, for billiard balls, etc., of a newly discovered property of gun-cotton of being softened, rendered plastic, and compressible, by incorporation with camphor. A collodion may be made by dissolving gun-cotton in an alcoholic solution of camphor. He has discovered also that gun-cotton will explode in the vapor of camphor at a temperature as low as boiling water."

Scientific Progress.

"NATURE" ON WALLACE.—An article in *London Nature*, upon Wallace's "Contributions to the Theory of Natural Selection," has the following:—"The working of the law of natural selection on the human race, is probably the most difficult, as it is the most interesting, of the questions affecting the origin of animal species. * * Mr Wallace shows how mental and moral qualities must interfere with the absolute carrying out of the law, &c. * * But, beside and apart from the operation of the general law of organic life, with these various modifications and restrictions, Mr. Wallace believes that another and independent cause has been at work in the evolution of the human frame, and that this has been a supernatural one. He maintains that the large size of the brain in man, the scantiness of his hairy covering, the great specialisation of his extremities, and some other peculiarly human characters, cannot be explained, except as the result of the direct action of the Creator's will. * * The theory of divine artificial selection supplying the deficiencies of natural selection in the formation of man may, we think, be at once met by the following considerations. The theory of natural selection does not suppose a kind of large female divinity, whose name is Nature, and whose function is to select from animals and plants those fittest for survival. The theory rests, as Mr. Wallace, in another part of his work, is careful to remind the reader, on proved certain facts which necessitate the survival of certain forms by virtue of the proved physical laws which we see in daily operation. But these so called laws are, to all who believe in a Creator, simply the manner of His action. To say that our brains were made by God, and our lungs by natural selection, is really to exclude the Creator from half His creation, and natural science from half of nature. All the phenomena we know are of necessity ultimately referable to the First Great Cause: the object of science is to discover their secondary causes; and if the theory of natural selection does not explain how the larynx or the brain of man were developed, then we must try to find another which will. To fall back for explanation upon the primary efficient cause of their existence and the design with which they were framed, is only to confuse two distinct branches of inquiry."

May we not be allowed to suggest, that although we have not seen Mr. Wallace's book, we believe his idea to be really this, viz: that the operation of the law of natural selection is, in man, essentially modified by his consciousness of the existence of a Supreme Creator. This consciousness causes him to be more or less *en rapport* with that Creator; and it is easy to see that (on the supposition that such Creator exists) man is therefore, so far, an exception to the rest of creation. Brain action certainly modifies development; and here is an outside inducer of brain action, an outside thought—prompter,—which no other organism has, reached the stage of development which make such consciousness possible. This does not make the doctrine of natural selection any the less true. On the contrary, it is, in our belief, quite possible, that the sooner scientists admit the existence of this modifying element, the sooner will the truth of that doctrine become clear to them. [Eds. Press.]

RELATIONS OF SILICA TO LIFE.—At a late meeting of the New York Lyceum of Natural History, "Prof. Wurtz presented a new theory, or generalization, of the *Relations of Silica to Life* throughout all geological ages. He exhibited an elaborate diagram, representing the "Geogenic Migrations of Silica throughout the Kingdoms of Life," and brought forward, among other peculiar views, which he proposes further to sustain, in future communications, the new Postulate that all Silica, in isolated forms, even when crystalline, as quartz, owes its primary isolation from the original silicates of the continental nuclei to the agency of Plant-Life."

VENOM OF THE SCORPION.—M. Claude Bernard has been experimenting with this by inoculation upon tree frogs. He found that it caused the red globules of the blood to become at once agglutinated together, thereby obstructing the circulation. The extent of the action was in proportion to the quantity of the poison.

CROSS-FERTILIZATION IN PLANTS.—From a paper by Alfred W. Bennett, F. L. S.: "The arrangement of the reproductive organs in hermaphrodite plants, the presence in the same flower of both pistil and stamens, suggested to the minds of the older botanists no other idea than that of fertilization. It is, however, now generally admitted that, even in hermaphrodite flowers, cross-fertilization is the rule, self-fertilization the exception. Two sets of facts have been especially observed,—in particular by Darwin in this country, Hildebrand in Germany, and Delpino in Italy,—to favor cross-fertilization in hermaphrodite flowers; the phenomena of dimorphism and trimorphism, and the special arrangements which render it easier for the pollen to be brushed off by insects visiting the flower than to fall on its own stigma. But, besides these, another arrangement exists by which self-fertilization is hindered, the simple fact that the stamens and pistil belonging to the same flower are frequently not ripe, so to speak, at the same time."

CHEMICAL TESTS FOR MIXED FABRICS.—J. C. Spiller, F. C. S., read a paper before the Chemical Section, in which he refers to the fact that silk alone, of all the materials ordinarily used in textile fabrics, is soluble in concentrated hydrochloric acid, so that this reagent may be resorted to for testing the purity of silk, and also for determining the proportion entering into the composition of mixed goods. For identifying wool in the presence of cotton, flax, &c., it is recommended to immerse the fabric or fibres in a warm aqueous solution of picric acid, which dyes the wool a bright yellow, without imparting any color to cotton. Thus, by testing mixed fabrics successively with hydrochloric and picric acids, valuable indications are afforded regarding their constitution. The chemical properties of certain compounds formed in this manner from silk were described, and a photographic application pointed out which turns to account the extraordinary degree of sensitiveness to light exhibited by a modified form of argentic chloride produced by precipitation from such hydrochloric solutions.

PHOTOGRAPHING SUN SPOTS.—The *Journal of the Franklin Institute* thus describes the plan adopted by Prof. Winlock, of Harvard: "A tin tube, some 40 feet in length, is supported in a horizontal position about north and south, and carries at its north end a lens of six inches aperture and 40 feet focal length. The other end of the tube enters a small house which serves as a photographic dark-room, and is there provided with the usual adjustable plate holder employed in an ordinary camera. At a short distance in front of the lens, or north end of the tube, is set a plate of unsilvered glass, slightly wedge-shaped to avoid the reflection from the second surface, so mounted as to follow the sun, and throw the reflection constantly on the lens. The image of the sun on the sensitive plate is about 4 inches in diameter, and so greatly over all errors of the lens reduced by the long focus and small aperture of 2 1/2 inches, that with a common uncorrected glass the most admirable pictures have been obtained. The exposure is regulated by dropping a diaphragm-slide outside of the lens."

"COLD FUSION" BY LIGHTNING.—This was a theory of Franklin's, afterward rejected by him. Prof. André Poëy says it is, however, perfectly admissible in accordance with our present knowledge upon the thermo-mechanical action of electrical discharges; and M. Riess has shown that the incandescence, fusion, and pulverization produced by discharges of a certain intensity must be due to a mechanical and not a thermal effect. In this connection, we quote Prof. Poëy from the *Journal of the Franklin Institute*: "To a cause purely mechanical, analogous to that of Franklin's cold fusion, we must attribute very frequent occurrences of the following kind. A thunder-bolt having struck a magazine containing 800 casks of powder, reduced two of them to fine particles without igniting any of the powder. In this instance the lightning discharge acted as a dynamical force without liberating heat. Other effects analogous to the foregoing consist in its melting only the extremities of the metals traversed by it, and not heating them (in their length) sufficiently to disarrange every combustible supporting them. These results are evidently due to the instantaneousity of the discharge, which produces the mechanical action of molecular disgregation before the molecules of the thunder-struck body have time to become heated."

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

GLOBE.—*Miner*, Oct 29th: The grading is being done for the Mill at this mine, the lumber is arriving, and machinery entire for the mill is already on the way. We saw some rock from the face of the main tunnel this morning which is an improvement on any yet found.

PUMPING OUT.—The Schenectady is being freed from water in the upper works, preparatory to making the connection from the lower, the winze being very near through.

GOOD CROPPINGS.—Just over beyond the Monitor tunnel number three, is a large body of ore bearing rock which holds precious metals to the very top. This is a vein of the Tarshish which has not yet been penetrated. Mr. Lewis has taken rock therefrom, and a dozen assays go from \$7 to \$56 per ton in gold and silver. The Silver Gance tunnel is running directly for this ore vein.

AMADOR COUNTY.

KENNEDY.—*Ledger*, Nov. 5th: We visited this mine last Tuesday. The new hoisting works, will be in running order in about four weeks. The engine and boiler to be used are the very best.

CALAVERAS COUNTY.

RAILROAD FLAT.—*Cor. of Chronicle*, 5th: The Buckeye lode, which suspended operations on account of the insufficiency of the works to keep the mine clear of water, is again to be placed in working order. H. N. Sargent, has the necessary machinery on the ground. Parties owning the old Cook & Smith lode have been for some time running a tunnel to the shaft to drain it; they are now on the eve of tapping it, and will soon be taking out rich rock. The Swank Bros. have taken some excellent rock from their mine, which is the extension of the Petticoat. The amount of rock out will not fall short of a thousand tons. This accumulation is owing to the stopping of the mill for alterations.

CHAPMAN & Co., at Railroad Flat, are running a tunnel to intersect their lead. They are in 190 feet and will reach the vein in a few weeks, cutting it at the depth of 70 feet. From the shaft previously sunk, first-class ore was obtained. The tunnel is for the purpose of draining the mine.

EL DORADO COUNTY.

GEORGETOWN.—*Cor. Placerville Democrat*, Nov. 5th: The Taylor mine keeps paying and looks encouraging. All the miners are making preparations for winter, and the hope of every one is for rain. The ditch remains quiet, but I have been informed that it will come next year. The parties decline to form a stock company unless \$50,000 would be subscribed on this divide.

INYO COUNTY.

STOPPED BY SNOW.—*Independent*, Oct. 31st: The transportation of ore, at Cerro Gordo and at Kearsarge, has been suspended on account of the snow. The operations will soon be resumed in both places.

NEW DISTRICT.—Messrs. Egan, Watt and Bennett returned on Thursday from a prospecting tour. They found extensive leads of very pure galena in Darwin Cañon, a mile south of the trail to Death Valley. The miners are conveniently situated, wood and water being abundant. This region lies 20 or 25 miles southeast of the Belmont mine at Cerro Gordo. A new district has been formed, called the "Granite Mountain."

NEVADA COUNTY.

ITEMS.—*Gazette*, Nov. 2d: All the Chinese companies, seven in number, from Wood's ravine to Stocking Flat, have resumed work in Deer creek.... Same of Nov. 3d: The Erie mine, at Eureka, owned by Veatch & Co., is yielding splendid ore. Last week, from a thirteen days' run of a thirteen stamp mill they cleaned up \$8,000. The rock averages over \$30 a ton.... Same of Nov. 5th: The Coe mill is now crushing rock. It has been idle some time, as the company have been sinking their main shaft and running drifts.

YELLOW DIAMOND.—*Transcript*, Nov. 1st: This Co. has been taking out some excellent rock from a new ledge on Brush creek. Four hundred pounds have been taken to Maltman's for prospecting, and it is estimated will yield at the rate of \$200 to \$250 per ton.

NORTH BLOOMFIELD Co.—This Co. has a party out surveying a ditch to carry water from Humbug Creek to Grizzly Hill. The shaft they are sinking to the bed rock is

down 125 feet, through 30 feet of blue gravel which yields a good prospect of fine gold. They are also making preparations to sink another shaft in the old Hillerschiedt claims.

EUREKA TOWNSHIP.—Same of 4th: Just above Orleans Flat new prospects have been found, indicating a continuation of the channel. At Snow Point a tunnel is being run to open the gravel. Between Eureka and South Fork good gravel prospects have been found, and at the former place are a number of excellent quartz ledges. The Jim, Black & Young, Birchville, and several others were doing well.

OMEGA.—As soon as winter comes, nine hydraulics will be started. Only six were worked last year.

LITTLE YORK.—A considerable amount of prospecting is being done. An the ridge, a large amount of capital is invested. Prospects at Quaker Hill are excellent.

ROUGH & READY.—McSorley & Co., Webster & Co. and Hayes & Co., with others about Randolph Flat, will soon be ready for work. At this point some rich discoveries were made last Spring, and the miners have been opening the ground for regular work.

MEADOW LAKE.—The Grant Co's. mill is about completed, and will soon start up. A new furnace is to be put up for roasting ores, and a number of men are prospecting. Recently copper ore has been struck.

ITEMS.—*Grass Valley Union*, Nov. 1st: The October returns for the Eureka, gave \$53,000. Profits for the year, \$429,487.... Empire mill is being rapidly reconstructed. The new mill will be at work about January 1st.... Perrin's 16 men keep the mill running. Last week they took out 40 ounces, and the week before, 43.... The lessees of the Dromedary have contracted for a 5-stamp mill.... There are two Phoenix ledges. Pat. Hennessy's pays \$20 to the ton in the croppings. Four men get out four tons a day for \$3.50 per ton.... Wild Emigrant grows better and is widening. The rock is worth \$40 per ton.... Very rich rock coming out of the North Star.... The Pennsylvania, on Kate Hayes' Hill, has kept the Gold Hill mill running on good rock for several days.... The Orleans Shaft, 75 feet deep gives rock with free gold plainly visible.

THE GRAVEL MINES.—Same of 3d: The Hope Co. made a very good run last week. Sixty-seven ounces of gold were washed out, and the tailings are good for much more.... Webster & Co. have found a wide channel, which contains a large amount of pay gravel, and will sink a shaft from the surface for hoisting the pay dirt. This company have diggings good for \$20 a day to the man.... The Alta Co. No. 3, have machinery which will be used in sinking for the lead.... McSorley & Co. will have their tunnel completed in a few days, when their flume will be lengthened and piping commence.... The Town Talk Co. are waiting for water to run their cement crushing mill. A fine "chunk" of the rich metal was picked up after the rain, worth in the neighborhood of \$50.

PLACER COUNTY.

DUTCH FLAT.—*Stars and Stripes*, Nov. 3d: Plug-Ugly Hill is one mile south of town, and a spur from the main ridge, crossing the line of the great Dutch Flat pay lead. It is in the same range with the Somerset, Jehoshaphat and other rich mines south of Dutch Flat. The Summit claims, owned by the Rablin brothers and others, take in the entire lower portion, and embrace one hundred and twenty three acres of mining ground, to which the owners have applied for a patent. Their preparations for work include a supply-pipe of heavy iron, 30 inches in diameter at the head, thence tapering for 250 ft. to 14½ inches. Of this diameter there is 4,500 feet, and then comes 1250 feet of 11 inch pipe, making in all one mile and one seventh. The fall is about 300 feet. The outlet of the washings will be through a tunnel five feet wide and seven high in the clear. Below the tunnel are a succession of "under currents."

RICH POCKETS.—Within the past week A. O. Bell and the Evening Star Co. have made rich strikes in their respective mines, in the vicinity of Rock Creek and Bald Hill. The latter are reported to have taken out \$5,000 in the space of a day or two.

COLFAX.—Last Sunday we saw a piece of quartz from the Rising Sun Mine, a sample of several tons taken out within a few days, which made a liberal showing of gold. This was from the three-hundred foot level.

SOLD OUT.—*Herald*, 5th: We learn that the Battis claim on the Shipley ledge has been sold to McFadden and Sears, for \$4,000. The claim covers 1,000 feet of a heavy ledge and shows finely as far as opened.

SHASTA COUNTY.

SOUTH FORK.—*Courier*, 5th: We understand that the new proprietors of the Chicago mine have a force at work developing the ledge and taking out quartz. Some of the rock is said to be very rich, portions containing native silver.

SISKIYOU COUNTY.

SCARCITY OF WATER.—*Yreka Union*, Nov. 2d: Water has become so scarce that Lash & Co., are able to run but five of their fifteen stamps. No such scarcity was ever before known. Jones & Co. have their mill in condition for running at the Forks of Humbug, but they have so little water that it does not pay to bother with it.

WILL PROSPECT.—Squire Barry of Humbug has sold his claim at French Flat, and intends to devote himself this winter to the prospecting of a quartz ledge on Punch Creek.

VIRGINIA BAR.—This is on the Klamath River four or five miles below the mouth of Humbug. It is an old mining district. The most important claim at present is the one owned by Penninger & Co. There are four partners, and they take out regularly four or five ounces a day. Their claim embraces ground enough for twenty years.

TRINITY COUNTY.

THE DEEP HOLE.—*Journal*, 5th: This is down 135 feet. The shaft is now below the hard bed-rock of which we spoke; the bottom is in a hard cement gravel, showing no gold: water is increasing.

TRINITY CENTER.—H. M. Whitmore & Co. will put in a big flume this season, and mine Weaver fashion.

MARSHALL & MASON'S.—The claim on Union Hill above Douglas City, will not be worked this winter for want of fall. It is contemplated to run a bed-rock tunnel from Trinity river under a ridge between the river and their claim. The richness of their ground has been tested by several years' work, and by prospecting tunnels that paid ten dollars per day for running.

THE BIG FLUME.—There has never been a work of the magnitude and importance of the Weaver creek flume within our knowledge, about which so little was said by the parties interested. The company have already laid down thirty-seven boxes and intend to put in seventeen more. Each box is twelve feet long and sixteen feet wide, is partitioned inside, sided ten feet high, capped and the bottom paved with ten inch blocks.

Nevada.

COPE DISTRICT.

ITEMS.—*Elko Independent*, Nov. 5th: The Norton Mill commenced running Tuesday. The mill is of thirteen stamps.... The Mountain City having a new Supt. work has again commenced.

BULL RUN.—*Cor. of same*: "Affairs look promising. There are 150 miners in the district, most of them making preparations for winter. The mines generally are looking well. On the different dumps there are one thousand tons of rich ore. Some has been shipped which paid well. The Hope mine owners bonded it to Mr. Fogus, of Silver City, Idaho. This is the richest mine in the district. Its course is due north and south, and the ore assays \$400 to \$10,000 per ton. It was discovered by W. D. Porterfield and Virgil Bartlett, of Mountain City, last June, but did not prove so rich until after they had done considerable work. All we want here is mills and capital."

ESMERALDA.

THE DUNDERBERG MINE.—*Cor. Enterprise*, Nov. 5th: I have visited nearly all the most valuable mines in California and Nevada and the Dunderberg beats them all. It is a true fissure vein 20 to 30 feet wide, running nearly north and south. From the shaft, which is down 50 feet, the rock has paid in mill process \$50 to \$100 to the ton; the gold largely predominating. There is a tunnel in 600 feet which taps the ledge near 300 feet from the surface. Drifts have been run along the ledge 200 feet. Good ore has been found all the way—some assays have given \$2,000 to the ton. Some ore was taken out to-day which I am satisfied will mill \$5,000. I send the result of four assays which, as you will see, average \$250 to the ton. In these samples, silver predominated. Dr. Munton is working 30 men in the mine. The Doctor stuck to it after others that were interested refused to invest another cent in prospecting the claim. A 10-stamp mill which Mr. Dague is erecting will be completed in two weeks.

REESE RIVER.

ITEMS.—*Reveille*, Nov. 1st: During October there were shipped from the office of Wells, Fargo & Co. in this city, 55 bars

of bullion, weighing 4,734 pounds, and valued at \$74,295 76.... We are informed that work on the Tolyabe mine, Lander bill, had been resumed with every prospect of success.... A very fine lot of ore from the Page and Corwin mine, Secret cañon, 70 miles southeast from Austin, has been brought to the Manhattan mill for reduction.

SILVER BEND.—A correspondent at Belmont informs us that there was a pleasant time, on the occasion of the completion and use of the steam hoisting apparatus on the El Dorado South mine, Oct. 31. All the residents of Belmont were present. The first note of the steam told of a new era in mining in that district.

MINERAL HILL.—The *Elko Independent* of Nov. 5th learns that the mill is running; the town is growing, and people are coming in from all directions. A large amount of ore is waiting its turn at the mill.

A correspondent of the *Grass Valley Union* writes from Mineral Hill that the 10-stamp mill will turn out \$50,000 per month. A Grass Valley Co. is prospecting there.

WASHOE.

HALE & NORCROSS.—*Enterprise*, 6th:—The mine is yielding 180 tons of ore per day. On the lowest level, south of the shaft, there is a decided improvement in the amount and quality of the ore. It is found to extend further south than in any level in the mine. The drift east from the bottom is in forty-five feet.

OPHIR.—A cross-cut has been commenced on the south drift, while the drift itself is being driven ahead. The rock is becoming harder and water coming in.

SEGREGATED BELCHER.—The east deposit is yielding well and looking better than ever. The 350 tons of ore crushed averaged \$27.

VIRGINIA CONSOLIDATED.—The drift west for the ledge is in 716 feet. The rock is now quite soft. They are making four to five feet per day.

SACRAMENTO AND MEREDITH.—All goes well at mine and mill. They have an abundance of good ore and keep the mill in constant operation.

SAVAGE.—The drift on the ninth level has connected with the winze from the eighth, giving a good circulation of air. There are good indications south of the shaft on the ninth level. The daily yield is 80 tons.

BELCHER.—The raise above the 200-foot level is in quartz which assays \$25 to \$70 per ton.

CROWN POINT.—The incline is down 108 feet below the 1,100-foot level, and the south drift from the same level is still in barren rock. From the upper parts they are getting out 60 tons of ore per day.

DANEY.—The machinery and pumps are working finely. The shaft has been drained. Sinking was resumed on the 3d.

SIERRA NEVADA.—The mill is kept in motion and the supply of ore is inexhaustible.

IMPERIAL-EMPIRE.—The drift east from the 1,300-foot station is in 60 feet, the face showing lively quartz. The winze from the level above is down 70 feet.

CHOLLAR-PORTOS.—The mine is yielding 280 tons daily.

CALEDONIA.—The body of ore on the 300-foot level is looking fine. They are taking out 80 tons per day, and supplying the Piute and Sapphire mills.

GOULD AND CURRY.—The mine is yielding as usual. A good deal of prospecting is being done.

OCCIDENTAL.—Both mine and mill shut down, owing to financial difficulties.

OVERMAN.—There is nothing new. The yield is 60 tons per day.

YELLOW JACKET.—*Gold Hill News*, 5th: Daily yield 165 tons. from the three lowest working levels. The drift north of the 1,000-foot level will connect with the winze from the level above, to-morrow. Some good lumps of rich ore are developed at that point. At the 900-foot level, a connection will be made to-morrow with the drift from the 1,100-foot level of the Imperial-Empire shaft, south, to meet the one from the 900-foot level of the Yellow Jacket. They meet in the Confidence ground. Next week the Yellow Jacket will be one of the best ventilated mines in this section. General Winters, who has resigned his position as Supt., leaves the mine in first rate condition.

SACRAMENTO AND MEREDITH.—Some rich spots of free gold specimen ore are met with, but not of great extent. The mill is kept running to its full capacity.

WHITE PINE.

ITEMS.—*News*, Nov. 6th: O. H. Treasure presents nothing new.... South Aurora is taking out more good ore than usual. A large ore house is being built.... In Eberhardt new and valuable developments have been made during

the week. A new shaft has been started on the southern part of the mine. Aurora Consolidated is worked under contract, and shows good ore and plenty of it. In Ward Beecher, the dumps are full of good ore, which is being hauled to the mill as fast as possible. The sale to the English Co. has not been completed yet.

Silver Wedge shaft has reached a depth of 90 feet. Noonday is in good ore, and working its usual force. Virginia has only a few men at work, who are taking out rock of fair quality. Mammoth has started a tunnel on the east side of the hill. Wabash & Hemlock, on Pogonip Flat, are worked under contract. Consolidated Chloride Flat, leased by the Metropolitan Mill Co. are taking out bunches of good ore.

BANK METAL MINES.—Trench and Robinson, at Mount Ophir, are working 10 men and have 150 tons of good ore on the dumps. Imperial has 35 tons of ore out. Great Valley is taking out large quantities of good ore, 100 tons on the dump is being hauled to the smelting works. Mineral Point, on the road to Shermantown, has 18 tons out. Misco's Dream, Carbonate City, has 50 tons of fair rock on dump. Caroline, Lizzie D. and Ore, belonging to Gov. Matteson, on the west side of White Pine Mountain, are taking out plenty of ore, which is being hauled to the Governor's furnace. Yosemite is working 4 men and has 30 tons on dump. Uncle Sam has 4 men at work and 20 tons of fine ore. Jennie A.—working 16 men and, 100 tons out. Are hauling ore to their furnaces, near the Three-mile House.

MILLS AND SMELTING WORKS.—Nearly all the mills running. The Eberhardt City is progressing rapidly and will certainly be running by the 1st of January. We hear of another 30-stamp mill lying in Elko, which is to be put up in Eberhardt City. The Rothschild Works are still running. The first furnace has been running 57 days without stopping, and is likely to hold out as much longer. The refining works will be ready in a few days. Rathburn furnace is running successfully; also the Hamilton works. A small furnace behind the Big Smoky mill has been run by Mr. Everett for a short time, turning out splendid bullion.

BULLION.—Wells, Fargo & Co.'s bullion shipment during October, amounted to 134 bars, valued at \$151,005.13. Of this, 81 bars, valued at \$88,644.82, were sent Westward, and 53 bars, of the value of \$62,360.31, Eastward. The above does not include the bullion from Pioche.

ELK DISTRICT.—The Record says: The new ten-stamp mill belonging to Ely, Raymond & Burke is crushing 25 tons per day of ore from the Burke mine; the Pioneer five-stamp belonging to Ely & Raymond, crushes 10 tons from the same. The ore yields by mill process an average of \$147 per ton. The Meadow Valley mill is crushing 40 tons each day.

HUMBOLDT.

BATTLE MOUNTAIN.—A correspondent sends us, Nov. 7th, these items: The Little Giant mill, which has been running on tailings for two months, started on rock today. The mine is owned by a San Francisco Co. E. Wertheimer, Supt., employs 25 men. The mine looks well and yields finely. At Galena, the White and Shiloh mines are both turning out well. The White is owned in S. Feo. It yields 8 or 9 tons of high grade ore daily. Supt. is S. H. Knowles. They have an engine for hoisting and pumping. The Brooklyn ledge bids fair to be one of the best. At depth of 30 ft., they have a 2-foot vein of galena which assays up to \$100. The Accident, Avalanche, and Buena Vista, all look well. Lower down the coast the Butte mine yields large quantities of high grade ore, which is shipped to Reno for reduction. J. T. McLean is manager. The Confidence, Oronoco, and Toledo copper ledges all look well, and are lying still on account of the low price of copper.

Colorado.

GRAND ISLAND DISTRICT.—Central City Herald, Nov. 2d: Several parties have been negotiating for the purchase of the Idaho mine. The price asked was \$50,000. This lead yields as rich ore as ever, while the crevice has lately increased to from four to five feet in width. Several new discoveries have been made near Pugh's mine and the Boulder County, which prospect well. The Trojan lode, owned by Carter, Hines & Co., is beginning to attract attention. The ore from the main shaft, which is 45 feet deep, is rich in silver and gold. Prof. Hill is receiving regular shipments from this lode. A month ago the purchase was made of the Cariboo mine by Mr. Carter for Mr. Breed, and the west half transferred to their possession. During the past thirty days nearly 200 tons of ore have been sent to Hill's works by Mr. Carter. Of the above nearly three tons selected ore, valued at \$10,000 per ton. The remainder consists of ore which runs from 250 to 800 ounces per ton, and of 2d class, seldom yielding below 100 ozs. The ore represents a value of over \$40,000, and with the selected ore, makes a total of between \$60,000 and \$70,000 from the west half of the lead within thirty days. Between ten and twelve thousand dollars worth have been taken out in the same time, from the east half, worked by the old Cariboo.

IDAHO DISTRICT.—Gulch mining has almost ceased, and the miners gone into winter quarters. More men are, however, employed in lead mining than ever. Many mines which have been idle, are now turning out large quantities of ore, while the new silver mines of Chicago Creek promise large bullion. The Whale lead is paying better than ever. A rich pocket of 600 ounce ore has been lately struck. Dr. Rae is running his Electric process at the Myers

mill, below Fall River, on quartz from the Raymond and other lodes, and other lodes, and is supplied with all the ore he can treat. John Baker is obtaining rich gold bearing quartz from the Shafter lode in Ingle gulch. The Seaton lode is proving to be one of the best silver mines in Colorado. Mr. Womach is said to be making a thousand dollars per week.

SUMMIT COUNTY.—Eastern capital has been extensively invested in the rich placers this fall; several companies are making preparations for extensive operations in the summer of 1871. An immense number of claims have been taken up by individuals in all directions.

NEVADA DISTRICT.—The California, Prize and Rhoderick Dhu lodes, are yielding large quantities of valuable ore. Stalker's claim on the California is again producing ten ounces ore. Collins, Mackay & Co. are putting in a steam engine on No. 4 of the same lead. Their shaft is 300 feet deep with wide crevice of first-class ore. This is one of the best paying claims in the country. Davey, Veran & Co. are sinking on No. 5. They have reached a depth of 320 feet. After sinking through 85 feet of cap, they have reached pay again. The Rhoderick Dhu returns nine ounces of gold to the cord, while the crevice varies from five to eight feet in width. The coming winter will probably see more than usual activity in mining.

TRINITY.—Register Nov. 2d: On Trail creek, Thompson & Weedham have a nice piece of rich surface ore out. Stotts & Converse are driving work on the Freeland lode. The Champion is producing very rich ore in paying quantities. The Stonewall lode, is now producing extremely rich ore from two shafts. There is considerable excitement. No. 10 on the Kansas, idle since '63 is now worked by Mr. Whitcomb, who turned out a 93-ounce retort the other day from seven cords of ore.

The Georgetown correspondence of the Register gives a table showing amount silver produced in Clear Creek county during the past ten months, with the average yield per ton, for each of the principal reduction works. The average yield of all classes of ore treated in Clear Creek county for ten months, ending Oct. 27, 1870, \$123.16 per ton coin value. The same gives the yield of the Terrible lode to date as \$283,000.

GEORGETOWN.—Miner, Nov. 3d: On Tuesday last the Brown Silver Mining Company shipped a button of silver weighing 5,016 ounces, (419 lbs Troy) coin value \$6,270. Prentice lode 125 feet west of discovery carries one foot of galena and sulphurets that will run \$300 per ton. The first class ore from the Federal mine runs 1,000 ozs. to the ton. The Monticello Tunnel has struck a lode 172 feet from the mouth of the tunnel. One specimen of the ore assayed \$118 per ton.

Idaho.

ORO FINO.—Avalanche, Oct. 29: The water is being hoisted at the rate of 50 buckets per hour, each bucket holding 160 gallons. It is expected that the mine will be free of water inside of two weeks.

GOLDEN CHARIOT.—The sixth level will be worked extensively next month, and indications show that it will prove the best level yet opened.

READY.—Sommercamp, Miller & Hoffer have their Florida Mountain placer diggings about ready for spring. They have three large hydraulics and 750 feet of stout iron pipe; besides a large quantity of double hose.

FLINT DISTRICT.—The Sherman mine, tunnel and right, have been sold to a Chicago Co. for \$65,000. We understand that the property has been incorporated under the name of the Sherman G. & S. M. Co.

Black's mill is running on tailings.

Montana.

ITEMS.—Deer Lodge Independent, Oct. 29th: C. D. Everett, Supt. of the Everett Mill and Green Campbell mine, at Silver Star, writes that the mill is running regularly, with fine results, and the mine looking splendidly, with enough pay ore in sight for years. Water has been turned out of the Divide Creek ditch at Silver Bow, and mining has ceased. The same is true of Carpenter's Bar. At Elk Creek, all the large flumes are running and most of them paying handsomely. Dugan & Dooley's claims are paying an ounce per day to the hand. Henry Grant & Co. and Stone & McKibben are doing as well as at any time this year.

PHILIPSBURG.—Cor. of Helena Gazette, Oct. 31st: The Cole Saunders Co. have found out the secret in the smelting of Flint Creek ores. All that is required is plenty of lead ore to mix for fluxing, which they have been experimenting on for the last six months. The furnace started up to-day, and is running beautifully. They have made a contract for 11,000 hshls of charcoal.

Messrs. Ullery & Murrell on the Franklin lode are taking out very fine ore. Mr. Holland and James Estell are taking out fine quartz from the Western Camanche lode.

CEDAR CREEK.—Cor. of same: Powers & Co. are down thirty feet, have struck rim-rock, and drifted twenty feet, with prospects of pay. From claim No. 63 above discovery, to No. 67, the ground, averages \$12 per day to the hand, but above the ground increases in depth. On the 13th of October bed-rock was struck on 75 and 84 above. All the ground from 84 to 103 was re-located a few days ago on account of pay supposed to have been struck thirty-seven feet deep on 83. Mike Sullivan and Wm. Holland sold claim No. 63 above, (which is in Forest City) for \$7,000. Louisville is very dull on account of the great influx of Chinamen, they having purchased many claims in the shallow diggings. They offered \$10,000 for the four

claims owned by Lyons, Cooney & Co., Nos. 20, 21, 22 and 23 below. No. 19 sold for \$1,400 a short time since. There are now but nine companies of white men between Louisville and the Junction, seven miles.

Mining Stocks.

SAN FRANCISCO, THURSDAY EVE., NOV. 10.

The share market has been quite active in certain descriptions and moderately steady. Chollar-Potosi was quoted at 76 a week ago and to-day at 75, but on Tuesday and Wednesday it advanced up to 84 and 85 with brisk sales. Crown Point has been dull after reaching 3 3/4 on Friday, when quite a number of sales were made and since when it has steadily decreased to 2 3/4. Golden Chariot has been quite brisk, and has fluctuated from 68 to 60. The company reports having received \$78,884 on October account. Gould and Curry has also fluctuated considerably, reaching 94 on Saturday and to-day selling at 76.

Meadow Valley has made some large sales. It paid this week its first dividend, \$1 per share, amounting to \$60,000. The receipts for October exceed \$150,000, and the prospects of the company are reported as excellent. The Ophir has been exceedingly brisk during the week and has fluctuated between 3 and 4 1/4. On the 8th an assessment was levied of \$2 per share, delinquent December 13th.

The great demand in the market this week has been for Ophir, Original Hidden Treasure, Savage and Yellow Jacket. Original Hidden Treasure has gradually ascended, and the other two have descended in price. During the month of October, the Sierra Nevada Co. crushed 1,400 tons of ore, yielding \$21,076.

The following dividends were paid to-day: Chollar-Potosi, \$112,000; Hale & Norcross, \$4,000; North Star, \$4,500; Sierra Nevada, \$7,500. A meeting will be held December 8th to consider a proposition to increase the capital stock of the Hope Gravel Co. to \$600,000.

North Star G. M. Co.

During the past year the North Star reports having extracted over 7,800 tons of ore, yielding an average of \$21.37 per ton. Of the total receipts (amounting in all to \$176,000) \$6,000 have been paid in dividends, the rest for current expenses and liabilities carried over from the previous year. The company has paid in all five dividends before this last,—three of \$5 per share, in June, July and August, 1868, and two of \$1 per share in May and June of this year. The Bulletin has the following comments:

A comparison of the working of this mine with that of the Eureka (another Grass Valley claim) shows that there is room for improvement on the part of the North Star management, satisfactory as that management may have been thus far. During the past fiscal year the Eureka took out nearly 20,000 tons of ore, averaging \$31.75 per ton, the total receipts being \$632,000, of which \$400,000 was paid in dividends to stockholders. In other words, the stockholders of the Eureka received nearly 60 per cent. of the receipts for the year, while the North Star stockholders received less than 3 1/2 per cent. of the annual income. Of course, the payment of nearly \$15,000 for debts incurred during the previous year, and \$18,000 for dead work and improvements, had something to do with this small percentage of returns. But there is another and more important reason for this discrepancy. The secret lies in the expense of working the ores. At the Eureka mine, the ore turned out averaged \$31.75, against \$21.37 at the North Star. The average cost of mining the ore at the Eureka was \$8.32, and of milling, \$1.84, or combined, \$10.16, against \$16.73 at the North Star. Here we have a difference of \$6.57 per ton in the cost of producing bullion between the two mines. On the quantity of ore crushed at the North Star, this difference alone amounts to over \$50,000. At the Eureka mine, the net profit on the ore manipulated was \$21.59 per ton, aggregating nearly \$435,000. At the North Star the net profit was \$4.64, aggregating a little over \$36,000. The real difference in the average net profit is \$16.95, of which \$10.38 is due to the increased value of the ore and \$6.57 to the lessened cost of converting the same into bullion.

THIRTY-SIX pieces of Folsom granite, weighing 20 tons, were shipped over the Central Pacific on Saturday, to be used in the construction of the University.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

PACIFIC FILE WORKS Co.—Nov. 1. Capital Stock, \$150,000 in 1,500 shares. Trustees: T. Nelson, C. J. Pillsbury, J. Linforth, J. G. Thwing and G. W. Shanklin.

S. F. STARCH WORKS Co.—Nov. 2. Capital Stock, \$150,000 in 1,500 shares. Trustees: I. Blaisome, E. F. Clarke, J. W. Livery, E. W. Haines and W. Gray.

The following have been recorded in the Secretary of State's Office, Sacramento.

ANAHEIM R. R. Co.—Oct. 28. Capital Stock, \$140,000 in 1,400 shares. Directors: C. R. Johnson, M. Strobel, G. Fischer, H. Kronger and F. Jorehol.

COULTERVILLE AND YOSEMITE TURNPIKE Co.—Oct. 29. Capital Stock, \$20,000.

FIRST-STREET HORSE RAILROAD Co.—Nov. 7. Capital Stock, \$200,000. Directors: C. Martin, A. L. Boggs, P. DeSaisset, M. Schroder, E. F. Spence, A. E. Pomeroy and J. McLellan.

GRASS VALLEY TUNNEL AND M. Co.—Capital Stock, \$600,000 in 12,000 shares. Trustees: G. C. Ling (President), S. M. Harris (Treasurer), C. W. Hayd, W. Chollar and J. W. Lockwood, J. Webber, Secretary; J. Noel, Superintendent.

ENTERPRISE GRAVEL M. Co., Grass Valley.—Capital Stock \$200,000 in 2,000 shares. Trustees: A. E. Davis, T. Shea and M. M. Horam.

Mining Shareholders' Directory—Meetings, Assessments and Dividends.

*Advised in this journal

THE PLUG UGLY Co., Dutch Flat, Placer county, have been making preparations on a large scale for opening their hydraulic workings during the approaching season. They have had constructed, by R. Hoskin of Dutch Flat, 6,300 feet of iron pipe, varying from 30 inches in diameter down to 11 inches, as it approaches the diggings, and made of No. 16 and 18 iron (about 1-18 to 1-16 inch in thickness). They have a pressure of 285 feet and will use two of Hoskin's "Dictator" joints. The supply and the demand for water in this locality will be increased this season, showing a decided improvement in mining prospects. The Plug Ugly company expect to use 500 inches day and night.

THE BOLD ROBBERIES of the overland trains have taken everybody by surprise. Similar operations have been carried out on various stage lines, and these are but culminations. The Central Pacific now keys the bolts connecting the cars on its express trains, rendering such attempts more difficult.

ROASTING OF GOLD AND SILVER ORES and the extraction of their respective metals without quicksilver; by G. Kustel, mining engineer and metallurgist. Contains 142 pages embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit by an author whose reputation is unsurpassed in his speciality. Price \$2.50 coin or \$3 currency. Published and sold by Dewey & Co., Scientific Press Office, San Francisco, 1870.

THE CONCENTRATION OF ORES (of all kinds,) including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, by Guido Kustel, with 120 lithographic diagrams. Published and sold by Dewey & Co., Scientific Press, San Francisco, 1868. Price, postage paid, \$7.50, in gold or its equivalent. The best treatise published.

What it Costs to Commence Farming.

There are so many conditions involved in the above proposition that it is difficult to give a solution that shall be at all satisfactory to any one of the hundreds or thousands who are interested therein. A satisfactory answer would require a knowledge of the particular location, amount and character of the land to be cultivated, extent and description of the crops to be raised, number of family of the proposer, his style of living, habits of industry, etc., etc. The "Cost to Commence Farming" may range all the way from nothing up to many thousands of dollars.

To put the worst face upon it, if you are a single man, altogether "inexperienced," and entirely without money, you may nevertheless commence farming immediately, by going directly into the country and hiring out to the best farmer you can find, and remaining in his employ until you have gained experience and accumulated sufficient money to get a small start yourself. If your employer, as will probably be the case, cannot give you constant work, he can at least furnish you with a little piece of land on which you can spend your leisure days, and such labor will probably result in more profit than that devoted to the service of your employer. The crops which you then cultivate should of course be those whose periods of care will come between the intervals of service required by your employer.

The prairies of Illinois and Indiana are dotted over with thousands of farms whose proprietors, now wealthy and prosperous, made their start in life as hired laborers, and in just the way here pointed out. The more early of them went out upon the prairies, took up government land, built a little cabin or shelter of some kind, worked a part of the time for the older settlers, and thus secured present support and earned the means to fence in their own land, set out orchards and start herds from small beginnings, which grew and increased while they labored elsewhere. Later emigrants hired out in the same way, and earned the means to buy improved lands.

Of course a person whose circumstances require the adoption of such a method must exercise patience and perseverance, and practice the most rigid economy. The world has little mercy on those thus situated who lack the necessary willingness to "go slow" in laying the foundation of their fortune. Although the advance of such must of necessity be slow, no towering pile of brick and mortar rises more surely, steadily or firmly upon its foundations, than does the fortune of one who will thus deliberately choose his calling, study it faithfully, stick to it perseveringly, work hard, exercise good common sense, cultivate intelligently, and always keep within his means. There is no such thing as failing in such an enterprise, so conducted—if health and life is spared. We do not believe there is a young man of fair intelligence in the entire State who cannot, by following out the above advice, accumulate a comfortable fortune inside of twenty years by the direct results of his industry and the advance in the property which he may thus gradually acquire; and have the wherewith to spare, in the meantime, to gather around him and support a little family, which shall grow up to bless and care for him while he travels the down-hill of life.

To start in any kind of business, without money, is not pleasant; but it is a necessity to which most young men are brought, and, as a general thing, takes one through a course of schooling, which, in after life, more than makes amends for the inconveniences and irksomeness of the probation. It builds up, develops and establishes character. One who boldly strikes out in such a course, never lacks for friends, and

if he needs and seeks employment he will always find it.

We need not go as far as Illinois or Indiana to find proof of what we have written. The living evidences are all around us, and may be found in every agricultural county in the State.

The Marysville *Appeal*, in refuting the oft repeated assertion, lately taken up by the *Examiner* of this city, that poor men cannot take up lands in this State and get a start upon them as farmers, says, in substance: There is always a field for laborers throughout this section, either in harvesting, planting, wood-cutting or some other pursuit. A man without a dollar in the world takes up a quarter section and pays the first fee of \$10 or \$15 in currency, out of his first week's or first month's wages. He puts up a little shanty, at a cost of \$20 or \$100, according to means and taste, where he sleeps at night and works for neighbors by day. When no employment offers he puts in some wheat, beans or vegetables; and cultivates at his leisure. Gradually a few chickens, a couple of pigs, a cow [and we would add a few sheep] are

VIEW OF THE PROPER MOVEMENT OF A FURROW SLICE.

obtained, whose proceeds and increase come for him while he sleeps or works for himself or others. His stock increases, his harvests mature. He sells his butter, cheese, eggs, crops, etc., and lays money up to pay for his land, buy clothing, add to his stock, etc.

The *Appeal* adds: "If the *Examiner* editor could see the sun-browned yeomanry coming to the Land Office every day, with their rolls of greenbacks to pay for lands taken up the year before, *by men without means*, we scarcely believe he would continue to discourage such enterprise, or advise needy workmen to remain in overcrowded cities. Come out of the city, you working men. Shake its dust from your feet. Come into the foot hills, the valleys and the plains. Leave those places where you say you are crushed under the heels of capital. Stand upon your own soil and be independent of the world. Capital can not drive you from that, it cannot control the moisture that nourishes your crops, the bright sun that ripens them or the fire on your hearth; while the low sweet music of your rustling grain will be an inspiring anthem of liberty and independence."

Having demonstrated how a poor man, without either experience or money, may commence farming, we will next week endeavor to show how much it will cost a man of means to commence in the regular way, from the start; and as we proceed we will do the best we can to answer, in full, each particular question of our last week's correspondent, who signed himself "A Constant Reader of the Press." In the mean time we cordially invite suggestions or objections from correspondents.

THE CEREALS IN OREGON.—The Dalles *Mountaineer* says that the good quality of Oregon cereals, has at length attracted the attention of the Department of Agriculture at Washington, and an order for one hundred bushels of the best Winter Wheat, has been received by Messrs. Everding & Beebe, of that city, which has been shipped. The sample will probably be distributed among the prominent agriculturists of the various wheat growing States.

Correct Plowing.—A New Plowshare.

Plowing is an operation variously modified according to the objects sought to be obtained, as in breaking new ground, in covering manure, in cultivating or destroying weeds, in making soil, etc. The kind of plowing, however, to which we desire to call attention, at this time, is designed for "making soil," or putting the ground in the best condition for aeration and receiving seed without manuring. Farmers are well aware that this operation involves the turning of the soil in such a manner as to expose the largest amount of surface to the action of the atmosphere.

In our issue of Sept. 4th, 1869, we published an article on this subject, from the pen of Mr. L. Begou, of Sacramento, in connection with which a diagram was given wherein it was demonstrated that there was only one proportion between the width and depth of the furrow slice, which would accomplish this object in its greatest perfection; all variations from which reduced the surface of the ground exposed to the atmosphere below the attainable standard. That proportion was as 10 is to 14. That is, in correct plowing, if we decide upon a depth of 10 inches, the width must not be taken at random, but must be fixed at 14 inches exactly; or if the depth decided upon is 7 inches, the width of the furrow should be 9.8 inches; and moreover, that the furrows should be placed in precisely the position shown in the accompanying engraving, a feat which will be found very difficult of accomplishment by any of the plows now in use.

We do not propose, at this time, to repeat that demonstration, although we may do so on some future occasion. Our present purpose is simply to state that our correspondent, Mr. Begou, after much research and experiment, has succeeded in devising a plow, which, to all appearances, accomplishes the work desired, and that too, at the least expense of power for draught. In the claims for which he asks protection at the Patent office, he sets forth that his "invention relates to an improved manner of constructing the mold board of plows, in order that they shall meet with the least resistance possible while passing through the ground, and to more perfectly adapt them for turning the soil, and leaving it in a proper position for being acted upon by atmospheric influences."

The accompanying engraving, which has been especially prepared for this demonstration, is a correct representation of the work which this plow will do. The letters *i, k* and *l, m* represent two furrow slices which have already been turned over, while *c, d* represents a furrow in the process of being turned, but from which the plow has been removed; *e, f* represents the edge of the land from which the slice is being removed; *a, b* the edge as cut by the preceding furrow and *g, h, g, h* the sole of the furrows.

A careful consideration of the figure will also show that the extension of the slice, in process of removal, takes place along the land-edge, *c, d*, only from *c* to where the backward flexure is given to it, when rising on the mold-board, and where it is again restored to its original form, by the rear portion of the mold-board correctly placing it in its true position, instead of leaving that duty to the accident of its being uprightly poised or just sufficiently inclined to be brought to its proper position by gravitation or the thrust of the plowman's foot.

By the proportions given, of 10 to 14, the furrow faces are inclined to the exact au-

gle of 45°, the importance of which is fully understood by every person thoroughly versed in the art and theory of plowing; while any deviation from that proportion changes this angle, and necessarily causes faulty plowing. We propose at some future time, to go more thoroughly and fully into the principles of plowing, which are merely hinted at in this article, and illustrate the same with suitable diagrams. In the mean time we would call especial attention of plow manufacturers and dealers to the invention of Mr. Begou, whose principle may be applied to nearly all the various plow devices now in use.

CALIFORNIA FRUIT AT ST. LOUIS.—The exhibition of fruit formed the chief attraction in the pomological department of the late St. Louis Agricultural Fair. It is spoken of as having been truly magnificent in size, beauty and color. The show consisted chiefly of pears, quinces and grapes. The pears are said to have averaged about twice the size of the same varieties when grown in Missouri or Illinois.

NEBRASKA VS. CALIFORNIA.—The Nebraska folks are talking about a machine recently invented by a citizen of that State which carries two men who do the hinding as fast as the machine cuts and gathers in the wheat. It may be news to our Nebraska neighbors that a Californian has invented a machine, which harvests, threshes and sacks the wheat, so that all that has to be done is to remove, close up and drop the sacks of grain upon the ground as the machine progresses; just as the Nebraska men drop their sheaves.

POTATO BUGS CROSSING LAKE MICHIGAN.—The St. Joseph (Michigan) *Herald* says that immense numbers of the Colorado potato beetle were recently found on the eastern shores of Lake Michigan—many dead, some living—which must have crossed the Lake from its western shore. A vessel's deck, in the midst of the lake was also, about the same time, covered with great numbers of this insect, which must have flown from the shore.

POTATOES AND GRAIN.—The East Pennsylvania Experimental Farm, located in Chester county, has raised, the present season, 150 varieties of potatoes, between 30 and 40 varieties of wheat, and 30 varieties of oats.

THE POTATOE ROT.—The microscope reveals the fact that a speck of potato-rot the size of a pin contains two hundred ferocious little animals, biting and clawing each other savagely.

Household Reading.

The Philosophy of Eating.

The human body is a kind of furnace, or perhaps, more properly, a chemical laboratory designed for certain specified work. The food which is taken into the system, to be there elaborated for its sustenance, consists mainly of two kinds—carbonaceous from which heat and fat is produced, and nitrogenous, which goes to make the bones and muscles or red meat of the system. The first, or carbonaceous is composed principally of starch and sugar, which constitutes about 65 per cent. of wheat, 45 per cent. of corn, 20 per cent. of potatoes and an average of about 35 per cent. of meat, (veal containing only 17 per cent. and pork 50; beef and mutton being intermediate.) The second or nitrogenous consists chiefly of gluten and albumen, which constitutes about 15 per cent. of wheat, 8 per cent. of corn, 13 per cent. of meats and less than 2 per cent. of potatoes. In addition to the carbonates and nitrates phosphorus and lime is also needed to keep up the waste of bone and brain. This waste which is very small, is made up from the mineral portions of whatever we eat, (from two to six per cent. of the bulk) and is found in greatest abundance in the outer covering of grain and in fish and meat.

When food is taken into the stomach it undergoes a change which is called digestion, during which sugar is largely formed from the carbonaceous portion and in that form is first appropriated to keeping up the animal heat, the supply being deposited as fat. The nitrogenous and mineral portions after being properly elaborated go to the building up of the muscle and bone. Whatever remains over and above the necessities for such supplies, or is unfitted for them, is voided as waste. Every part of the food goes to its proper destination. If the fat producing elements are wanting, those parts suffer; if the muscle producing elements are not present, the muscle must go unprovided for; as no one kind of food can by any art be made to take the place of another. Hence *variety* is just as necessary to sustain life as quantity. Unbolted wheat flour is the only kind of food which contains all the constituents necessary to sustain life. Hence a person who uses such flour may do without meat; but one who uses white flour must have meat or its equivalent.

The supply of *animal heat* is the first and chief requisite to life, and about three-quarters of all the solid food taken into the stomach is appropriated in keeping up this supply. This heat is mainly generated in the lungs by the action of the air upon the blood. When the blood enters the lungs it is loaded with particles of carbon which are brought into such intimate connection with the oxygen of the air inhaled, that a chemical union takes place between the carbon and oxygen, forming carbonic acid gas. This union is so rapid that a notable quantity of heat is developed, which is carried by the out going blood into every part of the system. Every one knows how rapidly any part of the system becomes cold when the circulation of the blood is slow or weak.

It is from the heat producing action mentioned that the lungs have sometimes been likened to a furnace. Indeed the action is very much like that of burning wood or coal. But the food which we eat is not directly consumed. After digestion, it is taken up by the red or arterial blood, and carried to every part of the body to do its office of building up the system—is deposited as fat, or muscle, which by the incessant activity of the system, is constantly being wasted or used up, or changed into useless particles of carbon, which must then be got rid of. The blood takes up these particles of carbon and carries them to the lungs where they become the fuel necessary

to keep up the heat of the system, the unconsumable gases passing off through the mouth or nose, as through a chimney from a furnace. This reciprocity of activity and waste, is constantly going on in every living organization. We cannot breathe or wink, or move a finger, without a corresponding waste of tissue, (fat or muscle.) Thus food forms tissue, and tissue is wasted by activity. Hence the more active we are, the more food we need to repair the waste of activity.

How to Prepare Salad.

All are fond of good salad. It has been used from the days of the ancient Romans to the present time, and in almost every country it is composed of nearly the same ingredients, which are well known and generally quite uniform; but the correct mode of preparation is not so well understood. Mr. Septimus Piesse makes some remarks upon this dish and gives a formula for its preparation, which we would commend to the attention of all housewives:—In spring and summer, lettuce, mustard, watercress, and radishes form the staple; in autumn, endive and cabbage lettuce predominate. Nothing spoils a salad so much, both in appearance and flavor, as cutting it up too fine. Every atom should maintain its individuality. Radishes cannot be cut too fine, but the slices should be cut in rings, and not dice shape. Onions must remain a matter of taste; but not so as regards mint. Every salad should contain from three to six leaves of young mint, as it greatly assists its digestion. No salad can be properly made without one or two hard-boiled eggs, because the yolks are necessary to blend the oil. The mixture should be made thus: Boil two eggs quite hard; when done take them out of the saucepan and put them into cold water. This causes the eggs to shrink, and the shells can easily be removed without disfiguring the white. Cut each egg into three parts, and remove the yolk into the salad-bowl; cut the white into fine rings, some of the best of which should be preserved to place on the top of the salad when served. With a wood or silver spoon break up the yolk in the salad-bowl, and add one teaspoonful of oil; these ingredients rub together, and they will blend; then add at least three teaspoonfuls more of oil, and again rub altogether; now add a teaspoonful of moist sugar, again rub, and all will blend. Now add gradually, a little at a time, the vinegar, in quantity about twice as much as the oil used; lastly, put in pepper, salt, and ready-mixed mustard, the latter but little; but on no account use mustard that has not been previously mixed with water.

It is very essential to mix the ingredients in the order laid down as above. When this is carefully done, an excellent salad will be the result—soft, yet aromatic; creamy, but not greasy. There are true chemical reasons for mixing yolk of egg with oil, as there are for mixing flour-of-mustard with water, and not vinegar; but this is not the place for examining them—the facts stated must be accepted. It is the general want of the knowledge of how to blend the oil that causes the common remark: 'I am very fond of salad, but I'll not take any oil, thank you.' Of course, served up as it frequently is, all floating and greasy, few things can be more objectionable.

The old fashioned spinning wheels are still much used in the up-river counties of Maine, and a large wholesale business is done in these articles in Bangor. It would be better on many accounts if both the wheel and loom were to find their way once more into a large number of dwellings, in all parts of the country.

THE RICHEST MILK—Once a Week has the following:—"Everybody knows the value of milk as liquid food for the young and weak; but everybody does not know that of all milks, that from the sow is the richest and most nutritious. It contains fifty per cent more solid constituents, such as butter, cheesy matter and sugar, than does the lactiferous produce of the cow. This is shown in a recent analysis by Professor Cameron, of Dublin."

A NEW USE FOR OLD BOOTS.—Excellent jelly or glue is now said to be made out of old boots. At a recent meeting of the Liberal Club, Prof. Van de Weyde demonstrated the feasibility of such a transaction. The leather being treated with lime, under increased atmospheric pressure, parts with its tannin and reverts to the condition of gelatin, when it may be converted either into glue or cast in a mould for edible or ornamental purposes. Think of boiled boots as a light diet!

Mechanical Items.

WATCH KEYS.—Unsuitable watch keys and careless winding injure watches more than is generally supposed. If a key slips, the entire "works" receive a shock, which cannot fail to work a permanent injury. Hence watch keys should fit perfectly. In winding, insert the key firmly and turn the key—not the watch. A brass key is best, a soft steel pipe next, while a hard steel pipe should never be used.

LUBRICATING OIL.—The Central Pacific Railroad Co. are manufacturing their own lubricating oil from the crude petroleum of San Buenaventura.

THE LARGEST PANE OF GLASS ever set up, as it is claimed, has just been placed in position in a window in New York. It is seventeen feet high and ten feet wide.

TWO-STORY RAILROAD CARS.—The French appear to be getting somewhat elevated in their notions. They are experimenting with two-story railway cars and balloon mail transportation.

A SIMPLE MOLD FOR BEESWAX.—Wrap any smooth paper about a round stick, and pour the melted wax into the mould. When cold, tear off the paper, and you have a smooth, nice stick of wax, to be cut into any desired lengths.

CHEAP AND EFFECTUAL WINDOW FASTENER.—As villains will find their way into houses without window fastenings, we would suggest a simple and almost costless window fastener. Take a few inches of wire and bend at one end a ring to attach a string to, to hang to the sash or window frame; with a gimlet make a few holes to insert the wires in the sash and frame at such places as will allow the sash to be fastened whether closed, or down for ventilation.

Household Receipts.

AROMATIC BLACKBERRY SYRUP.—Take of blackberry juice 2 pints; sugar, 1 lb; grated nutmegs, No. 6; powdered cinnamon, ½ oz.; powdered cloves ¼ oz.; powdered allspice ¼ oz.; brandy 1 pint. Steep the spices in the brandy 48 hours; filter, and after making a syrup of the juice and sugar, add to it the syrup, when it will be ready for use. Dose for an adult, one tablespoonful; for a child, one teaspoonful as required.

HOW TO PRESERVE FRUIT.—E. A. Davis, of Santa Clara, sends the following:—"As it is fruit time, perhaps it would be well to inform your readers that shellack varnish, put on to apples or pears, (two or three coats) will preserve them twelve months. My plan is to put the varnish on with a brush and hang them up by the stem, this is not a slow job after one gets the hang of it; but dipping them in the varnish is a much faster way of doing it; fruit prepared in this way will keep the same colors when varnished. The varnish will not injure the fruit in the least."

We have seen *apples* keep so prepared for twelve months, which would have decayed, under ordinary circumstances, in three. We see no reason why pears may not also be kept as long. Eggs may be kept in a similar way. The secret consists in keeping the juices of the fruit or eggs completely isolated from the action of the atmosphere.

A HINT IN CANNING FRUIT.—A lady correspondent writes that in canning fruits she always cuts thick writing paper in round pieces, the size of the tops of the cans, and just before sealing, slips a piece in upon the top of the fruit, and pours a little boiling juice over it. The paper so placed keeps the fruit from mouldering on the top, a circumstance which sometimes occurs without injuring the flavor of the fruit, if the mould is carefully taken off immediately after opening. The paper will also act as a trap to collect and hold the sealing wax, if any drops into the can while opening or closing it up.

WHITENING YELLOW FLANNEL.—Flannel which has become yellow with use may be whitened by putting it for some time in a solution of hard soap, to which strong ammonia has been added. The proportions are one and a half pounds of hard soap, fifty pounds of soft water, and two-thirds of a pound of strong ammonia. The same object may be attained in a shorter time by placing the garments for a quarter of an hour in a weak solution of bisulphate of soda to which a little hydrochloric acid has been added.

Life Thoughts.

VIRTUE shines, though contemptibly clad and is recognized and respected by noble minds.

GREAT difficulties, when manfully met, bring out great virtues.

He who can suppress a moment's anger, may prevent days of sorrow.

A man should think little of the evil that is said of him, unless he thinks much of him who says it.

A HAPPY life is made up of happy thoughts, and a man should be a very miser in hoarding conscientiously every mill of the treasure.

HOW TO TREAT AN ENEMY.—If you have an enemy, act kindly towards him and make him your friend. You may not win him at once, but try again. Let one kindness be followed by another, until you have accomplished your object.

HOPE is the last thing that dies in a man, and although it may often deceive us in the journey of life, yet it conducts us along an easier and more pleasant path to our journey's end.

KIND WORDS AND ACTS should be freely given and rendered; for such are fragrant gifts, whose perfume will gladden the heart and sweeten the life of all who hear or receive them.

PRIDE.—Spencer speaking of pride very aptly says that only a little wind is required to expand a bladder to great size, when if a few beans be put in and shaken, the noise will frighten an army; but only a pin is required to reduce it to insignificance.

TO LEARN A MAN'S CHARACTER.—If you wish to know a man's character, wait till some misfortune or disgrace happens to him, and you will soon see all his greatness or all his weakness.

A Thought.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

When we stand beneath the shadow of a principle we often feel an enthusiasm that blinds us with an assurance that we are possessed of or acting from the principle itself; but we often fail, and the delusion still lingers, that our mind holds the principle upon which the action was based; and we wonder at the failure, instead of investigating, analyzing, and with steady aim, moving onward, until the limmering shadow passes over us, and we stand firm on the rock of the principle—the *knowledge* of it, instead of the *faith*. Then our enthusiasm changes into a grand and sublime veneration of law, and the customs and trammels of past ages cannot reach us, or erwee us from our post. We are beyond the confines of fear and all earthly dissolutions, leading or bearing, upon this one great truth that has exalted us.

Our enthusiasm oftentimes holds us in the shadow until we reach the reality; but possibilities, and conditions will not insure steadfastness, until we reach the rock, of knowledge. When we do, the waves may flow and dash, but no mortal bearings can reach our standard. High above earth's billows, we stand in tranquility and gaze on cause and effect, blendings and changes, along the path to a truth.

Why should the mind act with the confidence of knowledge, while passing through the shadow of it; and waken only at the portal, to the delusion that has held, and strengthened it onward by the faith, and hope of a possession?

The shadow contains elementary emanations from the principle.

One component part after another, must have successive growths in the mind, until we reach a crowning element that culminates, and leads the mind out to an immortal truth. The illumined soul then basks mid the sunshine of eternity, beyond the bounds of earth's domains; and life's standpoint, in one direction at least, gives us glimpses of unerring laws, that suggest to the mind, the possibilities of this life. Heaven is not far off then, and the soul is inspired to go forward and gather from the inexhaustible founts, knowing that the path will widen and transcend continually.

Until the mind deals with principles, its creations are unreliable in themselves unless viewed and dealt with as complements of an undeveloped principle.

NELLIE W. HUTCHINSON.

Gold and Legal Tender Rates.

San Francisco, Thursday, Nov. 10, 1870.—Legal Tenders buying @91; selling @91½. Gold in New York to-day 110½.

Notices to Correspondents.

THE communications of which we spoke last week are unavoidably postponed until the next issue by press of matter.

Resigned.

We see that Col. Fisher, who has filled the position of Commissioner of Patents for the last year or two in a most acceptable manner, has just resigned his position. What his reasons were for this action, we do not know. We have always understood that exceedingly little fault (there always will be some) has been found with the Commissioner, and can only suspect that there may be some political grounds somehow connected with the resignation.

We ought to confess that this suspicion is founded on general principles. The accursed system of "rotation in office," no matter what that office may be, has worked a tremendous injury to our country. We believe strongly in an improved civil service system, founded on principles similar to those included in Mr. Jenckes' bill, which has been so wrongly ignored by Congress. We believe that in such departments as that of the Patent Office, for instance, politics should be kept entirely aloof, and that there should be inducements held out for well qualified persons to enter and remain in such places, with the certainty that they can, in time, obtain high positions. Thua we should always have good men in important offices of trust, while with the present system we must call ourselves simply "lucky" to have as many as we do.

It is stated that William Bakewell, of Pittsburgh, will succeed Col. Fisher. We are not acquainted with Mr. Bakewell but are willing to believe that he may be excellently well qualified for the position. But by our plan, the next in office would succeed to the Commissionership, and people would then have the certainty that that office would be held by one who had had long experience in its duties, to say the least.

The Thompson Road Steamer.

After all that has been said concerning this machine here and elsewhere, we were a little surprised to find a morning paper commenting on it as if the paper had just discovered its existence. For not only have California (and other) papers discussed the subject and given results of practical experiments, but a California association, the Tide Land Reclamation company, has now, and has had for several weeks, one of these very locomotives in this city, lying in a bonded warehouse.

Although we have spoken frequently concerning the steamer, a brief description may be of interest under the present circumstances. There is a vertical pot boiler (with water tank, etc.) hung between two driving wheels, 5 feet in diameter, with a steering wheel 3 feet in diameter, in front, over which is the seat for the engineer. The engine is very neatly and compactly constructed, with two jacketed cylinders, 12x6 inches, and cog-work connecting with a gear wheel on each of the driving wheels. It is claimed, but the claim seems too large, that 28-horse power can be obtained by the construction. The whole arrangement would seem to be some 13 feet long and as wide as an ordinary truck. The gear wheels, cylinders and the like are protected from dirt, etc.

The three wheels are all made alike and differ only in size, as stated above. They are the great and important feature of the engine. They are light drums of boiler iron with rubber tires, four inches thick and twelve inches wide, which are made a little smaller than the wheel and hence clasp it tightly. A flange on each side, moreover, keeps them from slipping off. They are made of gutta-percha combined with antimony. They are capped or protected from the wear of the road by a steel chain or reticulation of bars (about 1 to 1½ inches apart, 3 inches wide and ½ inch thick, and with ends bent up on each side of the rubber) hinged so that they yield when the tire yields, and spring out of the rubber when the pressure on them is released. When running (without a load) a pressure of three tons (the whole weight is six tons) on each wheel at the point of contact with the ground flattens out the rubber so that there is a pressing surface said to be nearly a foot wide. With a load this surface is increased.

Together with the engine comes a gang of eight plows. The mold-boards are very long in comparison with those generally used here. The price of the whole we have heard stated at about \$10,000. Elsewhere we have seen the price of the engine given as \$5,000.

The New York Farmers' Club lately sent a committee of four gentlemen to witness plowing and traction with this machine at Patterson, N. J. They all concurred in recommending the engine for use about foundries, ship yards, mines, quarries, etc. And with the exception of Prof. Whitney, (of the *Am. Artizan*) they concurred in the opinion that with some alterations and simplification it was to be recommended to the farmer. The performance we saw shows, they say, in our opinion that we have offered to American farmers, a motive power that can pull as hard as 14 horses, and on a uniform surface can so continue for a day to move and plow seven furrows a foot wide and eight inches deep. We recommend this machine, or such modification of it as we have described, to the attention and fostering interest of American farmers and engineers; for we believe that in this direction lies the strength of the tillage that is to be, and the chief material victory that is to enrich the next generation.

A TIME CHANGE has occurred in the running of the Oakland and Alameda routes of the C. P. R. R. See advertisement.

The State University.

The Board of Regents held a meeting last week and transacted considerable business on matters pertaining to the Fifth Class (now numbering between 80 and 90 students), the Board of medical examiners, outside University property, the abolition of the Professorship of Chemistry, Mining and Metallurgy, etc. Prof. George Davidson, chief of the Pacific Division of the U. S. Coast Survey, was elected Prof. of Astronomy and Geodesy, that professorship being created but no salary attached to it. On account of the election of President of the University, the executive committee was abolished.

A communication was received from Prof. Fisher in regard to the abolition of his chair. In reply, a resolution was passed to the effect that no charges have been made against that gentleman. But a motion to reconsider the vote abolishing the chair, was lost by a strong vote, only two declaring on the affirmative side.

The matter now stands thus: One of the most important professorships in the University, held by a professor against whom all charges are expressly disclaimed, is abolished for no given reason, except the inadmissible one of economy, and part of its duties given to another chair on which now devolves an amount of work impossible to be done by one man.

In regard to mining and metallurgy, which might be thought important in our State if anywhere, we say nothing at present. But chemistry, certainly, is absolutely indispensable in each of the five colleges which compose the University. And that Prof. Carr, with his lectures in this city and in the various sections of the State and his instruction in his own wide department, can give the proper amount of attention to it, is plainly impossible. All institutions of any standing have a separate professor and one or more assistants for this one subject. It must follow that an assistant be appointed here, and we strongly suspect that when a man satisfactory to the Board is found, the office of assistant will be elevated to the dignity of professorship.

If there are any hidden reasons, unknown to the public, which can justify the action of the Board, which can explain its mode of action, dismissing an important professor without charges, without previous intimation and without subsequent notification—we are fully ready, and shall only be too glad, to inform our readers of further facts in the case. We know that many of the Regents are of the highest reputation; but we have labored in vain thus far to obtain any information which would seem to justify this action of the Board, and we cannot but fear gloomy prospects for what ought to be California's brightest jewel,—the State University.

Preserved Meat.

The packages of meat, which were recently opened at the Melbourne Custom House, and which proved to be offensively worthless, were shipped from England as an experiment of a new process. Had it been Australian meat, it would not have been in the Custom House, which is employed for imports, not exports. The shipment of preserved meat from Victoria to England has become an established business. Thousands of cases and casks of beef and mutton are shipped monthly to London where it finds a ready sale. Mr. Talleman, the agent, experienced much difficulty at first in introducing the meat, but by giving a series of dinners to which he invited many of the most prominent men to partake, and by opening eating houses at which people could obtain a dinner for one penny or two cents, he succeeded in overcoming the prejudices. He

has established agencies in every town and district throughout the country. Test shipments to the East Indies have given satisfaction and orders for more have been given. The success of the Pioneer Company at Melbourne has caused the establishment of several more companies. M.

Academy of Sciences.

The regular meeting of the Academy was held on Monday and was unusually well attended. After the election of members and the presentation of contributions, Dr. Kellogg presented a plant lately found by him near Summit station and at one or two other places on the Sierra Nevada. This is a new species of *Dicentra* which, from its distinguishing characteristic the doctor proposed to designate as *uni-flora*. A specimen of mineralized wood, changed to carbonate of iron, from the Mt. Diablo coal mines was shown. It belongs in the Pioche collection.

Judge Hastings read a paper on earthquakes in which he advanced the theory that the shocks are caused by the caving in of subterranean caverns, this caving in being caused by the action of water. This leads to the conclusion that earthquakes belong to countries of later geological formations, and that as a country grows older the caverns gradually are filled up and the shocks cease. The theory was founded principally on his personal experience. Naturally the subject was discussed, this proposition generally opposed and others advanced. But the President closed the matter by a sensible remarking that we have not yet sufficient facts on which to build a satisfactory theory. In the course of the discussion Prof. Davidson remarked that earthquakes are much more common extensive and severe in Alaska than in Mexico or California and adjacent regions.

The subject led also to the discussion of springs, the rise of rivers, etc., in which Dr. Gibbons referred to his theory advanced several years ago. The matter of evaporation, of closing or opening rents in the ground, etc., was gone over.

Dr. Gibbons gave the result of some interesting observations on the direction of the clouds in the different strata, the harmonic rise and fall, etc., during the first days of this month. Prof. Davidson had investigated to a certain extent the glacial markings on Vancouver and adjacent islands. In regard to their direction, he found the average of 10 grooves, which were from 30 to 40 feet long and one to three feet deep, to be N. 8½° E. true. He had measured Mt. Baker and found it 10,719 feet high; height of snow line in summer, 5,301 feet.

Mr. Hanks brought up the matter of the wreck in the Colorado Desert and thought that the Academy ought to investigate the assertions made and find out whether there actually was such a vessel in the locality claimed, and if so; whether this would not lead to interesting geological data. After considerable discussion as to whether this was a fit subject for the Academy to take up, it was decided to invite Col. Evans, (who claims to have seen the ship) to address the society on the matter at the next meeting.

FORT YUMA AND SAN DIEGO ROAD.—We are glad to see that the Chamber of Commerce of this city appears inclined to co-operate with the Chamber of Commerce of San Diego in relation to the above-mentioned road. The subject is one of considerable importance to the business of San Francisco.

FIFTY TIERCES of El Dorado wine were forwarded on one train this week for Meadville, Penn.

MEDICAL SOCIETY.—The annual meeting of this society was held on Tuesday. Dr. Baul y, U. S. A., delivered the annual address.

Patents and Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING NOVEMBER 1st.

BALING-PRESS.—George Duncan, San Francisco, Cal., assignor to himself and William Blackmore.

CLOTHES-LINE HOOK.—James Garvey and Matthew H. Kimball, San Francisco, Cal.

CLEANSING ATTACHMENT FOR HOES.—Robert R. Spedden and Harrie T. Spedden, Astoria, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

FEED CUTTER.—C. R. Donner, Sonora, Cal. For chopping straw and other fibrous substances to be used principally for feeding horses and cattle, this device has several excellent points which can be more readily appreciated by seeing the machine at work than from the brief description to which our space limits us. The invention consists in placing at the end of a cutting box of the usual form, a balance wheel which revolves on a shaft running parallel to the sides of the box. The knife which cuts the straw or other substance, is attached to one of the arms of the balance wheel and is carried around with it, cutting the straw between the knife and the square cutting edge of a metal plate attached to the bottom of the box. The straw passes under a roller in the box, and is fed to the knives by teeth, which, by a peculiar mechanism, are caused to move it forward at each revolution of the balance wheel and bring it under the knife. By this construction the cutting box is made self-feeding, it being necessary only to place the straw in the box and to turn the wheel. The knife requires sharpening very seldom, as its contact with the steel plate on the box will tend to keep it in good condition.

GRAIN SEPARATOR.—A. Duus, S. F. This is another invention called forth by the ever increasing demand for good agricultural machinery on our coast. In fact, the number of devices invented for the benefit of our farming interests is one indication of the growing prosperity of our farmers. And this invention is one applicable to a very important point, the freeing of wheat from chaff, barley, cheat, mustard, etc. It consists of an arrangement of screens, in a suitable frame, in such a manner that the straw and chaff will be thrown off from the upper screen by a fan blower; the barley will be caught by another lower screen and conveyed by its inclination and motion to the proper point; the wheat will be arrested in a similar manner by a third screen; and the smaller grains, like mustard, will be saved by a fourth and last screen. An important feature is the novel device by which each screen or set of screens receives the proper motion best adapted for facilitating the separating process.

VALVE-GEAR FOR ENGINES.—T. Hill, Vallejo, Cal. This is one of the last inventions of Mr. Hill, who has done so much in the way of improving the construction of various parts of the steam engine. It is a device which renders it possible to dispense with a portion of the mechanism hitherto found indispensable. It is intended to apply more especially to double oscillating marine engines, and by its use only one link and two eccentrics are necessary to reverse both engines; and by a slight modification only one eccentric will be needed. It is likewise applicable to

other than marine engines and especially to locomotives. As we hope to illustrate this ingenious device hereafter, it will not be necessary to enter into details at present.

TRUNNION FOR STEAM ENGINES AND CALENDERS.—T. Hill, Vallejo, Cal. In this class of machinery, the steam is passed through some form of steam tight joint to the engine or calender, as the case may be. In the first case, the movement of the supporting trunnions is vibratory, and in the calender they revolve continuously; but in both they soon become warm and must eventually be replaced. To lessen the expense and time in such removal, Mr. H. constructs the inner part of the trunnion, in which the joint is made and through which the steam passes, so that an end view shows a cross or star with blunt points which are accurately turned. A sleeve is fitted over these points, and upon the outside of this fall the friction and wear. A further advantage is derived from the circulation of air through the spaces between the points or ends on which the sleeve rests, this keeping the bearing comparatively cool. When too much worn, the sleeve can be replaced in a short time. Illustrations of this and the preceding will shortly be given to the readers of the Press.

WOODS' SAW GUMMING AND SHARPENING MACHINE.

A USEFUL DEVICE.—We hereby illustrate a device which will be found, we think, exceedingly useful to many. It is a collar stud and tie holder, which renders the task of fastening the loop of a "butterfly" tie exceedingly easy, while it prevents the unpleasant liability of losing this article of common wear. The cut shows the construction of the stud. The loop of the tie is slipped into the slot in the bulb and is there held firmly. It is a little thing, but a little thing of considerable importance to a large number of the sterner sex. The studs are durably plated with gold and are very cheap. It is the invention of Mr. W. E. Simonds of Hartford, Conn. Wiester & Co., 17 New Montgomery street, Grand Hotel, will give any further information desired.

THE FIRST POST OFFICE in Victoria was established at Melbourne in 1837: the number of letters was 1,050, of newspapers 1,955. In 1850, the number of letters was 381,658, of newspapers 381,158. In 1860, nearly 10,000,000 letters, 5,000,000 newspapers, and 500,000 packages passed through the Melbourne Post Office; of the letters 8,000,000 were inland, the remainder ship and intercolonial; of the newspapers 2,527,549 were inland, the remainder, British, foreign, ship and intercolonial.

TESTS for the reduction of iron ore from a mine near Shingle Springs are said to have been made with satisfactory results.

New Saw Gumming and Sharpening Machine.

The accompanying engraving represents a new saw gumming and sharpening machine. It was patented about a year ago by S. A. Woods of Boston, by whom it is manufactured. The machine is so very simple in its construction and operation, that a few words only will suffice to make it readily understood.

The working parts are constructed upon a triangular iron frame, upon the top of which is suspended a swing frame, the back end having a driving shaft (forming the hinge) with tight and loose pulleys; from this, power is transmitted to the arbor upon which is secured a Solid Emery Wheel. The arbor on which the saw is placed is so arranged that universal motion is readily obtained, any size of saw or shape of tooth desired. The wheel is held away from the saw by means of a spring, under the swing frame. The frame is pressed down, bringing the wheel in contact with the saw, with one hand, and the saw turned on the

calling on these gentlemen, will have his wants courteously attended to, and can learn any thing desired with regard to the device.

GEORGETOWN TUNNELS.—The Colorado Herald has the following concerning the tunnels around Georgetown, Colorado: The tunnels which have been started within a few miles of this place, would amount, in the aggregate, to hundreds of miles in length. A tunnel site has been located for every five hundred feet between the forks of the creek. Three miles below Georgetown, to the Baker Company's works above, it would be safe to say that five hundred tunnels have been located, and a great many of them sold to eastern capitalists who have commenced operations. A few of these schemes may be called legitimate; that is, the men who organized the companies owned good property and have started their tunnels with a plausible show of ultimately accomplishing something. But it is also true that a large majority are the most barefaced humbugs that have ever been attempted in this country. * * * The serious truth is well understood here, that these tunnel schemes are ruining the country. They must result disastrously to those who buy the stock in nine cases out of ten. They will surely bring ruin on the innocent parties who are gulled by the big stories which are gotten up expressly for the purpose of selling stock, and nothing else. * * * Marshall's tunnel is now over 850 feet long—Barleigh's over 700 feet, I believe, and one or two others have been driven 500 feet, or thereabouts. The hopes of the tunnel fraternity depend on the success of these. It would be better, perhaps, that they all prove failures, if they are to be the means of inducing innocent parties to invest in bogue concerns. The bulk of the capital which has been invested in Clear Creek county this year has been put into Tunnel Companies. The result is, few if any have realized a dollar in dividends from their investments, and a large majority never will. This is a good enough mining district. There is plenty of ore, and it is rich enough to pay handsomely—but if the present reckless and dishonest manner of organizing Companies is continued, it will require ten years for the district to recover from the bad effects which must follow.

PACIFIC COAST SURVEY.—Prof. Pierce, Chief of the U. S. Coast Survey, states that the work now in progress on the Pacific coast comprises the following operations: Determination of the latitude, azimuth, and magnetic elements at three principal stations on the Santa Barbara Channel, coast of California, and difference of longitude between San Francisco and the light house on Point Arena; coast topography between Santa Barbara and Point Conception, and between San Pedro and Point Dumas; special examination of the tides and currents of San Francisco Bay; azimuth, triangulation and topography in the vicinity of Point Arena; reconnaissance and topography of Humboldt Bay, and special examination of changes in shore line at the mouth of the Eel River; shore line survey from Red Bluff to Eureka; azimuth near Crescent City, and topography north from Point St. George; plane table survey of the north shore of the Columbia River, Oregon; completion of the topography of Fort Discovery and Washington Harbor and their connection with New Dungeness rock; plane table survey of Blunt's Island, from Admiralty Head to Deception Point.

SURVEY OF PLACER CLAIMS.—Commissioner Wilson, in a letter called out by correspondence with regard to a case on Deer Creek, near Nevada City, says:

"As to the particular method of subdividing legal subdivisions into ten-acre lots, I have to observe that they are susceptible of being subdivided, either into square lots of ten by ten chains, or into lots of five by twenty chains, by running measuring, and marking lines in the field due east and west, or due north and south, through the legal subdivisions desired to be subdivided into ten-acre lots, and in regard to which method the Surveyors-General have this day been instructed."

THE STEAMING DISTANCE between Melbourne, Australia, and Southampton, England, in nautical miles, via the Cape of Good Hope is 11,837 miles; Overland, via Suez and Gibraltar, 11,154; via Marseilles, 10,139; via California, 13,480. The actual distance as the crow flies is 9,179 miles.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Travelling Agents.

WM. H. MERRAT—Montana, and Utah.
S. H. HERRING—California.
J. M. WOLFE—Oregon.
L. P. MCCARTY—California.
L. MINER—Nevada, and Colorado.
A. C. KNOX, City Soliciting and Collecting Agent.

SUBSCRIPTION RATES.

CASH IN ADVANCE:—One year, \$4; six months, \$2.50; single copies, 10 cents; Monthly Series, \$4.50 per annum; Quarterly Series (stiff paper binding) \$5. [On Quarterly series, and papers sent to Foreign countries an additional sum must be added for advance postage.]

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 641 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock.

15v213u

GEORGE E. PHELAN.

W. H. J. BROOKS,
Searcher of Records, and Examiner of
Titles,

IN ALL THE COUNTIES OF CALIFORNIA.

Abstract of Titles, examined and reported on.

HAVING DEVOTED HIS ATTENTION TO THIS BUSINESS exclusively during the past twelve years, he is familiar with the land and Conveyancing Laws of California, the Spanish, Mexican and American Records, and the Titles to Real Estate in San Francisco and all the Counties of California.

Persons contemplating the purchase of Real Estate in any portion of California can have the Titles thereto examined and reported on with accuracy and dispatch on reasonable terms.

Office, 316 California Street,
SAN FRANCISCO.

REFERS to the California Immigrant Union, the Real Estate Dealers, the Federal and State Judges and Legal Profession generally in California.

A NEW REMEDY.

As this Preparation of these plants, lately made public (Patented June 23, 1870), but long proven in Siskiyou county, Cal., owes its efficiency entirely to its remarkable power of INCREASING THE INSENSIBLE PERSPIRATION, or, in other words, the VAPORY EXHALATIONS from the millions of minute pores of the EXTERNAL SKIN, from the crown of the head to the sole of the foot, it is all important that the direction to pass a sponge, or towel, dampened with saleratus water, under the clothing, twice a week, or oftener, be attended to.

Also, that when taken by LADIES, for IMPROVING THE COMPLEXION, for which it is very successful, that it should be in half doses, often repeated; and that one of the PILLS of Citrate of Iron and Gum Myrrh, which are beneath the bottom label of each bottle, be taken at night, much aiding in restoring Color in the Cheeks and Lips. To CHILDREN also, give it "little and often." It is agreeable to them any way, but especially if sweetened a bit; and it is admirably suited to their Diseases, which generally are those of the MUCOUS MEMBRANES.

FOR the irritated throats of PUBLIC SPEAKERS, Lawyers, Ministers, Teachers, and
FOR driving off threatened CONSUMPTION and Asthma, all Colds and Coughs;
FOR irritated Stomachs, from Bad Liquor, Alkali Water, Strong Coffee, Saleratus Bread;
FOR humors on the Skin, or MUDDY COMPLEXIONS, or, in a single sentence,
FOR all Diseases of the MUCOUS MEMBRANES, the Surest, and by far the
MOST PLEASANT MEDICINE yet found, in its TASTE and EFFECT, is

DR. FURBER'S CORDIAL
OF
MOUNTAIN BALM
—AND—
OREGON GRAPE,

Two Plants, abounding on the base of, and on the
Mountains surrounding
MOUNT SHASTA, CALIFORNIA,

For all of the purposes of the various PREPARATIONS OF SARSAPARILLA, richer in quality and more efficient as a RESTORER OF GOOD BLOOD, and acting equally as surely,

and as well on the LUNGS as on the STOMACH, is superior to other COUGH MEDICINES, by bringing BOTH to bear with the stimulated action of the WHOLE SKIN in throwing off Disease of either.

FOR SALE AT SAN FRANCISCO BY

R. H. McDONALD & CO., Druggists.

INVALIDS of any of the classes named above will find this worthy of TRIAL. Its virtues, as above asserted, not being visionary, but improved from the SHASTA INDIANS' knowledge and use of these PLANTS for centuries back, made known by them to us.

Such an Invalid, residing at a distance, wishing to try it, had better procure a package of one-fourth of a dozen, which can be done by sending in letter to the above a \$5 greenback, and directing that the package should be sent by WELLS, FARGO & Co's EXPRESS to that office which is nearest to the invalid's residence, and that person will be sure to get it.

LEA & PERRINS'

CHELSEA

Worcestershire Sauce.

Declared by Connoisseurs to be the only good SAUCE. The success of this most delicious and unrivalled Condiment having caused certain dealers to apply the name "Worcestershire Sauce" to their own inferior compounds, the public is hereby informed that the only way to secure the genuine is to ask for LEA & PERRINS' SAUCE, and see that their names are upon the wrapper, labels, stopper and bottle.

Some of the foreign markets having been supplied with a spurious Worcestershire Sauce, upon the wrapper and labels of which the names of Lea and Perrins have been forged, L. and P. give notice that they have furnished their correspondents with power of attorney to take instant proceedings against manufacturers and vendors of such, or any other imitations by which their right may be infringed.

Ask for LEA & PERRINS' Sauce and see name on wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester: Cross & Blackwell, London, &c., &c., and by Grocers and Oilmen universally. Agents, ROSS & CO., San Francisco.

A MEDICINE AS OLD AS TIME.—For aught we know to
the contrary, the Seltzer Spring was bubbling and spur-
tling when Adam walked with Eve in Paradise. Be that
as it may, its salutary properties have never been sur-
passed by any medicine of human invention. They have
however been embodied in all their native efficacy in
the delicious duplicate of the Spa itself, which is
cures of dyspepsia, biliousness, constipation, cholera,
nervous debility, dropsy, rheumatism, &c. &c. &c. &c. &c.
and as marvelous as those attributed to the famous
Spring, and which the faculty of Europe have placed on
records as among the medical miracles of the age.

Reading for the Hour.

Curiosities of Vision.

We presume that most of our readers have a general notion of the structure and working of the human eye. They know that the little sphere, of an inch or so in diameter, which forms the eye-ball is a camera, essentially like the one used by the photographer to throw the image of external objects upon the surface prepared to receive it and placed within the apparatus. The mere forming of this picture inside the eye is not, however, seeing. The picture might as well be anywhere else if there were not some means of making the mind aware of its existence. The optic nerve answers this purpose—a branch of the brain which enters the eye through a small hole in its rear, and spreads out in a delicate network over the surface whereon the picture is formed. The impression made by the rays of light upon this network of nerves is telegraphed to the mind, which then sees the object, or, rather, from seeing its image in the eye, comes to recognize the existence of the object itself outside the eye.

If the optic nerve should be severed, the picture in the eye might be as perfect as before, but we should nevertheless be blind to it. If any portion of the network of nerves just mentioned should be paralyzed, we should cease to see the part of the picture formed on that portion of the eye's inner surface. If the entire image of some small object should fall upon that insensible spot, we could no more see it, even though looking straight at it, than if we had no eyes or kept them shut. Now it is a curious fact that there is such a "blind spot" in every human eye; and, what is more curious, it is found to be just where the optic nerve enters the eye—the very place which we might suppose would have the keenest sight of all.

Here is a simple little experiment by which we can prove the existence of this blind spot in our eyes. Shut your left eye, and with the right one look steadily at the cross just below, holding the paper ten or

twelve inches from the eye. Now move the paper slowly toward the eye, which must be kept fixed on the cross. At a certain distance the other figure—the black dot—will suddenly disappear; but, if you bring the paper nearer, it will come into view again. You may not succeed in the experiment on the first trial, but with a little patience you can hardly fail; and the suddenness with which the black spot vanishes and reappears is very striking. Now, examination has shown that when it disappears its image falls exactly on the spot where the optic nerve enters the eye; thus proving that spot to be blind.—*Jour. of Chemistry.*

JAPANESE SCIENCE.—A writer from Japan describes an ingenious method practised in that country for getting water from the bottom of a deep lake. For this purpose a cono-shaped earthenware bottle was employed, having a hole at its apex and a very small one at the broad part, which was stopped by a gum soluble in water. The bottle was then sunk apex downwards, by means of a weight and a line, and allowed to remain about a quarter of an hour at the bottom of the lake, by which time the gum was dissolved and entrance for the water obtained, the air being forced out through a little hole at the bottom. It was then drawn up, and the hole at the bottom plugged with a tiny wooden peg.

THE POWER OF A BIRD'S SONG.—When we hear the song of a soaring lark, we may be sure that the entire atmosphere between us and the bird is filled with pulses, or undulations, or waves, as they are often called, produced by the little songster's organ of voice. This organ is a vibrating instrument, resembling in principle the reed of a clarinet. Let us suppose that we hear the song of a lark, elevated to a height of five hundred feet in the air. Before this is possible, the bird must have agitated a sphere of air one thousand feet in diameter; that is to say, it must have communicated to 17,888 tons of air a motion sufficiently intense to be appreciated by our organs of hearing.—*Prof. Tyndall.*

PIONEER'S CABINET.—The Pioneers have put up a handsome mineral cabinet in their hall, and invite donations.

Washing Diamonds.

The Cape Town *Argus* of August 27th gives a description of the manner in which diamonds are washed out of the claims in the African diamond fields which have been creating so much sensation of late. Thinking that it will be of interest to many of our readers, we condense and quote. The writer affirms, by the way, that, while many valuable gems are found, the affair is like a lottery,—only the few "lucky" ones win prizes; but if all the stones found were to be divided equally among all the diggers, no one would have paid expenses.

In the first place the ground is got out, and in the getting out of that, stones have to be removed, sometimes two hundred pounds in weight. When you have a heap out, of say ten Scotch cartloads, it is sieved. At first this was done in a common round corn sieve, but —, the Yankee, whom you knew in Cape Town, has invented a machine by which we can concentrate ten loads into four in about two hours. This is what is called the "Yankee baby." The whole is slung with a strap on to a frame, consisting of four uprights, and binders holding it together. The ground is thrown by one man on to a sieve. The rocking of the sieves causes the gravel and sand to pass through the meshes—about one inch square—and the large stones are thrown off at the point. After passing through the sieve, the gravel and sand are caught on a sliding board and conducted over another sieve, which is made of fine corn sieving. The rocking causes all the sand to pass through a sieve, and all the gravel ready for washing is ejected without a single large stone or particle of sand. This latter portion is ridden down in Scotch carts to the banks of the Vaal, where it is passed through the cradle.

The ground is thrown into a sieve into which water is either pumped or poured in with buckets. When clear enough through the water and rocking on rockers, the top sieve is taken out, and a sieve, consisting of pierced iron, zinc or tin, with holes, is then roughly washed, being the most important. When washed it is thrown out on a table to be sorted. Three of us with hard work, can turn out about three loads of sifted stuff in six hours; but we are quick sorters, and some men with two sorters can only do one load a day.

Nuptial Hymning.

Among the many specimens of her great agricultural fertility which Oregon is continually producing, we notice from time to time several of a rythmical tendency. One, sprouted during the last month or two, has particularly attracted our attention, as showing something of the immense amount of melancholy enjoyment which can be derived from a wedding. We give it below. We've enjoyed it very much ourselves, although not quite certain as to what that "same" might be, which is spoken of in the first line of the second stanza.

May God receive her to his Throne,
When on earth her race is run;
For she is gentle like a dove;
Long may she live in peace and love.

For all of us have done the same;
But she is happy and we'll not complain;
God only knows how we shall miss her;
Thus are we deprived of our baby sister.

The bold originality of transferring the range of such poetry to the broad untrodden field of weddings from the more confined and over-worked limits of funerals is simply affecting. And in order to afford the reader the renewed pleasure of reading the effusion a second time, and as, moreover, it doesn't seem to make any difference with the sense or rhyme, we have "stood" the poem on its head, so to speak. By commencing at the bottom and reading upwards, lovers of the curiously beautiful and the beautifully curious will discover exactly how the thing originally appeared.

A SCIENTIFIC POPULATION.—A correspondent of the St. Louis *Republican* says of the town of Greeley, in Colorado, that it has 238 voters, nearly one half of them professional men, 40 college graduates and 16 ex-members of legislatures. They already have about 20 prospective governors, and 30 members of the legislature when Colorado attains to the dignity of Stateship. In time, no doubt, the town will be able to supply the entire West with officials.

Ideal Feet.

The celebrated anatomist, Professor Hytel, of Vienna University, recently opened one of his lectures to his class with the singular question, "Which is the most beautiful foot, considered from the anatomical stand-point?" and then said: "It is remarkable that there can be so many divergent opinions on this subject. While the sons of men look upon a small, slender, and graceful foot (if a lady's foot) as an ideal one, the anatomist utterly rejects it as beautiful; and only the large, long, and broad foot is the ideal one in his eyes. Even the greatest classical writers of antiquity—Horace, Catullus, and others—who had great appreciation of feminine beauty, never mentioned, in the descriptions of their beloved, their small feet. The people belonging to the Celtic race have small feet; the Hindoos, especially, have such small feet and hands that they may be envied by many European countesses. The native troops of the English army in India possess in England their own armory, whose peculiar kinds of weapons are constructed for them. The sword-hilts made for them are much too small for us to grasp with ease. The greatest beauties of Europe—the Italians—have really long and broad feet."

A SURGEON'S BILL.—We find the following anecdote concerning the celebrated surgeon, Nélaton, whose name is familiar to every one in connection with the physical troubles of the Emperor Napoleon. Going through one of the streets of Paris one day, he came upon a crowd standing in front of a drug store. There a man lay stretched out, who had been terribly wounded in the abdomen by a sharp buggy shaft, so that a large part of his intestines protruded. His life could be saved only by a very difficult and dangerous operation; but Nélaton was equal to the occasion; and soon his patient, quite a wealthy man, was sent home out of danger. For three weeks Nélaton heard nothing more of him; but then he made his appearance, and asked his preserver how much he owed him. "Hundred and fifty francs," replied the surgeon. "That is too much," said the man, "but give me a specified bill; here is your money." Nélaton sat down and wrote as follows: "For adjusting a metre and a half of the intestinal canal, at a hundred francs per metre, one hundred and fifty francs."

BRIGHAM YOUNG ON LAWYERS.—Brigham Young is reported to have paid his respects to lawyers, in a late discourse at Salt Lake City, in the following terms:

I will say right here that of all men who ever did live upon the face of the earth, lawyers are the worst. Doctors and priests are bad enough, but lawyers will ruin everybody and send all to hell. They are the worst and most unfit for human society of any beings that live, and if mankind would do as Peter, the Emperor of Russia, talked of doing when watching the doings of lawyers in Westminster Hall, England, they would not do a bad thing. Being asked, "do you not have lawyers in your kingdom?" Peter replied; "Yes I have two, and when I get home I shall hang one of them." If all lawyers were served in the same way, communities would be saved a great deal of anxiety and trouble.

ANTIQUITY OF SOAP.—The word Soap or Sope, from the Greek *sapa*, first occurs in the works of Pliny and Galen. Pliny states soap to have been discovered by the Gauls, that it was composed of tallow and ashes, and that the German soap was considered the best. According to Sismondi a soap-maker was included in the retinue of Charlemagne. At Pompeii (overwhelmed by an eruption of Vesuvius, A. D. 79), a soap-boiler's shop, with soap in it, was discovered during an excavation made there not many years ago. Hence the manufacture of soap is of very ancient origin; indeed Jeremiah figuratively mentions it—"For though thou wash thee with natron, and take thee much sope, yet thine iniquity is marked before me." (Jer. ii. 22).

In making experiments with tuning-forks by holding one to each ear at the same time, Herr Fessel, of Cologne, discovered the ears do not possess an equal power of hearing. It appears that from numerous trials on various individuals the hearing is generally best with the right ear. A similar difference in the power of the right and left eye is also more common than is generally supposed, as the impression made on the weaker eye is generally absorbed or dissipated by the stronger.

CURIOUS EXPERIMENT.—An interesting experiment, which, though not new, is not generally known, may be performed as follows: Roll up a large card into a tube a quarter of an inch in diameter, and make the joint tight by a little sealing-wax. Then cut a disc of card two inches in diameter, make a hole through its center exactly big enough to admit the tube. Sealing-wax the card disc on the top of the tube so as to form a flange, taking care not to let the tube project above the surface of the disc. Cut another card disc of the same diameter, and lay it on the former, holding the tube quite upright with the disc uppermost. Blow gently through the tube, and the loose disc will be thrown off the flange. Replace it, and blow with great vehemence. The disc will then not be thrown off, but will remain close to the flange, vibrating strongly. The loose disc may then be placed on the table, and the tube with the flange downwards held very near it. On blowing violently the loose disc will spring up toward the flange and vibrate as before.—*Sci. Discovery.*

TRIMMED AND READY FOR BURNING.—Several years since a company was formed for the purpose of prospecting for gold in the Butte mountains. They sunk a shaft about eighty feet deep at the base of the South Butte. Through this shaft a strong current of gas issued, which induced them to put in a pipe about two inches in diameter and fill up the shaft. Since that time a constant stream of gas has been flowing, which, if touched with a burning match, will blaze perpetually, and during the night furnishes a brilliant light, which may be seen a considerable distance. This gas well is situated close to the residence of Wm. Vanfleet, who contemplated making this light available, by conducting it through pipes to his house, believing it to be too good a thing to lose. This gas, taken in connection with the color and appearance of the dirt raised from the bottom of the shaft, sh was conclusively that a stone-coal bed is not far off.—*Appal.*

WALKING.—Our women, an accurate and critical observer (G. W. Curtis, if we mistake not) remarks, are too stiff in their walk and attitude. In walking, an American woman only bends her knees, and hardly that; she should yield a little in the upper joints. Her gait gives a movement to her body like the squirming motion of a wounded insect with a naturalist's pin through its midriff. American women hold their arms badly in walking; they almost universally bring them forward, crossing their hands in front; they have, in consequence, the look of a trusted fowl, and have about as much freedom of motion. If the arms were allowed to fall freely by the side, our women would move more gracefully, walk better, and look better. The prevailing mode of carrying the arms hoops the shoulders, contracts the breast, prevents all proper development of the bust, ruins health, and what our ladies will be more likely to attend to, destroys beauty of form and all grace of movement.

ANTIQUITY OF PERFUMES.—Pliny describes a mixture of dried flowers and spices, corresponding with the *pot-pourri*, of the modern perfumer. Among the curiosities shown at Alnwick Castle, is a vase that was taken from an Egyptian catacomb. It is full of a mixture of gum, resins, etc., which evolve a pleasant odor to the present day, although probably 3,000 years old. Frangipani Powder (spices, orris-root, and musk or civet) was invented by one of the earliest of the Roman nobles named Frangipani. The Egyptian ladies carried a little pouch of odoriferous gums, as the Chinese do to the present day. Several passages in Exodus prove the use of perfumes at a very early period among the Hebrews, as "sweet spices, stacte, onycha, and galbanum, with pure frankincense;" and the "bellium" mentioned by Moses in Genesis is a perfuming gum resembling frankincense, if not identical with it. Perfumes were also mixed with the oil and wax for the lamps and lights commanded to be burned in the house of the Lord. Galen, the celebrated physician of Pergamos, who lived about 1,700 years ago, invented the *ceratum Galeni*, the cold cream of the present day. In southern Italy so great was the trade in unguents and perfumes, that the unguentarii or perfumers are said to have filled the great street of ancient Capua.—*Piesse.*

VALUABLE.—A Pennsylvania miner wants to sell to the Central Pacific a bed of coal "six feet square," situated within 80 miles of Ogden.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, OF Enameled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. oct18-6m B. F. HOWLAND.

The word "SOZODONT," which is fast becoming a household word, is derived from the Greek, and composed of two words, "SOZO," and "ODONTES." "SOZO," translated, means to preserve, and "ODONTES," the teeth. SOZODONT, a preserver of the teeth. And it is true to its name.

"SPATULINO'S GLUE" will mend your ways, or anything else that needs mending.

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your journal is very valuable. No better investment for \$1. Respt. B. C. B.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the mechanic and laboring man fully appreciate it. They are now enabled to buy their groceries and provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

Mining and Company Adv'ts.

Every Advertisement in this journal is published throughout its entire Mining, Agricultural, Monthly and Quarterly Editions.

Mountain City Mining Company.—Location of Works: Cope District, Elko County, State of Nevada.

NOTICE.—There are delinquent upon the following described stock on account of assessment levied on the 25th day of Sept. 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificates.	No. Shares.	Amount.
Best, John T.	61	400	\$200.00
Greck, H. J.	42	100	50.00

MECHANIC ARTS COLLEGE.

UNIVERSITY OF CALIFORNIA.

Inauguration of the University Lectures in San Francisco.

A BRANCH OF THE MECHANIC ARTS

College of the University has been established in San Francisco, for the instruction of all males and females engaged in mechanical or other industrial pursuits.

Instruction will be given by means of a series of Lectures by the several Professors of the University—each in his specialty—assisted by other gentlemen eminent in the ranks of science. These Lectures will be illustrated by the valuable apparatus of the University.

PROFESSOR JOSEPH LE CONTE

Will inaugurate the exercises by a course of Lectures on

Geology and the Coal Measures of the Pacific Coast,

The first of which will be delivered in the Hall of the Mechanics' Institute, Post Street,

On Saturday Evening November 12, At 7 1-2 o'clock P. M.

The Lectures will be continued on each succeeding Saturday evening at the same time and place.

PROF. JOSEPH LE CONTE will follow with a series of Lectures on INDUSTRIAL MECHANICS; PROF. E. S. CARR on CHEMISTRY, and the other Professors on practical subjects connected with their Departments.

All are invited to attend—free of charge—and those who record themselves as regular Attendants, will be enrolled as students at large of the Mechanic Arts College of the University.

MARTIN KELLOGG, Dean of the Faculty.

THE MASONIC MIRROR

Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a

QUARTO-MEDIUM SIXTEEN PAGE PAPER

AND IS A FIRST CLASS

Literary and Family Newspaper,

AS WELL AS THE

Organ of the Masonic Fraternity on the Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by the M. W. Grand Lodge, F. A. M., of the State of California, at its Annual Communication, October, 1870.

Whereas, in the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,

Resolved, That this Grand Lodge, recognizing in the Masonic Mirror, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said Masonic Mirror to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. F. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the Masonic Mirror, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The Mirror presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

A Valuable Improvement

—ON—

Combination Locks,

And Fastenings for Vaults and Safe doors. Invented and Patented by Kirtledge & Leavitt of this city. The improvement of which consists in the applying of a "Detachable Knob" or Wrench to the Arbors or Cylinders, passing through the door, so as to operate the Lock and Fastenings on the inside—leaving the outer end sunk or even with the surface of the door. It is made of hardened steel and is so constructed as to resist the operations of the Burglar, rendering the Lock perfectly secure and safe.

All parties are hereby cautioned not to infringe on this patent, as the owners will protect their rights to the full extent of the law. None genuine unless marked K & L's Patent. Manufactured and sold by

KIRTLEDGE & LEAVITT, Patentees,

GODDARD & CO.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 24, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Carratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Ema Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentees, WIRTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 25d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and out kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3 Mill, 9 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an ever increasing popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20v19-4t Supt. W. P. S. S. M. Co., Philadelphia.

CRAIG'S PATENT

IS THE VERY BEST
Ever offered to the public in shape of a
HYDRAULIC MACHINE.
As the hundreds now at work will bear witness.

NOZZLE.

Caution to Everybody.

Be it known that the Hydraulic Chief, manufactured by F. H. Fisher, of Nevada City; Champion Nozzle, made by Thos. Watson of Nevada City, and Dictator, made by Richard Hoskins, of Dutch Flat, 427 are infringements upon our Patents dated Dec. 8th, 1865, Dec. 7th, 1869, Dec. 28th, 1869, and that suits are now pending in the U. S. Courts which involve the working principles of each and all the above named contrivances, and that we will prosecute all responsible parties who make, sell or use, without our consent, any one or either of them.

R. R. & J. CRAIG, PROPRIETORS,
Nevada City, California.

PRESCOTT & SCHIEDELL, Sole manufacturers,
Marysville Foundry,
11v21-3m

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, made, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

THE

ASPHALTUM PRESSURE PIPE

COMPANY,

HAVING ERECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities,

Are now Prepared to Take Orders

AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; its lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Mark St. 16v21-4t

MILLER & HALEY'S MILLS,

BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers.

19v21-3m MILLER & HALEY,

THE SCIENTIFIC PRESS has the largest circulation of any weekly journal published West of the Rocky Mountains, independent of a daily issue. Its readers are prominent among the most intelligent, industrious and thrifty classes throughout the Pacific States and Territories.

WIESTER & CO.,

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

NEW HOSE COUPLING.

This coupling is one of the most useful and perfect inventions of the day. It can be joined almost instantaneously and answers equally well for gas or water hose. Coll and examine samples. The Right, to any town or city on the coast, will be sold at a reasonable price.

Dennis Combination Gridiron.

No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!

By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest bit is used and the horse's mouth cannot be injured. No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East. We invite manufacturers and others, to call at our office and make their own investigations.

Mining Edition.

The Bessemer Process under Pressure.

A difficulty experienced in treating certain qualities of pig-iron by the Bessemer Process, has been that sufficient heat was not produced in the converting vessel to allow all the steel to remain fluid until poured into molds. To obviate this trouble, Mr. Bessemer some time ago invented a method of conducting his process under pressure. We have spoken of this previously, and having obtained the proper illustrations from the *American Artisan*, propose to recur to the subject which will be more fully understood by the aid of the cuts.

The vessel is constructed very solidly, and the mouth is by preference circular, instead of oval, and also of smaller size than usual. Fig. 1 shows such a vessel. Here *a* is the upper part of the converter; *a'*, the lining of gannister; *b*, the strong riveted iron shell; *c*, an iron hoop riveted on this shell, and to which is secured a flanged iron ring, beveled on the inside. This last holds in place a molded ring, *e*, of fire brick or other suitable material, which forms the mouth of the vessel and which can be easily removed when worn out. To make the joint air-tight, a mixture of fire clay and gannister is smeared over the parts of *e* which come in contact with the holding ring and with *a'*.

The mouth of the vessel can be thus contracted sufficiently to retain the gaseous products of combustion under very considerable pressure, and thus a more intense heat would be produced and imparted to the metal. The amount of pressure thus obtained should vary with the heat-producing properties of the carburized iron treated and the quantity of scrap or other unfused metal of the charge, so that no precise rule for the necessary amount of pressure can be given. As a guide, Mr. Bessemer states that, for converting purer kinds of Swedish charcoal pig-iron and for mottled or white hematite pig-iron mixed with gray, a back pressure in the vessel of 8 to 15 lbs. on the square inch will give good results. A pressure as low as 3 or 4 lbs. causes but little gain, and below 2 lbs. nothing is claimed. Of course, the pressure of the blast of air forced into the vessel must be increased in proportion to the back pressure caused by penning up the gases by contracting the escape vent.

But the mode of obtaining the required back pressure by simply diminishing the outlet does not offer all the desired facility of regulating this pressure as required, while trouble may ensue from the accumulation of slags in the aperture. The method which Mr. Bessemer prefers is to

use a moveable conical stopper attached to the end of an iron rod, as shown in Fig. 1. Here *f* is a conical piece of fire brick, of the form shown, which protects the rod *g* from the action of the flame. This rod may protrude through the back wall of the converting house, or be supported on an iron frame in connection with the standards which support the vessel, and by means of a screw or lever is made to advance into or recede from the mouth of the converter, increasing or diminishing the area of exit *e'* and regulating the pressure. Or the stopper may be made self-acting by applying a spring or other device to press it forward against the forcibly escaping gases;

runs (and is thus kept always over the center of the aperture) through tubular guides and stuffing box formed at *i*, on the flue, *u*, leading to the chimney and conveying away the escaping gases.

At one side of the vessel is a projection, *v*, on the upper part of which a ring of fire-brick, *w*, is retained in place by a conical flanged ring, *x*. The opening in *w*, serves for the admission of the molten metal into the vessel, after which the cone, *y*, smeared with fire-clay, is lowered into this opening and retained in place by means of the weight, *z*, thus preventing the escape of gases at this point. By means of the chain shown above *z*, the cone can be re-

CONVERTING VESSELS FOR THE BESSEMER PROCESS UNDER PRESSURE.

or various other devices may be employed.

When nitrate of soda or of potash or other oxidizing salts are employed for decarburizing purposes, a large amount of heat is absorbed and rendered latent, thus tending to solidify the metal and rendering it unfit for forming into ingots or castings without being remelted. The arrangement for such a case is shown in Fig. 2. The very strong vessel has an outer shell, *h*, of thick plates of iron or steel securely riveted and calked at all joints and capable of withstanding safely a pressure of from five to ten or more atmospheres. For further strength, one or more hoops, *h'*, are riveted to its exterior. The lining, *i*, is of fire-brick, gannister or other suitable material.

On the upper part of the dome is riveted an iron ring, *m*, to which is fitted a flanged ring, *n*. The inside of this last is conical and holds the conical fire-clay ring, *p*, forming the mouth of the vessel. A cone of fire clay or iron, *g*, for increasing or diminishing the area of the outlet, is attached to a rod, *r*, on the top of which weights, *s*, regulate the pressure. This rod

is moved and suspended when necessary.

When the metal run in at *w* comes in contact with the nitrate or oxidizing material, large amounts of gases are evolved. These gases accumulate in the converter until the pressure is sufficient to raise the cone, *g*, at the top, when they escape through the small annular opening thus made, the pressure being regulated by weight, *s*. "Hence the combustion of the carbon contained in the molten iron by reason of its union with oxygen, derived from the decomposition of nitrates or other oxygen-yielding materials, will be effected under considerable pressure; and under the ordinary conditions of combustion, will be in a highly condensed state, by which means their temperature will be considerably raised, and the intense heat so generated will be imparted to the metal and cause it to retain its fluidity."

LOCATED. — The Dalles Military Road Company (Oregon) have located 60,000 acres of their land grant in John Day Valley.

Johnson's Patent Portable Fence.

Fences occupy a very important position in the economy of a farm, and when constructed for durability are generally very expensive. It is often found a very great advantage to have a portable fence, which can be changed from one position to another on a farm, or on pleasure or ornamental grounds. One of the best of this class of fences is the one herewith illustrated—a California invention, which was patented through the SCIENTIFIC PRESS PATENT AGENCY about one year since. This fence can be readily taken to pieces or separated into panels, and can be built for less than the cost of an ordinary stationary fence of the same class and height. The braces by which it is supported make it amply firm and strong against either the inroads of cattle or violence of winds.

It will be readily perceived, by reference to the illustration, how the panels are put

together, and how they are held in place. The ties are so constructed that the fence may be placed either in a straight line, or bent to any desirable angle. The act of removing or placing them is but the work of a moment; not even a hammer or any other tool being necessary in setting up or taking down.

The famous showman P. T. Barnum, who recently visited this coast, and who is proverbial for his practicability and sharpness, has adopted the invention upon his fine grounds, and speaks of it as follows:

WALDEMEER, BRIDGEPORT, Ct.
Oct. 28th, 1870.

MR. CHARLES E. JOHNSON, San Francisco, Cal.—Dear Sir,—I find upon trial that your portable fence is by far the most complete and desirable plan I have ever seen for constructing a fence that can be put up and taken down in a few minutes. It is light, cheap and effective. Nothing can surpass it where fences require removing often. Truly Yours

P. T. BARNUM

This fence may be seen at Woodward's Gardens, in this city, where it is in use, and highly recommended by the proprietor of that famous place of resort. It is also in use at other localities, and is everywhere highly recommended. For further information, address C. E. Johnson, P. O. box 995 San Francisco, or care of SCIENTIFIC PRESS.

THE CABLE to connect the Isthmus of Panama with the United States by way of Jamaica was landed at Aspinwall, October 24th, and the steamers *Vestal* and *Dacia* started for Kingston, Jamaica, to lay the cable on their way. But according to the latest despatches, the attempt failed.

Communications.

In this Department we invite the free discussion of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Sierra County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Fur-Top—Morristown—Portwine.

Fur-Top (or Eureka) is about eight miles distant (by trail) from Downieville. The principal mines at this place are owned and worked by Messrs. Beard & McBride. They can work only from April 1st to July 1st; during the winter it is perpetual snow; in the spring when it begins to melt then work begins.

Morristown is four miles from Fur-Top, and is similarly situated as to its mines. Thos. Wheeler is principal owner; during the months of April, May and June, this year, Mr. W. paid out for wages alone \$25,000. One of Fisher's Shoo Fly's, is the hydraulic device in use here.

Portwine, four miles from Morristown, on the 1st day of September last, was almost entirely consumed by fire; the loss was estimated at from \$75,000 to \$100,000 with only \$4,500 insurance on the whole town. Nearly everybody has rebuilt, and although poor, the people expect to out-live it. The Monte-Cristo mining company's works are situated three-fourths of a mile north-east from Portwine. It is a deep channel, blue gravel deposit, and quite rich. Company consists of 40 shares, each personally represented; the Secretary, Treasurer and Foreman constitute a board of three trustees who manage the same. The claim is worked by drifting; they have a fine hoisting works run by steam engine, over an incline shaft down 435 feet, running at an angle of 45 degrees. The main lead is about 700 feet wide, and runs through the ridge to the east, widening out to 1,600 feet on the opposite side. The drifting gravel is from three to four feet deep. The claim is not yet thoroughly opened to show its real value, but prospects well. UNION MINE, adjoining the Monte-Cristo, have 38 shares in their claim, each personally represented; have hoisting works run by a Frederic water wheel, which cost \$4,000; three trustees manage the mine. A. Kleckner is Secretary. Their tunnel is in 5,110 feet; they work day and night, and have taken out \$70,000 since January last. The pay gravel is the same as in the Monte-Cristo.

St. Louis—Poverty Hill.

St. Louis is situated five miles east of Portwine. The SEARS UNION WATER CO. (incorporated) have their office at this place. They are engaged at ditching and mining. The capacity of their ditches is 1,500 inches, the length 20 miles; they take the water from Slate Creek and its tributaries and distribute the same at Howland Flat, Pine Grove, Chandlerville, St. Louis and Scales Diggings. This company is mining successfully ground at Chandlerville that, under the old process of hydraulic, would not pay expenses. After four years of bed rock tunneling at Scales Diggings (some six miles distant) this company have their tunnel in through the rim rock, have a shaft raised out to the surface, also a tail flume in 3,000 feet long, 40 inches wide and three feet deep, paved with blocks; 1,200 feet of 15-inch pipe convey the water to a Craig's Glohe Nozzle, under a pressure of 202 feet. They commenced operations a few days since. They own on the old ancient channel, or river bed, 1,000 feet wide, nearly a mile in length, and averaging 200 feet deep, ground enough to last them for 50 years to come.

Poverty Hill, two miles north of Scales Diggings, is one of the most lively mining camps at present in this county. Among its principal operations there is the GOLD VALLEY MAIN TUNNEL and M. Co., (incorporated) owned by the Smith Bros. and James Lafferty, of Poverty Hill, E. Judson (of the Giant Powder Co.), Doe, and others of San Francisco. The tunnel this company have in course of construction, it is estimated, will cost from \$60,000 to \$75,000, will be 2,000 feet long when completed, and will require from two to two and a half years yet to finish the same. A vast blue gravel deposit, deep channel diggings, claimed by 80 different companies, will be benefited by this enterprise, by paying a small amount for flume privileges. Seven men are kept constantly at work on the tunnel night and day. By hydraulic process this gravel is easily washed, the boulders being small and few. The proprietors of the above mentioned tunnel may adopt (or bring into requisition) the Diamond Pointed Steel Drill; if they do, I prophesy that nine months hence will see their enterprise complete.

Howland Flat.

Howland Flat, situated three miles north-east of St. Louis, is the head quarters (in winter season) for Snow Shoe Racing in Sierra Co. This is more exciting than the turf with its best horses, in any part of the country. Without going into details, let your readers imagine 60 men contending for a prize, in squads of six each, armed with snow shoes from eight to 14 feet long; the ground to be run over three-fourths of a mile down a steep mountain, and the winner to make the time in less than one minute! Then a faint idea may be had of a snow shoe race.

The mines of Howland Flat are the UNION GOLD M. Co. (consisting of 5,000 shares, principal office in San Francisco; R. Dorn, Sec.) situated next the adjoining town. This claim, together with all others, here are deep channel diggings, and worked by drifting; for the last

13 years this claim has been successfully worked, the dividends satisfying its proprietors. From 70 to 75 men have been constantly employed during that time; just now but little is doing in this mine, as the superintendent, Mr. Geo. H. Moyle is making preparations to more successfully work the same by reducing the expenses, which necessarily increase as they get further from the surface. They own ditches, and a sufficient supply of water for hoisting purposes and washing the year round.

The MONUMENTAL CO., situated one half mile above Howland Flat at Potosi, is at present working the most men, have the longest tunnel, and is the best paying in this section. Next adjoining this is the PITTSBURG M. Co. (incorporated) consisting of 96 shares; began tunneling in 1856, struck gravel in 1860, was successfully worked with a force of 40 men up to and including 1868. Since then and up to a very short time, they have worked the same through an incline, owing to swell rock and other obstructions in their tunnel. This mine has a frontage of 800 feet running to the top of the mountain 3,100 feet; attached to the same is 2,500 feet of tailing ravine. Since last May, the company have been working their diggings through the Monumental Co.'s tunnel, the latter named company hauling the Pittsburg Co.'s pay gravel to the mouth of the tunnel with mules at a certain price per ear load. At the present rates of labor this company estimate that by Spring they will have worked out all that will pay them to.

L. P. MC.

All About Montana.

[Written for the Scientific Press.]

Indian Creek.

When at Radersburg, I paid a visit to the mines of Indian Creek, about eight miles distant on the road to Helena. There are quite a number of claims here. The placer mines, according to all I could learn, are not generally doing very well this year, and the water season is now rapidly drawing to an end.

I had here the pleasure of meeting Capt. S. Lewis, of Pittsburg, Pa. Mr. L. came out here to superintend the erection of a fine quartz mill which was shipped to this Territory some years ago, but from some cause or other has not been worked. The mill has 16 stamps, copper plates, etc., which with all the necessary machinery were manufactured at Mr. Rees' machine shop at Pittsburg; and they show superior workmanship. The mill, located at a place called St. Louis, belongs to the Pittsburg and Indian Creek Montana M. Co. Mr. Jas. Rees and Capt. S. Lewis are among the principal stockholders. The mill will be in full blast, it is said, in 30 days from the present date.

The Diamond Ledge, located about half a mile from the mill, has been purchased by the company. The ledge is 16 feet on top and 15 feet at the bottom of the shaft which is 78 feet down. The ore prospects well and will run from \$15 to \$30 per ton, and will be considered first class if it averages \$20, which will pay well here where wood is cheap and plenty.

There is another mill (with five stamps) in this section which will be running in a few days.

[Our correspondent has sent us a letter from Bozeman, which will appear in our agricultural columns. We here commence with a third letter.—Eps. Press.]

Virginia City.

Virginia City (Madison County), the capital of Montana Territory, was located in 1863, on Alder Gulch, about seven miles from its mouth. The gulch is about 17 miles long. The city once had a population of 10,000, in the palmy days when the gulch yielded such fabulous sums; it now has 867 according to the late census returns. It contains two banks, some good hotels, an International and Clatsby House, and a few nice buildings; but the place seems dull and shows signs of decay.

Alder Gulch has produced wonderfully in former days. Exactly what amounts of gold have been taken from it, it is impossible to say, and the estimates vary greatly. I have one account which gives the amount in 1864 alone as \$20,000,000; and another which estimates it as \$30,000,000 from 1863 to 1866. Whatever it was, it was astonishingly large, and as regards yield Alder Gulch is to be placed among the first in the world, without doubt. I find that mining operations are still going on here, much of the ground being worked over and paying. On my way down to Nevada City (a small place about two miles from Virginia) I visited a number of claims. The ground of O. A. Sedman & Co. is said to be paying well. The company own large claims on the Creek and have a very long line of fluming (box). Griffith & Thompson, Fenner, the Cork company (on Bummer Dan's bar) are all doing well, I am told, as are some others. At the head of the gulch the Montana G. and S. M. Co. own some valuable property (quartz) but are doing but little at present. I hardly think, however, that the country has been properly prospected for quartz veins. I shall speak further on of operations below Virginia.

There is a paper, the daily and weekly *Montanian*, published at Virginia. It is edited (and published) by Mr. Jo. Wright. [Some time ago we published an account of the working of the Paul Process (spoken of below) clipped from a "Montana paper." It was sent us by a gentleman of our acquaintance, but the locality of the paper was torn off and consequently we could not credit it properly. The character of the sender was guarantee for the clipping which, we now believe, was from the *Montanian*.—Eps. Press.] When here I was shown about the fine garden of Mr. John Bar-

ruff by the proprietor. Mr. B. showed me, among other things, a cauliflower which was 16 x 18 inches, and very solid, and cabbages, known as "drum-heads," which were 16 inches through. Mr. B. has a model garden and does a profitable business; for gardens are rare up here at an elevation of over 5,000 feet.

Brown's Gulch—Paul's Process.

Leaving the main creek, I visited Brown's Gulch, three miles from Nevada. Here I found the Conner steam quartz mill in full blast. Mr. John How, the well known quartz man, has leased it and started it up with paying results. The mill has 10 stamps and a 40-horse power engine and was built in Hartford, Conn. It is running at present on ore from the Jewel House lode. The quality of the ore being base (the metals are gold and silver, the latter predominating), Mr. Frank Morgan, who ably superintends, concluded to try Paul's Electric Dry Amalgamation Process, but on a small scale at first. The results were eminently satisfactory. The parties tell me that they are fully satisfied and more than satisfied that the process will work well for their ore, which from its character has hitherto caused them much trouble, all of which is obviated by Mr. Paul's system. This is certainly a great card for his process and deserves wide mention, for these are working results on rock which would not pay by previous methods.

There is a large number of mines in this section, as the Brown, Black, Pacific, etc., etc. The Pacific is owned by N. D. and N. Johnson, who have a tunnel 90 feet in on the lode and a shaft down 60 feet. The ledge will average seven feet in width. The ore has been worked in an adit. They worked only a few months last year, while they could get water to run their wheel, and their rock paid \$767.

Granite District, located but a short distance from Nevada City, is a canyon which forms the main gulch of the Alder. There are two mills here.

W. H. M.

TO BE CONTINUED.]

A Trip Among the Mines.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

On the road from Marysville to Camptonville lie two places of considerable importance concerning which nothing appeared in my letter last week. BROWNSVILLE is the first place. The principal mining is quartz and has been carried on with great success, the Jefferson and Pennsylvania mine, being the most prominent; but even these appear now to be the remains of what was once a flourishing mining district. I am informed that the Marysville people invested large amounts of money in this place, and did not get much of it back again. Probably they started in too late. Some portion of the old mills now standing mark the site of former operations.

BANGOR is the second place. It is about five miles off from the stage route, and lies south east from Oroville. The old channel of gravel is about 60 feet below the level of the lowest ravine, and contains a deposit of hard blue cement, 60 feet wide and about six feet deep. It has been worked quite successfully by some companies, and one or two claims are now being worked, which pay a profit. It requires stamp mills to reduce the hard cement.

SCALES DIGGINGS. From Big Oak Flat I came to this place. Here I found Messrs. Pratt, Ally & Co. who gave me some information. This is also an old camp; much work has been done here and large amounts of money have been taken out. The scarcity of water at this season prevents working which is done by hydraulic. I understand that they use 280 feet fall. I was told that a Col. Williams of Oakland, and partner of Mr. Cox of this place, is expending considerable money by putting in an extensive tailing flume. He intends to run a bed rock tunnel through his own claim, and others, so they can all tail into his main flume. This, in some sections of the country is a very profitable business, and I should think it ought to be in this case. I was glad to find one enterprising man from the Bay who thought there was a chance left yet, for profitable investment in California mines; and I am sure there are still many good chances if capitalists were only disposed to seek the opportunity.

COMMERCE HILL on the road to Brandy City, is of the same class of mining, on a rather large scale. I did not have a chance to stop, but was obliged to ride on to BRANDY CITY as fast as possible. This is said to be the principal hydraulic camp of Sierra County; at least it has had that reputation for some years past. At one time they used 3,000 inches of water, in piping claims. There were 12 claims; some using 500 inches. The lead is said to be 200 feet wide, and the supply of gravel still continues good. I had no opportunity of seeing, and can only judge from report of others. Our party were kindly attended to by Mr. Jones at the hotel, and after refreshing ourselves, we started down to Yuba River, on our way back to Camptonville.

Taking the stage from Camptonville I arrived in SAN JUAN NORTH, and found time to visit Manzanita Hill, to see the hydraulic claim of the AMERICAN COMPANY. I found everything working to good advantage, with three large pipes, with two to 2½ inch nozzles, and using about 600 inches of water in all. They are so rigged as to be able to wash a large quantity of dirt, and run day and night. I understand they stopped work when the ditch company put on an extra tariff for water. Their water is \$100 per day. The pipes are of heavy sheet iron; and the hose of three thicknesses of stout canvas. In this manner acres of ground, fre-

quently 100 to 200 feet deep, are washed in a season, and the bed rock left bare. The hills in front of the works are quite high. The gravel is very black in streaks, and some of it so hard that heavy sledges have to be used to break it. The sluices extend from the hill down to the middle Yuba, a distance of about a mile. They have several deep falls, with undercurrents, for breaking and washing the hard cement, and also have pans for grading the sand. They wash up every 20 days. I did not learn the results of the clean up, though they told me in the town that they were quite large. After cleaning the bed rock as well as possible, they sell, or lease it out to Chinamen, for a second washing up, and the Chinamen make good wages. CROOKS.

Bull Run District.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

EDS. PRESS.—Some additional items concerning this district may be of interest to many. The Monument mine, owned by Gov. Chellis and others, has its shaft down 50 feet and has struck some very rich ore. The vein crops out at the surface (from one to ten feet high) for at least 3,000 feet and locations have been made throughout its length. It is about 10 feet wide and the rich streak, alluded to above, is four feet wide and next to the hanging wall.

The Fifteenth Amendment has a tunnel 40 feet in on the ledge and in good ore. A new ledge was started here lately on the east side of the mountain, which is, I think, about the richest thing of the kind that has come under my observation. At the surface it was only two inches wide; 20 feet down it is 12 inches wide, and is continually getting wider. On each side there are about six inches of decomposed quartz, which probably will become a solid ledge lower down. The rock in the vein is of the same general character as in other mines here, but is almost *plotted* with native silver. It is also rich in chlorides and black sulphurets.

The Highland Queen has also some very rich ore on the dump. A tunnel is about to be started 50 feet below this ledge, which will cut it at a depth of 40 feet, and then will be carried in 400 feet further and cut the Sacramento lode at a depth of 350 feet. Both of these mines are owned by the owners of the tunnel which, running right across the main mineral belt of this district, promises to develop other ledges.

Several of the leading mines have been bonded to Col. Fogus at (I understand) a good figure. Among these are the Fifteenth Amendment, the Johnson, Ravine, Hope, Montana, Nevada, Norwich, Morning Star, etc.

There are thousands of tons of rock on the dumps waiting for mills to be erected. The value of the ores here has been fully tested by the many shipments, and if the miners can stick it out until the mills come, many will become rich. The facilities for milling are such that the ore can be reduced at as little expense as at any other point in the State. I do not profess to be an expert, yet I have been in almost all the districts of this State as a miner, from '63 to the present time; and I have never seen a camp with so much good ore in sight as is here.

Mr. H. M. Grant, hanker, of Mountain City, is buying ore and piling it up, thinking that mills will soon be brought here. By his action he helps the poor miner who needs such assistance, and will make a handsome profit himself.

Winter is approaching. We have already had one snow storm. But snow will not delay our underground operations, and, if I mistake not, there will be over 10,000 tons of milling ore ready for reduction next Spring, by the time mills will be able to get started. There are about four months of hard winter weather here, when all operations must be conducted under shelter.

BULL RUN MINER.

Oct. 24, 1870.

Action of Prussic Acid on Iron Solutions.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

The Germans call prussic acid *Blausaure*, because it produces a blue precipitate in certain iron solutions; but the following experiment undoubtedly proves that the prussic acid does not produce the color of that precipitate, since it can be made just as well without it. Prepare a saturated solution of green vitriol in water. Take four-sevenths parts of the above solution and treat it with nitric and sulphuric acids, until it is changed into the sulphate of peroxide of iron. Mix this with the remaining three-sevenths of the first solution, then add very gradually (to avoid its becoming heated) concentrated sulphuric acid, until a precipitate is formed. The result will be a beautiful blue precipitate, equal to Prussian blue. If water is added, the precipitate is dissolved and the color destroyed; but if the precipitate is separated from the acid and rubbed with phosphate of soda, we obtain a beautiful blue phosphate of iron, which will resist the action of water. In all these cases the acids, which possess no color, are by no means the cause of the blue color, but favor only the production of it, by depriving the mixed hydrates of protoxide and peroxide of iron of certain equivalents of water, and likewise by preventing the same from entering into a higher state of oxidation in the atmosphere. E. PIERCE.

Mechanical Progress.

FRISSON'S SOLAR ENGINE.—London *Engineering* for Oct. 14th contains an article by Capt. Frisson upon this subject, with a cut of a small solar engine just completed, intended as a present to the French Academy of Sciences. We quote a few paragraphs from the article: "Plans and descriptions of the mechanism by which the sun's radiant heat is concentrated, and of the steam generator which receives the concentrated heat. I shall be compelled, for some time, to withhold from publication. Experienced professional men will appreciate the motive, that of preventing enterprising persons from procuring patents for modifications. In connexion with the course thus deemed necessary, it will be proper to mention that I have in several instances, notably in the case of the screw propeller and the caloric engine, been prevented from perfecting my invention in consequence of conflicting privileges having in the mean time been granted to others. Regarding the solar engine, I avail myself of this opportunity to say that I shall not apply for any patent rights, and that it is my intention to devote the balance of my professional life almost exclusively to its completion. Hence my anxiety to guard against legal obstructions being interposed before perfection of detail shall have been measurably attained. Within a few years the entire engineering community of both hemispheres will be invited to take the matter in hand. In the mean time let us hope that no exclusive privileges may be granted tending to throw obstacles in the way of an unrestricted manufacture and introduction of the new motor wherever it may be applicable. ** The solar engine is composed of three distinct parts. The engine, the steam generator, and the mechanism by means of which the feeble intensity of the sun's rays is augmented to such a degree that the resulting temperature will exceed that of the lowest pressure of steam admissible in an efficient engine. As to the motor itself, it suffices to say, that it is essentially a modern steam engine utilizing, to the fullest extent, the mechanical energy of the steam generated by the concentric solar rays. Regarding the steam generator, it will only be necessary to state that it is not exposed to the action of fire, clinkers, or soot, and therefore can only suffer from the slow action of ordinary oxidation. We have lastly to consider the efficiency of the mechanism by means of which the solar heat is concentrated and the temperature raised above that of the water in the steam generator. Regarding this mechanism, it will be asked: is it costly? is it heavy and bulky so as to render transportation difficult? and finally, is it liable to derangement and expensive to keep in order? I answer: The cost is moderate. The weight is small. As to the bulk, this apparatus is composed of small parts readily put together. Regarding durability, the fact need only be pointed out that certain metals however thin, if kept dry, may be exposed to the sun's rays during an indefinite length of time without appreciable deterioration. Another question will be asked, whether the solar engine will answer as well on a large as it does on a small scale? The following reply will dispose of this query. It is not intended to enlarge in future, the size of the apparatus by means of which the solar intensity has been successfully concentrated and the temperature sufficiently elevated to generate steam for the engines which have been built. The maximum size adopted has been adequate to utilize the radiant heat of a sunbeam of 35 square feet section. The employment of an increased number of such structures will therefore be resorted to when greater power is wanted, as we increase the number of hands when we desire to perform an additional amount of work."

FOUR PRESS COPIES OF PRINT AT ONCE.—We have alluded to the new printing ink which may be copied together with the filling up in writing ink. The *R. R. Register* says of it: "We have seen specimens of a Road Manifest, partly printed in McIlvaine's Ink, and partly filled up with handwriting in Arnold's, with perfectly clear press copies accompanying. We have seen four press copies taken at once, from a page of matter printed with this ink, all as legible as the original. We have taken a press copy of a card advertisement printed some time ago, and the copy was clear and strong. An edition of such blanks sufficient for six months can be printed, and used day by day until exhausted, and the last one will copy as well as the first. Any color can be given to the new ink."

A NEW BINOCULAR MICROSCOPE.—In a paper read by Mr. Samuel Holmes, before the British Association, the author says that binoculars, as heretofore made, are optical deceptions, the second image being a distorted reflex of the first, and no stereoscopic effect being produced as is required. He describes a new instrument, free from these objections. We quote briefly: "Its construction is simple. For illustration, take a complete achromatic microscope, and imagine a clean vertical section to be made through the center of its optical parts and their supporting brasswork; now considering each half as the radius of a circle whose center is the focus of the object glass, by separating the halves at their upper end to the distance between the eyes we may observe binocularly any object that was in focus when closed as a single body. The binocular vision here provided is strictly natural, and therefore includes correct stereoscopic effect, both eyes being used under exactly the same conditions as when examining an object unassisted at the distance of distinct natural vision, for the two optic axes are directed to the same object, and have the same assistance as to magnifying power and illumination; and the relief, therefore, of an object of solidity must be absolute for quantity and correctness."

IRON MAKING IN ALABAMA.—The special correspondent of the *Scientific American* writes: "All on the railroad lines wherever I talked of iron or iron works, I heard of the Shelby Furnace, which was making 30 tons of iron a day, with 90 bushels of charcoal to the ton. As my readers are aware, this is a yield and a proportion unprecedented in the history of iron manufacture. ** The furnace is at Columbiana—a branch road runs out to it, owned by the Iron Co. The ore is a porous brown hematite, sometimes massive, and changing to what is called by the miners needle ore; frequently occurring in hollows in the masses, filled with a silicious substance resembling pumice stone, or furnace cinder. The furnace was built during the war, burned, and rebuilt two years ago by a New York Co. The ore-bed is inexhaustible. As originally built the furnace was 36 feet high. It is now 53 feet to charging point; has 12 feet hoshes, and tapers three-eighths of an inch to the foot from the hosh to 6 feet of the top. The hosh is 4 feet high; the hearth 6 feet high; 4 feet x 3½ feet at the bottom, and 4 x 4 at top. During the past six months they have made over 3,800 tons of iron with an average of 98½ bushels of charcoal to the ton. They made one day 31 tons of iron with 92 bushels to the ton. Their best week's work was 184½ tons. Their best day's run was: Lime, 10,080 lbs; ore, 113,400; coal, 2,772 bushels; yield, 71,050 pounds. ** In my opinion the great yield is due to the unusual height of the furnace and still more, perhaps, to the peculiar tractability of the ore. Hot blast is used, and the charcoal is made in ovens of capacity of 65 cords, and the yield is about 50 bushels to a cord."

BOOT-SEWING BY MACHINERY.—The New Haven correspondent of the *Iron Age* writes thus of a new and remarkable machine: "This machine is the last link in making boots by machinery, and really caps the shaft. It is well known that machine sewed boots present the grave objection of the absence of a welt, and the consequent impossibility of sewing on another sole when the first is worn out. Other objections, well known to the trade, present themselves. This machine is hardly susceptible of description, but it is sufficient to say that in sixty seconds the insole, welt and upper leather are sewed together. The outer sole is then put on, the operation is repeated, and the bottoming process is done. If the uppers are fitted to the lasts and the lasts ready for adjustment, this machine will finish a boot per minute! The strength of the sewing is such that the leather will tear before the seam will rip. This machine, which will mark an epoch of advancement in the shoe trade, is the invention of Dr. C. C. Crosby, of New Haven."

IMPROVED TREADLE MOTION.—A Vermont has patented a double treadle applicable to sewing machines &c., in which the motion of the feet is alternate, and there is no dead-point common to the two, so that one or the other will always start the machine. One footpiece is fastened to a rock shaft on which the other footpiece moves freely. An arm on the said shaft is at right angles to another arm on the last named footpiece; and each of these arms is connected by a pitman with the crank wrist.

Scientific Progress.

COLOR OF LAKE GENEVA.—Our readers will recollect some remarks upon this in a former number of the Press (April 2d), in which were given the diverse suggestions of two scientists as to the cause of the beautiful blue so often noted. In a late number of *Nature* (Oct. 29), Prof. Tyndall gives another and different explanation of it. He has just examined two bottles of the Lake water sent him by M. Soret. We quote: "The bottles, as they reached me, and with their stoppers unmoved, were placed in succession in the convergent beam of an electric lamp. Water optically homogeneous would have transmitted the beam without revealing its track. In such water the course of the light would be no more seen than in optically pure air. The cone of light, however, which traversed the liquid, was distinctly blue. Something, therefore, existed in the liquid which intercepted and scattered, in excess, the shorter waves of the beam. The longer waves were also scattered, but in proportions too scanty to render the track of the beam white. The action, in fact, was identical with that of the sky. ** Observation in 1857 impressed me with the notion that the blue was mainly that of a turbid medium. Soon afterwards I wrote thus: "This lake is simply an expansion of the river Rhone, which rushes from the end of the Rhone glacier. Numerous other streams join the Rhone right and left during its downward course, and these feeders being almost wholly derived from glaciers, carry with them the fine matter ground by the ice from the rocks over which it has passed. Particles of all sizes must be thus ground off, and I cannot help thinking that the finest of them must remain suspended in the lake throughout its entire length. ** It seems worthy of examination whether such particles do not contribute to that magnificent blue." The surmise of thirteen years ago has become the verity of to-day."

But though in the action of small particles we have a cause sufficient to produce the blueness referred to, it is not the only cause. In the Lake of Geneva we have not only the blue of scattering by small particles, but also the blue arising from true molecular absorption. Indeed, were it not for this, the light transmitted by a column of the water would be yellow, orange, or red, like the light of sunrise or sunset. Not only then is the light mainly blue from the first moment of its reflection from the minute particles, but the less refrangible elements which always accompany the blue are still further abstracted during the transmission of the scattered light. Through the action of both these causes, scattering and absorption, the intense and exceptional blueness both of the Lake of Geneva and the Mediterranean Sea is thus completely accounted for."

SCIENTIFIC ZEAL—ENGLISH AND AMERICAN.—*Nature* for Oct. 13th says: "We have great pleasure in announcing that the American Government have voted 6,000 for the expedition which will be sent to Spain and Sicily to observe the coming eclipse. It will be in the recollection of our readers that our own Government have refused to give either a single ship or a single shilling in aid of our own observations; as we said before, comment is useless."

PRESENT STATE OF THE MOON'S SURFACE.—W. R. Birt, F. R. S., read a paper upon this subject at the late meeting of the British Association. We quote briefly:—"Whatever may have taken place in the crater *Linæ*, from Schröter's time to the present, we have phenomena of a different character, exceedingly difficult of explanation, and constituting an important element in the solution of the question of present activity or quiescence; for unless it be fully proved that all these depend upon changes of visual and illuminating angles, a strong suspicion will exist of their being more immediately connected with the moon itself. To effect proof, however, is a matter of no small difficulty. Madler alludes to the performance of calculations of the most varied kind as necessary for the delineation of lunar forms, and the calculation of several elements for each separate observation is absolutely essential for the purpose of referring the phenomena to changes of illumination and visual ray. Calculations of this kind have not been made to any great extent, and the consequence is, that the entire question remains involved in doubt."

WALLACE ON NATURAL SELECTION.—In our last week's issue, under the head of "Nature in Wallace," we gave some quotations from that journal's notice of Mr. Wallace's book. In reference to Mr. W.'s belief that certain peculiarities of human development cannot be explained except as the result of the direct action of the Creator, —and *Nature's* assertion that such belief "confuses two distinct branches of inquiry," —we ventured a few remarks which, having been incorrectly printed, we here repeat:

"May we not be allowed to suggest, that although we have not seen Mr. Wallace's book, we believe his idea to be really this, viz: that the operation of the law of natural selection is, in man, essentially modified by his consciousness of the existence of a Supreme Creator. This consciousness causes him to be more or less *en rapport* with that Creator; and it is easy to see that (on the supposition that such Creator exists) man is therefore, so far, an exception to the rest of creation. Brain action, of whatever kind it may be, certainly modifies development; and here is an outside inducer of brain action, —an outside thought-provoker, —which no other organism has, because no other organism has reached the stage of development which makes such consciousness possible. In one sense, therefore, it may really be said to be the direct action of the Creator which makes the difference between human and brute development. This does not make the doctrine of natural selection any the less true, even in relation to man. On the contrary, it is, in our belief, quite possible, that the sooner scientists admit the existence of this modifying element, the sooner will the truth of that doctrine become clear to them, and all its seeming inconsistencies disappear."

EXPERIMENTS WITH GASES ON PLANTS.—We gave, a short time since, some experiments with anæsthetic agents upon plants, from the *Edinburgh New Philosophical Journal*. We now give, from the same journal, the summing-up paragraph of an article by J. S. Livingston F. R. S., detailing experiments upon plants with various gases:—"To conclude, then, it will be evident from the preceding experiments that gases divide themselves into two classes as regards their action on plants—viz., narcotic and irritant. This distinction is as real in the case of plants as in that of animals. When subjected to the influence of a narcotic gas, the plants looked as green and succulent at the end of the experiment as at the beginning. Whenever the plant began to droop, though removed to a forcing-bed, and watered, in no instance did it recover, but died down even more speedily than it would have done if left to the continued action of the gas. In one word, narcotic gases destroy the life of the plant. With irritant gases, on the other hand, the action is more of a local character. The tips of the leaves first begin to be altered in color, and the discoloration rapidly spreads over the whole leaf, and, if continued long enough, over the whole plant; but if removed before the stem has been attacked by the gas, the plants always recover—with, however, the loss of their leaves. In a short time they put out a new crop, and seem in no way permanently injured; but if repeatedly subjected to an atmosphere of irritant gas, the plants were destroyed."

TEST FOR STRYCHNIA.—The following is from the "Foreign Notices" in the *American Chemist*: Sonnenschein announces that oxide of cerium is an excellent reagent and test for strychnia. When the last-named substance is well moistened with concentrated sulphuric acid, and there is added to it a mixture of proto-sesquioxide of cerium, a very fine blue coloration ensues, which gradually verges to cherry red, and then remains unchanged, even for several days. The author states that, by this test, even so small a quantity of strychnia as 0.00001 grm. can be detected. Other alkaloids yield, with the same test, quite different reactions, as, for instance—brucine, orange, becoming at last yellow; morphine, olive-brown, finally brown; narcotine, first brownish, cherry-red, remaining at last cherry-red; quinine, pale yellow; cinchonine remains colorless.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

THE PROSPECTS.—*Miner*, Nov. 5th: Alpine has never seen the time before when her mines promised so well. The Leviathan has ore enough in sight to pay the owners back the amount invested, at the price it commands on the dump. The lower tunnel is in far enough to connect by winze with the ore deposit above. The Morning Star has a good body of ore at hand, but the owners don't seem to know what to do with it. The Schenectady will soon have the connecting shaft between upper and lower works finished, and ore sufficient to build a mill for, on the dump. The Monitor and North Western and Silver Glance Companies, owning ground on the Tarshish adjoining the Schenectady, have each large bodies of low grade ore in sight, and are running for the richer deposits indicated by the croppings and bearings from the mine adjoining. Across the creek and upon the continuation of Tarshish lode, the Globe Co. have a low grade ore which is considered of value sufficient to justify a mill. Across the river, in a line southwest from the Leviathan through the other mines, is the Exchequer, which is turning out ore, and for which a mill is now being completed.

One hundred tons ore, which will net over \$5,000, have been hauled in this week from the Leviathan, to be milled at Dayton.

The *Chronicle* hopes the Globe Co. will find enough ore of their own to keep their mill running when completed.

BLUTE COUNTY.

PROSPECTS.—The Oroville *Record* of the 12th thinks there is a good time coming. The success of the Spring Valley Water Co. in bringing water into Cherokee has aroused others. It is said that the Cherokee Co. are contemplating carrying water on to their claims, from a source that will furnish a never-failing supply, and have taken up the Middle Fork of Feather River. To get this to Cherokee, it would have to be carried over the North Fork, in pipe, and under a pressure equal to that of the Spring Valley Co. The effect upon the county will be two-fold. It will add greatly to the gold product, and send thousands of inches of water down Dry Creek to irrigate the valley.

PIPE LAYING.—The laying of the two and a-half miles of iron pipe for the Spring Valley Co. has been completed, and water has been let into the ditch above.

SUTRO TUNNEL NOWHERE.—The Cherokee Company's tunnel from Mesilla Valley to their claim, one and a-half mile, when completed, will drain placer diggings of more value than the whole Comstock lead.

INYO COUNTY.

SWANSEA.—*Independent*, Nov. 7th: The Owen's Lake Silver-Lead Furnace has just completed a run of 1298 bars, having started up on the 20th ult., and shut down on the 3rd inst. The bars average 89 lbs. in weight each, and for a time the works turned out 120 per day.

KEARSARGE.—Parties have been for two or three days cutting away the snow from the trail, it being four feet in depth at the mine, and three at the mill. Ore packing has been resumed and the mill will start up to-day.

LASSEN COUNTY.

BIG VALLEY.—*Yreka Journal*, Nov. 9th: The claim of Haskin, Ehlers & Co., still pays handsomely. A quartz ledge in the vicinity has been prospected, and found to pay rich for half a mile. The settlers think there will be a great rush to that section next spring.

RIVER MINING.—This has proven very successful this season, both in the Klamath and Scott Rivers. Klamath has been paying better than ever before, which is due to more extensive operations.

The Susanville *Sage Brush* says that about forty miners will winter in Big Valley. Two towns have been started, and one of them has a store already. What the other has is not stated.

MARIPOSA COUNTY.

COULTERVILLE.—*Gazette*, 11th: Mr. Douglass is repairing his quartz mill—putting in new battery blocks and making other improvements. The mill will be ready to start up in a few days. Mr. D. is still getting out rich rock from the "Melvina." After a two days run of P. Winant's quartz mill, on rock from the "Eclipse," the clean up showed \$3,000.

NEVADA COUNTY.

EMPIRE MINE.—*Transcript*, Nov. 9th: The pumps will be started to-day, and it will require several weeks to get the water out. The foundation of the new mill has been laid, and works will be in full operation by the first of January.

CLAIMS PURCHASED.—We learn that a Chinese Co. has purchased a set of mining claims on Greenhorn for \$3,000. They intend to put thirty men to work.

FIDELITY.—Same of 10th: The ten stamp mill on the Fidelity mine, above Washington, completed some time ago, has been crushing rock and flatter returns have been received.

GOLD FLAT.—Same of 12th: There are quite a number of new locations in quartz and excellent developments have already been made. The Orleans is looking first rate. The Manhattan is giving evidence of richness, and other ledges show well in gold and sulphurets.

WYOMING.—*Gazette*, 8th: About 200 tons of rock recently taken from the ledge, on Wood's ravine, is to be crushed at the old Sogg's mill. The ore now on hand will yield \$45 a ton. A quantity has yielded \$68 a ton.

STAR.—Same of 14th: We learn that the mill and mines have been leased for two years to a company of practical miners. The latter give twenty per cent. of the gross proceeds of all the rock crushed.

NORTH STAR.—*Grass Valley Union*, 9th: Monday Mr. Hoyt, Supt. shipped to San Francisco \$18,000 worth of gold. This was the proceeds of the mill since the 16th of October.

EMPIRE.—In spite of wind and weather, reconstruction goes on. The hoisting works have the engine and are covered in. Work for the mill building is done under a large shed. Wood is being hauled and in a few days there will be a supply on hand.

HOPE GRAVEL.—Same of 12th: Last week this Co. cleaned up 68 ounces of gold dust. This week, the run will be much increased. The underground of the mine is looking as well as ever.

Same of the 15th says of the Hope Gravel: This Co. cleaned last week, washing 92 ounces of gold, which is worth \$17.25 per ounce, in Grass Valley. This yield was from four picks, working two shifts of ten hours each. This yield is in addition to a large amount of cement delivered on the surface and piled up for milliner. An eight stamp mill is to be put up immediately, to be employed in crushing the rich cement.

PLACER COUNTY.

DUTCH FLAT.—*Stars and Stripes*, Nov. 10th: James Teaff made his start as the owner of an incumbered part interest in the old Franklin claims. These were consolidated with the Wallamaloo claims, and out of the profits and with other funds borrowed, he gradually absorbed the interests of his partners, and acquired adjoining claims, until he is now sole owner of the Little Hope, Railroad and St. Nicholas or Minshrush, Dutch Flat Water Co., Franklin and Wallamaloo, comprising a solid body, running from the cañon to Bear River, in the heart of Dutch Flat, and embracing over forty acres of mining ground. He has, at great expense, tunneled through the bottom of the red gravel and sunk a shaft over 100 feet, through the blue gravel to the bed rock; thereby demonstrating that the blue gravel is the richest of all the strata.

PLUMAS COUNTY.

QUARTZ MILL.—*Quincy National*, Nov. 5th: Messrs. Concklin & Ray have a force of men at Argentine, putting up machinery to crush the quartz from the lode purchased. Their mill will be capable of crushing thirty tons per day.

SAN BERNARDINO COUNTY.

BLACK HAWK DISTRICT.—*Guardian*, Nov. 5th: Dr. Brink made a fire assay of 14 ounces of argentiferous rock. The result was six and three-quarter ounces of base bullion, which assayed \$495 of silver, 10 per cent. of copper, 60 per cent. of lead, with a trace of gold. The rock was 15 feet from the surface out of the Lady Fuller and Ingot ledges. The shaft is on the dividing line. The Black Hawk ledge assays \$39 16 in silver, and 56 per cent. copper per ton.

SIERRA COUNTY.

The Butte *Record* of the 12th says the chunk found at Fir Cip (mentioned in our issue of Nov. 5th) was worth \$3,100.

SISKIYOU COUNTY.

SOLD.—*Yreka Union*, Nov. 9th: Frank Dean and Thos. Keating have sold their claim in the Klamath River below the mouth of Scott. The claim had yielded during the four or five weeks prior, six or seven thousand dollars, and they owned

one-half. The purchasers were Varney and Nesbit.

TRINITY COUNTY.

The *Journal* of Nov. 12th says THE DEEP SHAFT is down 145 feet. During the week the workmen found about one-half gravel and one-half granite. Large pieces of wood are unearthed.

Nevada.

ESMERALDA.

RICH ORE FROM THE DUNDERBERG.—*Gold Hill News*, Nov. 8th: We were shown yesterday about 100 pounds of ore from this famous mine. Such rich ore is seldom seen. It was "lonsy" with flecks and scales of native silver and gold, and of a porous character, easy to work. The ledge is over 60 feet thick between walls, and the rich pay streak six feet.

HUMBOLDT.

RAILROAD DISTRICT.—*Elko Independent*, Nov. 9th: The Railroad Furnace is shipping bullion to San Francisco constantly. The Bullion mine has struck a vein at the bottom of the shaft which is said to be very rich. Franks has struck a three-foot vein. The Elko Smelting works shipped ten tons of bullion East a few days ago. It was from Railroad district and Salt Lake.

REESE RIVER.

BULLION.—*Reveille*, 7th: During the past two days the Manhattan Co. of this city shipped through Wells, Fargo & Co., 17 bars of bullion, weighing 1,572 pounds and valued at \$26,173.

MINERAL HILL.—*Independent*, 12th: Judge Bartlett fur is a flattering description of the mines and prospects. Money is more plentiful, and business improving. The population is increasing every day.

WASHOE.

YELLOW JACKET.—*Gold Hill News*, Nov. 12th: Daily yield 140 tons, from between the 800 and 1,000-foot levels. Some very rich ore from the north winze between the 900 and 1,000-foot levels. This winze is 57 feet deep and in very high grade ore all the way. The face of the drift is now so close to its connection with south winze that the workmen from each side can hear each other.

SAVAGE.—Daily yield 80 tons. The ore breasts of the eighth level hold out well. The body near the Gould & Curry line, in the upper mine, is not yielding so well. The new body south of it is looking well, and is eight feet wide.

CROWN POINT.—Daily yield 60 tons, from the old west workings of the upper mine. The incline is down 118 feet below the 1,100-foot level, and the bottom is in barren quartz. The 600-foot level is being reopened, but the gas is so bad that none of the ore has yet been extracted.

IMPERIAL EMPIRE.—The drifts at the 1,300-foot level show no change. The west is in porphyry, with streaks of quartz, and the east shows all quartz in the face, which gives low assays. The upper levels of the old Imperial are yielding 60 tons of fair ore daily.

HALE & NORCROSS.—Daily yield 175 tons. The drift east from 1,300-foot level is about cutting the vein. The ore breasts between the sixth and seventh levels give the principal yield.

OCCIDENTAL.—The new mill is rented to Sweetapple, who is running it on ore from the lower tunnel. A compromise is about effected with those having claims against the Co., and the prospects are that this mine will soon be brought into shape.

CHOLLAR-POTOSI.—Daily yield 275 tons. On Thursday a dividend of \$4 per share was disbursed, aggregating \$112,000.

OVERMAN.—During the past month 1,765 tons of ore were crushed, yielding \$37,653. No new developments.

SIERRA NEVADA.—The last 15 days' run of the mill cleaned up over \$31,000.

CALEDONIA.—The Pinto and Sapphire mills are running on ore from the mine, the 300-foot level of which yields the best, and shows improvement. October receipts, \$31,000.

SACRAMENTO AND MEREDITH.—Still maintaining the yield from the upper portion, and the mill running with satisfactory results.

GOULD & CURRY.—Daily yield 70 tons. No change to note, and no new developments at the lowest level.

BELCHER.—The raise above the 200-foot level gives a small quantity of pay ore.

ORHUR.—Nothing new except the assessment of \$2 per share.

SEGREGATED BELCHER.—*Enterprise*, Nov. 13th: The east deposit steadily improves in going toward the Belcher line. They are

now retimbering 150 feet of their main shaft. The Eureka mill, on the Carson, will start up about the 1st December on ore from the mine.

DANEY.—The engine shaft is being sunk to a depth of 267 feet. On the 10th inst. a contract was let to continue to the depth of 300 feet, at which point a drift will be started for the vein. With speed the shaft will be completed within 20 days. The machinery and pump are working finely.

SAVAGE.—The main shaft for a new level is down 30 feet below the present. The daily yield 80 tons, mostly from the eighth level.

VIRGINIA CONSOLIDATED.—The drift west is steadily progressing. The face of the tunnel is now in rock so soft that it can easily be worked with a pick.

SUTRO TUNNEL.—The tunnel was in yesterday 1,654 feet. The ground is good and good progress is being made. Water about the same.

Virginia telegram, Nov. 15th.—All the mills along Seven Cañon are in full blast upon ore from Cedar Hill and the Comstock.

Wells, Fargo & Co. ship to-night thirty-three bars of bullion, valued at \$67,741.

WHITE PINE.

The *News* of Nov. 13th says:—During the week another English company bought a large mining interest in Troy District, and we understand that work will be commenced in a short time. South Aurora M. Co. has been incorporated in London, with a capital of £300,000.

ITEMS.—ORIGINAL HIDDEN TREASURE is looking well. A large body of medium ore in sight and a force of men are taking it out. Some high grade ore is in view. The mine is being put in good shape. . . . SILVER WAVE shows good ore in the west drift, near the Montauk ground. There is some good ore in the northeast drift toward the Hidden Treasure. . . . MAMMOTH has three men at work in a tunnel, prospecting the east side of the claim. . . . EBERHARDT is taking out sufficient first class ore to keep the Oasis mill, steadily employed. Part of the force is prospecting. We hear of another rich strike in the bottom of the old Defiance shaft. . . . IN ATLANTA CONSOLIDATED, the English Co., is working a small force, taking out fair ore. In the Earl, two shafts are being sunk. One of them is in good ore. . . . ANCHOR is working day and night with a full force. The mine is yielding first-class ore. . . . WARN BEECHER—reported sold to the English Co., two or three times, is still in the hands of Mr. Roberts. We understand that red tape has been retarding the sale. The mine looks as well as ever. The second class ore, worked last month, averaged \$75 per ton. The first class which has been sacked and stored will go up in the hundreds.

BASE METAL RANGE.—The claims reported last week, are all still at work. The Jennie A. keeps the Hamilton furnaces running; 16 men can take out more ore than the furnaces can reduce. . . . Gov. Matteson's four mines are yielding good ore.

MILLS AND FURNACES.—The International mill has been retarded a little for want of lumber from Elko. The engine and battery beds are now being put in. . . . The Monte Christo has been stopped until it is known what course the Eastern owners intend to pursue. The Stetefeldt furnace gave excellent results. The only trouble is that the crushing capacity of the mill is not large enough for the capacity of the furnace. . . . Matteson's Furnace, No. 3, has been started, and is running finely. The other two after running over 60 days, have been stopped for new linings. The castings and machinery for the separating works are nearly all in place.

ROW IN PROCURE.—The *Ely Record* says:—A dispute between parties for possession of the Banner and Creole mines culminated in a pitched battle on Wednesday (9th) in which W. G. Snell was killed and ten men wounded. The Creole retained possession. The leaders were arrested and bailed.

Arizona.

BRADSHAW DISTRICT.—*Prescott Miner*, Nov. 5th: McCracken, Taylor & Co., returned a few days ago, with 116 ounces of gold, worth \$17 per ounce, which they had just worked out of 20 tons of ore from the Del Pasco lode. They assure us that half the ore crushed, was below second class. Several other persons report rich ledges and good placers.

BIG BUTTE.—The Company's 10-stamp mill is at work, and a large force are taking ore from the mine.

WALKER.—Messrs. Pointer and Shelton came down Thursday. They say the recent rains helped miners. Several were making fair wages.

HASSAYAMPA.—The placer miners in the creek claims are doing well.

WICKENBURG.—Both mills are running, the Vulture company's on ore from the Vulture lode; the other on ore from the Mayflower.

WALNUT GROVE.—Same of Oct. 29th: The Rainbow Lode is worked by Henry, Wainwright, and others. The incline shaft is over 20 feet deep; ledge six feet thick, four of which are of pay rock. The ore has paid as high as \$150 to the ton. Several tons, which will go \$100 are being crushed in arrastras.

Colorado.

ITEMS.—Central City *Register*, Nov. 9:—Three tons ore from the east end of the Conley lode, by Mr. Teats' sons, assayed between six and

seven hundred ounces per ton. The "Devil's Grip" is run at Kimber's mill 16 ounces per ton.

GRAND ISLAND.—Walker & Rollins have discovered a lode in which the crevice at fifteen feet deep is thirteen feet wide, and an average assay of the ore without selection was 32 oz. per ton. Rich ore has been struck in the "Sovereign People." Ewers, Dunnigan & Co., are working the "La Pearle" and have a four foot crevice at a depth of twenty feet. Hinds & Co. are still working the Trojan, upon which the ore is increasing in richness with every foot sunk. Stowe & Co. have developed a rich lode eighty rods north of "La Pearle."

GEORGETOWN.—*Miner*, Nov. 10th: Samples of the ore in the Bason lode, cut by a tunnel last week, run \$440 per ton. We were shown a fine specimen of native silver from the Cashier lode. A new discovery on Leavenworth mountain, by Williams and Walker, called the Simpson lode, carries three to four inches of good mineral. Washington lode shaft is forty feet in depth. The mineral assays 600 to 900 ounces per ton. The last lot of Dives ore treated, ran \$140 per ton. The Junction lode crevice is eight feet wide, and the pay vein eight inches thick. Assays as high as \$7,500 per ton have been obtained, and the whole vein will average 500 ounces per ton. Good pay struck in the Ocean Wave. Eight inches of the vein will run \$500 per ton. The Pine Co. will work the Belmont mine this winter. The last lot gave \$113 per ton. The Stewart works in six weeks turned out \$31,000 from 334 tons ore from 46 different lodes. The average, \$118 per ton, may therefore be taken as an average value of those of our ores which are treated at home. The ore from the Mendota is rich in both silver and lead, the first class running 250 to 300 ounces of silver to the ton, and the second 80 to 100 ounces.

TERRELL.—During the last seven months the Terrell mine has shipped over 70 tons of first class ore and not, as has been reported, 19½ tons in ten months. The mine is now in good shape, and the monthly returns are increasing. The average value of the ore is 500 ounces per ton for first class, and 120 and 60 ounces for second and third.

Idaho.

ITEM 4.—*Avaanche*, Nov. 5th: The Illinois Central is still taking out fine looking ore. The vein is 15 inches—in some places wider. They have stoped out for 30 feet south of the shaft, and have on dump and at the Minear mill 100 tons. A new lode, the "Belgium," in which are interested J. Schmidt, Sam. Benge and others, a short distance east of the Oro Fino, is eight inches in width. One assay of the ore yielded \$892 per ton—\$60 in gold and the remainder silver. Another, pounded in a mortar, yielded \$600. Parties are sinking on the vein. Work on the Red Mountain progresses, and the ore is worked at the Webfoot mill. A three-foot ledge of splendid ore has been struck in the Mahogany mine. The Skookum boys are working their ore at their own anastax, and at the Minear mill. The Oro Fino is clear of water, and will soon be lively. Supt. Hyde, of the Peck & Porter, is having a splendid ore house erected, and the timbers are on the ground for the hoisting works.

MILLS.—Seven steam quartz mills are now at work—the Ida Elmore, Owyee, Cosmos, Webfoot, Shoenbar, Minear, and Black's mill in Flint. There are also two anastax grinding night and day, and the mill at Fairview will soon be ready.

BULLION.—Wells, Fargo & Co. shipped this week 14 bars of bullion, valued at \$28,350 48.

ALTURAS.—*Boise News*, Nov. 5th: The anastax are making handsome clean-ups. The Casco Co. mill and mine are in the hands of Mr. McNally, and running on custom rock. The people are jubilant over the sale of the Atlanta mine. Letters from Dr. Bishop state that the first payment of \$85,000 was made in London on the 15th of Oct.; the whole amount, \$850,000, will be paid by 1st of January. The same parties have negotiated the sale of the Lucy mine.

LEHIGH COUNTY.—Quile a number of people will winter at Loon Creek. Good prospects have been found on the South Fork of Salmon River. The mines at Leesburg are paying better than ever; new discoveries are continually made. The Moose Creek mines promise well for next season.

SNAKE RIVER.—The *Elko Chronicle*, of the 10th says: Capt. Ralph Bledsoe writes Oct. 30, to E. Burner of this place, that they have struck gravel in their claim. It is four feet deep and prospects splendidly: He thinks they took out \$103 the day before, in their sluices.

Montana.

HIGHLAND.—*Montanian*, Nov. 3d: The anastax at Red Mountain City have done exceedingly well this year. The owners of the "Only Chance" have filled their coffers. In Vipond District, several new silver lodes have been discovered. Mr. Puloin has sent five tons of the ore to California, and five to Europe for reduction, as a test.

FLINT CREEK.—Mr. Garher informs us that the miners are keeping their lick up. Colo Saunders is running two silver furnaces.

WASHINGTON.—Cor. of *Helena Herald*, Nov. 10th: Four claims have been laid out until spring. Sloan, Davidson & Co. will return next season to operate in Last Chance and on Stony Bar. The Hardscrabble Flumming Co. have got their claim well opened. A pipe will be put on next season. Stiles, Bingham & Co. are making their two hydraulics scatter the bank, and realizing good pay. Their ground

will last for years. A company from Virginia City have commenced prospecting Meadow Creek proper. The high bedrock, prospects exceedingly well. Parker & Co. have commenced putting in a ditch from Meadow Creek. Parkinson, James & Co., and the S. C. Mining Co. are taking out good money.

QUARTZ CREEK.—*Mission Pioneer*, Nov. 3d: This creek, twelve miles above the Head of Cedar, was discovered two months ago, since which time nine miles has been staked off. John Harrington is working discovery claim in the shallow ground, near the mouth of the creek. Out of this \$10 to the pan has been taken from the crevices of the bed rock. No. 1 below averages \$15 per day to the hand. Several other claims were paying but the future of the camp depends upon the deep diggings above the town. O'Brien, Johnson & Co. have a wheel and pump. The company expect to reach bed-rock in a short time.

CEDAR.—Forest City Cor. of Same: On Nos. 76 to 80, ground considered worthless has been re-located and good pay struck. McDougall, Miller & Co., on No. 68, after working all spring and summer, have at last got the streak; have paid the debts, and are making money. Smalley & Co., who bought 200 feet of ground from Sullivan & Hollering, have paid the last installment of \$3,000. The ground was purchased for \$7,000. Hickey, Lampoy & Co., of No. 60 are working day and night, and are certain to make big money. Palmer, Kelly & Co., have reached bed-rock in a 65-foot shaft, and are laying their lums. The claim prospects 10 cents to \$2 to the pan. Watkins & Co., No. 58, have run 200 feet through pay dirt. A one-third interest in this claim was sold for \$4,000.

Utah.

NEW SMELTING WORKS.—Salt Lake *Herald*, Nov. 11th: Colonel David E. Buel, formerly of Nevada, but now of this city, is having extensive smelting works put up for Bateman & Co. in which he is interested—at the mouth of Little Cottonwood canon, fifteen miles from this city. The works will be ready to run in about five weeks.

NEW DISCOVERIES.—By private sources we learn that rich mineral discoveries are reported forty miles south-west of Stockton.

TINTIC ITEMS.—*Tribune* Nov. 5th:—The Swanson is down 80 ft. with a 5-ft. vein of rich mineral. The Sunbeam ledge is to be let to the Ogden Co. for development. The ledges near Diamond city assay and prospect well. The Jenny Lind and Farmington ledges look well. The old Mammoth still ships ores. Recent assays give \$250, per ton in silver, copper, and lead. It is reported that Worsley & Co. have struck horn silver.

BATTLES OF THE MINE.—During the past week; we regret to say, accounts of two contests between mining-property owners have reached us. The dispute for the possession of the Banner and Creole mines, at Pioche, Nevada, culminated in a fight, on the 9th, in which one man was killed, and twelve wounded. Again, an underground fight was reported as in progress between the men of the Overmen and those of the Caledonia companies at Washoo, on account of disputed territory.

NEW MEXICO COAL.—In addition to the other sources of wealth which give so much promise for the future of our Territory, coal in abundance has been found on the Maxwell Grant. In the Raton mountains, along Red River and on the Vermejo there are large and distinct beds, some of which are ten feet thick or in depth. The coal is bituminous, and of the best quality to be found on the continent.

Also on Póñiel creek large veins crop out all along its mountainous course, whose quality excellent judges pronounce unsurpassable.

Along the Cimarron River there are also well defined evidences of large coal beds but as yet the company have not had time to open them. Indeed, the entire Grant is permeated with beds of coal, which crop out at different places. The blacksmith at Cimarron uses it for all his purposes, and says it answers as well as charcoal. A family residing near Cimarron use it for cooking purposes, and they too say that its quality is excellent, and they prefer it to wood. —*Cimarron News*.

GLACIERS IN THE VALLEY OF THE AMAZON

—The *American Chemist* has the following among its abstracts of papers read at the Troy meeting of the American Association: "Prof. Orton, of Vassar College, read a paper of absorbing interest, on the evidences of a glacial period at the equator. This conclusive paper gives the final stroke to the hasty theory of Agassiz, who inferred rather than proved the existence of a glacier in the Amazon valley. Prof. Orton now exhibits in great quantity marine and brackish-water fossils from that valley, showing its strata to be not a glacial, but an estuary deposit. The specimens were examined with much attention by the paleontologists present, and but one opinion was expressed concerning them."

Mining Stocks.

SAN FRANCISCO, THURSDAY EVE., NOV. 17.

The mining share market has been rather weak of late, and less business has been transacted this week than during the preceding one. Small amounts of Amador have been in the market selling at from 217½ to 215. Belcher has been steady. Chollar-Potosi has varied from 76½ to 81 and Crown Point from 2½ to 3½.

Some 300 shares of Daney have been taken at 3 and 3½ after sales had ceased for some little time. Golden Chariot has varied from 59½ to 64. Hale & Norcross from 114 to 99. The receipts of this latter company are given as \$116,766 for October, a decrease of \$9,203 from September. The Golden Chariot declared a dividend of \$3 per share payable on Monday. A few shares of Ida Elmore have been taken at 13 and 13½.

Quite a number of sales of Mammoth have been effected at 23 to 30c. Meadow Valley has been in fair demand at 25 to 22. Ophir commenced quite strong at 4½, getting weaker afterwards. The largest demand has been for Original Hidden Treasure, Savage and Yellow Jacket, all of which have been quite steady.

The annual meeting of the Confidence mining company was held last Friday, when the old officers were re-elected. Nothing had been done at the mine during the last year.

According to the S. F. Weekly Stock report, twenty-four dividends have been paid by the Union Pacific Salt Company since its organization in April, 1863, amounting to about \$32,000. The amount paid in and accumulated capital reach about \$160,000, and the sales for 1869 were over \$200,000. The stock is held at \$70 per share. The capital of the Company is \$300,000.

It is claimed that the comparison between the working expenses of the Eureka and North Star mines, which we took from the *Bulletin* last week, was unfair, because there was not given in the same connection the dissimilar conditions of the mines. It is said that the ledge at the Eureka is slate formation, nearly perpendicular, with frequent fissures of quartz, and hence can be easily, economically and rapidly worked. The North Star is granite formation and the ledge irregular, sometimes flat and sometimes dipping; hence it is necessarily more difficult to work, and therefore more expensive.

The Meadow Valley mining company report their receipts for October as \$162,642, of which \$60,000 was paid in its dividend declared for that month, and \$47,000 carried over. The yield during the first nine days in this month is given as \$31,700.

DANA'S System of Mineralogy. New Edition. 8vo. cloth. 10 00	
DANA'S Manual of Mineralogy. Revised edition, 1863. 10 00	
ELDERHORST'S Blow-pipe.—Analysis and Determinative Mineralogy. Third edition, revised. 8vo. cloth. Philadelphia, 1866. 3 00	
FEUCHTWANGER.—Treatise on Gems. 6 00	
GOODYEAR'S Translation. A Treatise on the Assaying of Copper, Silver, Lead, Gold and Mercury. From the German of Th. Bodenau and Bruno Kern. 1 vol. 12mo. cloth. 2 10	
HITTELS (JOHN S.)—Resources of California; comprising Agriculture, Mining, Geography, Climate, Commerce, etc. etc. 1 The Past and Future Development of the State. 12mo. cloth. 1 50	
HOSKOLD'S Practical Treatise on Mining Land and Railway Surveying, Engineering, Etc. 1 vol. 8vo. cloth. 16 00	
KUSTEL (G.)—Roasting of Gold and Silver Ores and the extraction of their respective metals without quicksilver. Illustrated with numerous woodcuts. 49 pp. Published by Dwyer & Co. 1870. 2 50	
KUSTEL.—Nevada and California Processes of Silver and Gold Extraction, for general use, and especially for the Mining Public of Nevada and Nevada also, a description of the General Metallurgy of Silver Ores. By Guido Kustel, Mining Engineer. Illustrated by accurate engraving. 1 vol. 8vo. cloth. 5 00	
KUSTEL.—A Treatise on Concentration of all kinds of Ores; including the classification of ores for gold bearing sulphurets, Arsenides, and Gold and Silver Ores generally. By Guido Kustel, Mining Engineer and Metallurgist. Illustrated with 120 engravings on 7 plates. 1 vol. 8vo. cloth. 7 50	
LAYRES (A.)—Elements of Composition (for schools or self instruction). 166 pp. Cloth. 1 00	
LAMBORN.—Rudimentary Treatise on the Metallurgy of Copper. 1 vol. 12mo. 11 pp. cloth. Illustrated. 1 00	
MITCHELL'S Manual of Practical Assaying. 1 vol. 8vo. cloth. New edition. 12 00	
MAKINS.—A Manual of Metallurgy, more particularly of the Precious Metals, including the Methods of Assaying them. By H. H. Makins. 12mo. cloth. Illustrated by upwards of 50 engravings. 5 00	
OVERMAN'S Metallurgy. 5 00	
PHILLIPS (J. ARTHUR)—Mining and Metallurgy of Gold and Silver. New edition. 14 00	
PERCY (John).—Metallurgy; the Art of Extracting Metals from their ores, and adapting them to various purposes of Manufacture. 1 vol. 8vo. cloth. 13 50	
ROWLANDSON (THOS.)—Treatise on Earthquake Damages, Causes and Remedies. 16 pp. pamphlet. 8. F. 1859. Postage free. 60	
SCOFFERN'S Useful Metals and their Alloys. 1 vol. cloth. 5 50	
SIMONIN, L.—Underground Life; or, Mines and Miners. Edited by H. W. Barstow, F. R. S. 160 wood engravings, 20 maps (colored), and 10 plates of metal and minerals in chromo-lithography. 18 00	
URE'S Dictionary of Arts, Manufactures, and Mines. 2,300 Engravings. From last London edition. 3 vols. 8vo. cloth. New York. 18 00	
WHEELER & RANDALL'S Quartz Operator's Handbook. Flexible cloth. 12mo. San Francisco 1868. 1 00	
WHITNEY.—A Geological Survey of California. Report of Field Work from 1850 to 1861. By J. D. Whitney. Per. vol. quarto. 6 00	
YALE'S Mining Claims and Water Rights. 8vo. cloth. 7 50	

Any of the above Books will be furnished by return mail or express, on receipt of price, in coin, postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices. Address,

DEWEY & CO.

Scientific Press Office, San Francisco.

SCIENTIFIC PRESS, FROM SAN FRANCISCO This Mining, Farming and Mechanic Arts Journal, after a most singular absence from our table, has again made its appearance and is heartily welcomed. It is the recognized mining organ of the Pacific coast, and rightly so, since it is conducted ably and honestly in all respects. It scours humbug and avoids all merely speculative commendations of sudden discoveries in the treatment of ores. The reliability of the Press in all matters pertaining to mines and mining news, makes it a most desirable paper for our people here. Per annum, \$4—*Colorado Herald*, July 6th.

What it Costs to Commence Farming.

In our last we endeavored to show that a person without either *means* or *experience* might commence farming with only a moderate outlay of time and labor; to day we propose to show what it will cost a person, who *has* means, to commence farming with the least possible delay.

We will suppose that the enquirer has made up his mind to enter upon the business of farming at the earliest possible moment. Although he may have means, it is still proper that he should economize them to the best advantage. If he has means to both buy his land and stock his farm, it would probably be better that he should seek out a piece of partially improved land. Of course the nearer to a market or railroad, or steam navigation, the higher price he will have to pay. If he has only means sufficient to stock his farm, he will either hire a piece of improved property, or look for government land; any quantity of which, and that of a good quality, he can find in almost every direction. In either case the choice of locality will, in a great measure depend upon the kind of farming in which he proposes to embark. If he proposes to undertake diversified farming, (that which is most needed here,) he would probably do well to go north, say into the Russian river valley, where the rain-fall is more uniform and reliable. The railroad in process of construction in that direction, is just now attracting much attention that way. Still there are innumerable other valleys, large and small, all over the State, where he cannot fail to do well, if he is willing to work hard and live prudently.

The cost of commencing a farm of course varies greatly with the nature of the work proposed and the extent of the ground to be occupied; but a scale can be given for any particular class of business, which can be adjusted to any desirable quantity of land. We propose to-day, to make an estimate for a wheat farm, and will locate it somewhere in the San Joaquin valley, where it will cost \$3 per ton to deliver the wheat at a railroad station or steam boat landing. If the land is level and easily worked, one man and a boy can do all the work, except harvesting and threshing, on 225 acres—200 of which might be devoted directly to wheat culture, and 25 to hay and other produce for stock and family, for house, barns, garden, orchard, etc. The wheat land should be divided into three portions, one of which should be alternately left for summer fallow—leaving 133 acres for sowing each year.

The price of such a farm, capable of producing an average of 30 bushels to the acre, ought not to exceed, at the outside, \$25 per acre, or \$6,250 in the aggregate, with a comfortable dwelling house, barn, out-houses and reasonable fence improvements.

In setting off the 25 acres for supporting stock, that part devoted to hay might be selected from the most unpromising portion of the wheat field, that which may become lodged, or otherwise unfitted for the ready action of the header—this year in one or sundry places, next year in other localities. We are not now talking of *careful* farming; but are making the most from a large tract of land, with the least labor and outlay, for two or three years, hoping to introduce a better system of farming at the end of that time. The stock and tools required may be set down about as follows:

Five horses, from \$60 to \$100 each, say.....	\$400 00
One heavy farm wagon, (four horses).....	250 00
One light wagon, (two seats).....	150 00
Two sets of heavy harness, \$25 each.....	125 00
Two sets of light harness, \$30 each.....	120 00
Blankets, etc., for horses.....	20 00
One silkeny plow.....	80 00
One harrow, \$20; Wheelbarrow, \$5; Shovels, \$5.....	30 00
Spade, \$3; pick, \$1.50; axes, \$8.....	12 50
One wood saw, \$2; hoes, \$3; hay forks, \$5; grind-stone, \$5.....	15 00
Crow bar \$2.00; Scythe, \$2.50; small tools for-car-pentry, etc., etc., \$4.00.....	25 00
Two cows (get good ones).....	100 00
One good breeding sow, say.....	60 00
Three geese and a gander, (if water is handy).....	4 50
8 x h m turkeys and a tom.....	12 00
Ten hens (get good ones).....	10 00

\$1,394 00

The poultry department (merely enough

to start with is set down,) if well managed, will prove the most profitable of anything on the farm, as it will do much towards supplying the table, and if near a market, may soon be made to pay a handsome revenue. More than that a good stock of poultry always gladdens and graces either a farm house or cottage. We have set down only two cows, just enough to furnish an abundant supply of milk, butter and cheese for the family. If the family is large, and there is a girl to take some of the care from the lady of the house, the number of cows might be increased and made an important source of revenue, provided care is taken to keep up a supply of green food through most of the summer. A small sum should, perhaps, be added to the above for dairy utensils, although that more properly belongs to the household furniture, which we have not taken into account, and the outlay for which must depend on the taste and means of the family. A very little can be made to answer, if need for economy exists. This outlay, added to that requisite for stocking the farm need not exceed, \$1,600 or \$1,800. An ingenious man may, with a few tools, make many little things which are needed about a farm, and should also be able to do much about repairing his tools, houses, fences, etc., and in keeping them in order.

We have made no allowance for thresher or harvester, as we propose to have the work of such machines done by the job, (although the best way is for several farmers to unite in the purchase of the necessary machinery for that work and assist each other.) We will endeavor next week to show what amount of profit may be derived from such a farm as we have supposed.

Fruit Growing in the Mountains.

How Mining Counties may Again Become Prosperous.

EDS. PRESS.—The weather during the past Summer and Autumn has been unusually hot, and less rain has fallen since the 21st of May than during any other summer since 1849, one shower only (Aug. 16) having condescended to lay the dust, and cool the atmosphere, for more than five months. But on Saturday last the clouds thickened, the wind shifted to the southeast and at 12 o'clock m., a genial shower commenced, and rain descended upon the just (if there are such) and the unjust alike, much to the joy of all. Sufficient rain fell during the afternoon and night, to wash the dust from the foliage and fences, and the vineyards and orchards now wear a more pleasing aspect. The streams are unusually low, water scarce, and mining prosecuted only to a limited extent.

The Pochontas quartz claim, near Mud Springs, I am informed by one of the owners, cleaned up after a run of some 13 days, more than \$10,000. This is probably one of the best mines in the State, and if properly managed, will pay enormous dividends to the owners. The Shepard mine in this city continues to yield rock fit for milling; but the actual product, I am unable to give. A few hydraulic claims are worked with success, in this vicinity, and preparations are being made for mining on an extensive scale, when water can be obtained. The interest the Press is taking in agriculture, induces me to give you some facts and figures, of the production of fruit raised in this vicinity and county.

There has been for the last ninety days 38 four-horse teams, most of them with thorough-braced wagons, (besides several two-horse teams, which are not reckoned in this calculation) engaged in hauling fruit, which is raised within a radius of six miles of this city,—over the mountains to Virginia City and vicinity. Those teams make a trip every nine days, or ten trips each in the last 90 days—a total of 384 loads averaging 4,000 lbs each or 1,520,000 pounds of apples, peaches, pears,

plums, grapes, figs &c., which I am told by one of the raisers and shippers average five and a half cents per pound, or about \$20 per load, and yielding a total of \$83,600.

Most of the farmers have their own teams and do their carrying, purchasing occasionally something of a neighbor, to make an assortment. This sum is for fruit shipped in one direction, from Placerville, Gold Hill and Cold, Diamond and Mud Springs. In addition to the above, L. D. Marks and B. F. Crocker have shipped of their own raising, or that purchased in this vicinity more than seventy-five tons of green fruit to Sacramento and San Francisco. Coloma, Uniontown, Kelsey and Georgetown have, during the same time, shipped three tons per day to Auburn, a portion to go over the mountains, the remainder to Sacramento and San Francisco, by the Central P. R. R., amounting to 540,000 pounds, which averaged two cents per pound at the orchard, or some \$10,800.

C. D. Brooks of Diamond Springs has raised and shipped some 16,000 pounds of fine cling-stone peaches, their equal not being produced at any other place in the State, as experiment has shown; for Mr. B. has been without a successful competitor for the last ten years, always finding a ready sale in your city,—the price being about the same, \$160 per ton. Efforts have failed at other localities in this county to produce a like peach, even from trees transplanted from Mr. B.'s nursery. J. W. Foster & Son, of this city, will work up some 200 tons of grapes, into wine and brandy, more than 20,000 gallons of the former and about 3,000 of the latter. The Fosters raise about 120 tons of grapes, the remainder being purchased. Robert Chalmers, of Coloma, will make about 25,000 gallons of wine and 1,000 gallons of brandy. Mr. C. has about 100,000 bearing vines. About 200 tons of grapes were contracted for, last week, in the townships of White Oak, Mud and Diamond Springs by parties in Sacramento, to be delivered at Shingle Springs, at \$19 per ton.

J. W. B. Dickson, near this city, will produce 75 or 80 tons of grapes, of which several tons are flame colored Tokay and Muscat of Alexandria. In addition to the above, I should mention the dried fruit, which amounts to many tons, and the winter apples and pears which may be reckoned at hundreds of tons, now in the bins, or on the trees of the fruit growers.

Your correspondent has less than four acres of "Mission" grapes, which commenced bearing in 1863 and each year since have produced a fair crop, averaging about 19 tons per annum. The first crop was sold for \$80 per ton in the vineyard, the last for \$20.

The cost per annum since the vines commenced bearing has been about as follows: Pruning in Jan. and Feb., \$60; plowing and cultivating, man and horse, 8 days, \$24; four days weeding and hoeing, \$8; 14 days picking, \$28; total \$ 24, producing at the lowest figure for which they have sold, \$380 profit, over expense of cultivating, \$256; or more than \$64 per acre. No irrigation is used, although the vineyard is situated on a dry hill or knoll.

Do wheat lands in the valley, continually cropped and running out, show a better profit than this? [Scarcely one quarter as much, EDS. PRESS.] The above are facts which cannot be gain said. With land at from \$1.25 to \$5.00 per acre, why has this county dwindled from a population, in 1853 of 43,000 to 10,300 in 1870? To a certain extent the question is easily answered; El Dorado being the locality where gold was first discovered and worked, a rush to the mines followed, the county filled up with a roving set of men, who on the first report of rich discoveries of gold at Gold Lake, Kern River, Cariboo, Fraser River, Washoe, Idaho or Montana, etc., were on the wing, for those far off lands. Such was the condition of things up to 1862. At that date families began to accumulate, and more or less attention was given to agriculture; vineyards, fruit trees and gardens, were planted in homes made pleasant and comfortable by the production of fruit, flowers and vegetables.

The placer mines were beginning to be worked out, the roving miners sought some new locality, while families remained and improved their possessions and have become identified with the interests of the State.

El Dorado has seen its darkest day, wonderful success in fruit has been attained as I have shown by the above figures, and prosperity will continue. Congress is expected to give a subsidy in lands, now of

but little or no value to the Government, to assist the owners of water rights, in constructing canals, and ditches for the transportation of lumber, irrigation, hydraulic power and mining. With a canal sufficient in size to float lumber, those lands would be of value; for the timber on them could be conveyed to market, and when cleared of timber, they could be used for grazing in the summer months, when the valley and plains below are parched and dry. This subsidy is needed and if Congress and the members of that body from this State know and do their duty to the people here, it will at once be attended to. Then new and permanent houses will be built, families locate, farms, orchards, vineyards and gardens multiply; for when it becomes known that a lasting supply of water can be had for fruit trees, gardens and young vines, thousands of emigrants will come and purchase our cheap lands and become permanent, prosperous and happy citizens. Placerville, Oct. 24th 1870. E. N. S.

Animals that Chew the Cud.

Ruminating animals gather their food rapidly, give it a few cuts with the teeth and swallow it. It goes to an interior receptacle, where it is moistened; this is very essential if it be dry hay. When the animal has filled himself, he masticates the food thus stowed away in his stomach, raising it cud by cud. When a portion is completely masticated, it passes to another receptacle, and the progress of digestion goes on. Thus an ox, if left to himself, will raise and masticate all his food thus stowed away in his stomach. If he be pushed and worked hard, and does not have time to masticate, he falls off in flesh, his health is poor, his digestion incomplete.

The horse, on the contrary, however much in a hurry he may be, must masticate each mouthful before he swallows it. A hungry ox, let into a meadow, will fill himself in twenty minutes, while a horse would want at least an hour and twenty minutes to take the same amount of grass. The ox, deer, sheep, goat, chamois and rabbit, being the natural prey of ferocious beasts, are endowed with the extra stomach in which hastily to stow away the food without mastication. This may, perhaps, be regarded as a wise provision of Nature, enabling them to sally forth where the food is plenty, and in a short time fill themselves and retire to a place of safety to ruminate their food at their leisure.

RAM-ROD HAY, is the expressive name applied to hay made from a coarse species of prairie grass which grows upon the Mississippi bottoms in Iowa. It is generally used for thatching purposes, possesses very little nutrition, and when fed to stock is apt to produce indigestion, especially with horses.

THE CITRON CROP, for the present year, is estimated by the department of agriculture at 3,203,800 bales, an increase of about 33 per cent. over the crop of 1868—69.

Household Reading

Interesting Facts.

When a hibernating animal commences his winter's sleep, he goes to his chosen quarters well provided with fat. The only activity kept up during his long sleep, is a very feeble breathing and a slow circulation of blood. This action makes such slight requisition upon his system, and his close quarters so economises the animal heat, that his accumulated fat furnishes all the fuel that is needed. But he comes forth in the spring, lean, hungry and weak.

The camel carries in the hump of fat upon his back, the necessary supply of fuel for a long march across the desert. A fat man will live much longer without food, than a lean one, and any person will live longer without food, in a warm atmosphere than in a cold one; for the animal heat in the absence of food, must be kept up by the consumption of the body—the fat being first appropriated and entirely, then the muscles will furnish heat for a short time longer.

Death from starvation or a lack of proper food generally ensues to a previously healthy subject after the system has been reduced about four-tenths of its weight—a person well provided with fat will sustain a somewhat greater reduction; while a lean subject will succumb to a reduction a little short of that percentage. Moreover an insufficiency of food is just as certain to produce death, if kept up a sufficient length of time, as total abstinence therefrom. And what is quite curious, death comes at the same point of reduction—four-tenths. Thus when a person in a moderate condition of flesh is reduced from 100 pounds weight to 60, death may be expected at any time; if he weighed 150 at the start, 90 lbs. will be about the lowest point of reduction which he can survive.

Our Industrial Population.

It is estimated that of the 40,000,000 population in the United States, 11,000,000 add directly by their labor to the wealth of the country—of which number not less than 6,500,000 are agriculturists. The balance of the number is made up as follows:—Commercial classes 2,000,000; common laborers 1,500,000; mechanics 1,000,000. The large excess of the agricultural element in the above estimate, is both an interesting and notable fact.

WHY IT IS HOTTER INSIDE THAN OUTSIDE OF A HOT-HOUSE.—This is explained on the principle that there are two kinds of heat—luminous and non-luminous. The former will pass through glass, as readily as through air; while the latter is arrested by it, or can only pass by conduction—that is, by working its way out, so to speak, from particle to particle of the glass. If we hold a thermometer near a red-hot cannon ball, with a plate of glass intervening, the mercury will rise as rapidly as though the glass was absent; but if we hold it before a ball heated to less than redness and note the rise of the thermometer, and then interpose a plate of glass, the mercury will fall almost as rapidly as it rose, until it reaches very nearly or quite its original mark.

So the glass roof of the hot-house, allows the luminous heat of the sun to pass through it freely; which heat, once inside, becomes reflected or non-luminous, and as such, is arrested by the glass, so that it cannot escape except as above, by conduction. The sun's luminous rays are thus entrapped as it were, and accumulated, until the heat within the hot-house is much greater than that outside.

HOUSEHOLD WEIGHTS AND MEASURES.—Wheat flour weighs one pound to a quart. Indian meal, one pound two ounces to a quart. Butter, when soft, one pound to a quart. Loaf sugar, broken, one pound to a quart. Wheat sugar, powdered, one pound one ounce to a quart. Eggs, average size, ten to a pound.

Checking Perspiration.

The danger of risking the stoppage of the pores by sudden change of temperature is terribly illustrated every day. A case is related of a leading New York gentleman who having exerted himself on a vessel somewhat unusually, found himself, at the end of an hour and a half, pretty well exhausted, and perspiring freely. He sat down to rest. The cool wind from the sea was delightful, and, engaging in conversation, time passed faster than he was aware of. In attempting to rise, he found he was unable to do so without assistance. He was taken home and put to bed, where he remained for two years; and for a long time afterward could only hobble about with the aid of a crutch.

Less exposures than this have, in constitutions not so vigorous, resulted in inflammation of the lungs, "pneumonia," ending in death in less than a week, or causing tedious rheumatism, to be a source of torture for a life time.

Multitudes of lives would be saved every year, and an incalculable amount of human suffering would be prevented, if parents would begin to explain to their children, at the age of three or four years, the danger which attends cooling off too quickly after exercise, and the importance of not standing still after exercise, or work, or play, or of remaining exposed to a wind, or of sitting at an open window or door, or of pulling off any garment, even the hat or bonnet, while in a heat. It should be remembered by all that a cold never comes without a cause, and that, in four times out of five, it is the result of leaving off exercise too suddenly, or of remaining still in the wind, or in a cooler atmosphere than that in which the exercise has been taken.

ARTIFICIAL BUTTER.—Has the chemist's skill attained to such results as enable him to manufacture the delicious and important food substance known to us as butter? This is an interesting question. Through recent foreign advices we learn that M. Méyé, a Parisian chemist, is actually making good palatable butter out of a variety of animal fats, by a process which is patented in nearly all the countries of Europe. His claim is that by subjecting sweet lard or other animal fat to great pressure, by which the stearine is extracted, an oily material is obtained, the composition of which is identical with butter. After obtaining this "oily material," he subjects it to a variety of chemical processes, which result in securing the flavor and physical characteristics of prime butter. The patent specifications and claims are presented with much detail; and the reader who is interested in butter nearness is carried along through all the steps by which unsophisticated grease becomes sophisticated fat, and ultimately butter, of a character which would pass unchallenged through the hands of a first-class butter inspector. This is certainly very important scientific intelligence, if true; but we are not yet ready to break up or burn up our churns, and send our cows to the butcher. We prefer to wait for further advices. Butter is a delicate animal compound, which, in our view, cannot be fabricated or imitated successfully by any chemical process whatever. Doubtless a substance can be produced which may serve as a fair substitute for butter among certain classes in Europe; but the fastidious taste of large consumers, both in that country and this, can never be satisfied with butter coming from any other sources than the sweet grasses of the hills and meadows, or from the cereal grains, transmuted or changed by the subtle chemistry of the animal organism.—*Jour. Chemistry.*

DOMESTIC ECONOMY is a science—a theory of life which all sensible women ought to study and practice. No young lady is fit to be married until she has been thoroughly educated in the deep and profound mysteries of the kitchen. See to it, all ye who are mothers, that your daughters are accomplished by an experimental knowledge of good housekeeping.

WHEN WE SHOULD NOT TAKE MEDICINE.—If a man can sleep soundly, and has a good appetite, with no unpleasant reminders after meals, the bodily habits being regular every day, he had better let medicine alone, whether he is as high as a hog-head, or as thin and as dry as a fence-rail. Such is the sensible advice of the *Herald of Health*.

RAIN WATER is not so well adapted for cooking purposes as well or spring-water. Rain-water is very nearly pure, and pure water is not adapted to the animal system.

Household Receipts.

ICEB GRAPES.—A nice dessert may be made of grapes in the following manner:—Take small bunches of choice, small grapes, beat the whites of two eggs, and mix them with a quarter of a pint of spring water. Dip each bunch of grapes into the egg and water, drain them two minutes, roll them two or three times in powdered loaf sugar, and lay them on sheets of white paper to dry, when the sugar will become crystallized. Plums, cherries, currants or strawberries, may be iced in the same manner.

CANNING EGGS.—Somebody gives the following:—All know how to can peaches and other fruits, but few are familiar with canning eggs. Place the eggs in the jar, with the large end down; place the jar in boiling water, where let it remain until the inner atmosphere of the jar is about blood heat, when seal and remove into cold water. [We should suppose that if the spaces between the eggs were filled by some dry, undecomposable substance, like dry sand, the process would be more perfect, as the secret consists simply in the partial exhaustion of the air by the heat.—*Ens. Press.*]

HOW TO CLEAN OIL-CLOTHS.—To RUIN them, clean them with hot water or soap-suds and leave them half wiped, and they will look very bright while wet, but very dingy and dirty when dry, and will soon crack and peel off. But if you wish to PRESERVE them, and have them look new and nice, wash them with soft flannel and lukewarm water and wipe perfectly dry. If you want them to look extra nice after they are wiped, drop a few spoonfuls of milk over them, and rub them with a dry cloth.

A DELIGHTFUL DISH FOR BREAKFAST may be prepared as follows:—Remove the cream from some milk just before it turns, then take milk just "lobbered," set it on the stove, warm it just enough to separate the curd and whey, drain off the whey and pour over the curd the thick rich sweet cream. This dish is known as "cream cheese."

FRIED SQUASH.—A delicious dish can be made simply by frying them in butter. Slice them as you would cucumbers, dip in dry flour, fry to a brown and imagine that you are eating fried oysters. Cucumbers cooked in the same way are not bad.

MOTHS may be kept out of furs and woolen clothes by wrapping the fabric in calico. Moths cannot eat through calico.

Mechanical Items.

TO JUDGE THE QUALITY OF IRON OR STEEL. Microscopic examinations of iron and steel show that the more regular and small the crystals are, the better the metal. Moreover, in good metals, the crystals are placed very regular as well as close.

TO DISSOLVE WOOL OR BONES.—Wool can be reduced into a paste resembling glue by submitting it for several hours in a close vessel, to the action of high pressure steam. Bones can also be dissolved in the same manner. Water of an elevated temperature is one of the most powerful solvents.

TO DISSOLVE COPAL, as commonly done, by means of alcohol is a very tedious process; but if a little camphor is previously dissolved in the alcohol, the solution may be effected in half the time.

TO PREPARE FENCE POSTS.—Soak the post that enters the ground 24 hours in a solution of silicate of soda (soluble quartz); then let them dry and in a week soak again, and when dry cover with some cheap mineral paint, and the post will last three times as long as though it had been charred. The silicate of soda can be obtained of any druggist, and is cheap. To prepare it, dissolve the silicate in the least quantity of water which will accomplish the same, and when so dissolved, add three times its bulk of rain or clean river water.

BAMBOO AS A SUBSTITUTE FOR WOOL.—Several Newark, (N. J.) capitalists are about to commence the manufacture of a substitute for coarse woolen goods from prepared bamboo cane.

TO BRONZE GUN BARRELS.—Dilute nitric acid with water, and rub the gun barrels with it; lay them by for a few days, and rub them with oil, and polish them with bees-wax.

A PIECE of calico a mile long has been manufactured in New England.

A SPECTACLE manufactory at New Haven Conn., is said to be the most extensive in the world. The company manufactures annually 300,000.

Life Thoughts.

HOW TO RESIST AN INJURY.—If any one wrongs you he bravely revenged by slighting the injury. He is below himself who is not above an injury.

DON'T INTERFERE another while he is speaking; hear him out and you will better understand him, and be the better able to reply.

HOPE is like the cord in a net; it keeps the soul from sinking in despair.

FEAR is like the lead attached to a net which keeps it from floating in presumption.

OPPORTUNITY is the flower of time; as we pluck the flower from the stock, so should we seize the opportunity presented by the passing moment.

GOOD COMPANY and good conversation are the sinews and life of a happy and virtuous existence.

OUR ACTIONS are like the termination of verses—to be rhymed as we please.

KINDNESS should be stowed away in the heart like bags of lavender in a drawer, and employed to sweeten every object around them.

HOW TO TREAT ANNOYANCES.—Take hold of them stoutly, as you would of a nettle to avoid being stung.

THINK BEFORE YOU ACT.—Pretty much of all the absurd schemes in the world result from a failure to observe this simple rule.

SMALL EVILS are like small debts—worse than great ones. It is much easier to endure misfortune than to bear an inconvenience.

TRUE MODESTY.—Nothing is more amiable than true modesty, and nothing more contemptible than that which is false; the one guards virtue the other betrays it.

AVOID IDLENESS.—The ruin of most men dates from some idle hour. Occupation is an armor to the soul.

A NOBLE SENTIMENT.—When Gen. Lee saw the hopelessness of his cause, and was reduced to the necessity of surrender, he remarked that "honor and virtue should be equal to human calamity."—A sentiment superior to all misfortune.

The mind ought sometimes to be diverted, that it may return the better to thinking.

SIMPLICITY and modesty are among the most engaging qualities of every superior mind.

Benefits of Laughter.

Probably there is not the remotest corner or little inlet of the minute blood vessels of the body that does not feel some wavelet from the great convulsion produced by hearty laughter shaking the central man. The blood moves more lively—probably its chemical, electric, or vital condition is distinctly modified—it conveys a different impression to all the organs of the body, as it visits them on that particular mystic journey, when the man is laughing, from what it does at other times. And thus it is that a good laugh lengthens a man's life by conveying a distinct and additional stimulus to the vital forces. The time may come when physicians, attending more closely than they do now, to the innumerable subtle influences which the soul exerts upon its tenement of clay, shall prescribe to a torpid patient "so many peals of laughter, to be undergone at such and such a time," just as they now do that far more objectionable prescription—a pill, or an electric or galvanic shock; and shall study the best and most effective method of producing the required effect in each patient.

EVEN A SMILE.—Who can tell its value? It costs the giver nothing, while it is beyond price to the erring and relenting, the sad and cheerless, the lost and forsaken. It disarms malice—subdues temper—turns hatred to love—revenge to kindness—and paves the darkest paths with gems of sunlight. A smile on the brow betrays a kind heart, a pleasant friend, an affectionate brother, a dutiful son, a happy husband. It adds a charm to beauty, it decorates the face of the deformed, and makes a lovely woman resemble an angel in Paradise.

MAKE YOUR OPPORTUNITIES.—It was a saying of the first Napoleon that every man should make opportunities—his chance. —But as a general thing, while ten men watch for chances, only one makes chances; while ten men wait for something to turn up, only one turns something up; so while ten men fail, one succeeds, and is called a man of luck, and the favorite of fortune. There is no luck like luck, and fortune most favors those who are most indifferent to fortune.

Scientific Press.

B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY. GEO. H. STRONG.
W. B. EWER. JNO. L. BOONE.

Office, No. 414 Clay St., below Sansome.

Two Editions.—We now issue a mining edition and a farming edition of the Press. The difference consists in changing the reading matter of the 6th and 7th pages [all advertisements appear in both issues, affording an immense circulation.] Subscribers will please notify us if they do not receive the edition they prefer. Both editions furnished to one address for \$7 per annum.

Gold and Legal Tender Rates.

San Francisco, Thursday, Nov. 17, 1870.—Legal Tenders buying @89; selling @90. Gold in New York to-day 112½.

An Excellent Work.

We have recently received from R. Brough Smyth, F. G. S., Secretary for mines for the Colony of Victoria, a copy of his excellent work on the "Gold Fields and Mineral Districts of Victoria," a book to which we have often alluded. We find in this work a very great amount of most valuable matter,—much that, besides its worth as a description of a particular country, give extensive food for thought for miners, geologists and mineralogists elsewhere. We regard it as a most useful contribution to the scanty library of mining existing in the English language, and as an example to be followed elsewhere. Had we similar works in all the mineral districts of the world, mining and its kindred sciences would be much further advanced than they are now.

We know of the existence of but two other copies of the book on our coast, and these we have been permitted to use from time to time. Although we have spoken strongly at divers previous times in its praise, no bookstore in this city has a copy for sale. We believe that it could be readily sold here at a price which would allow a fair profit to the importer; we have ourselves been applied to by a number of persons who desired it.

We shall hereafter make extracts from the book as we have done to some extent previously. We had prepared an article on the formation of gold nuggets for this issue, but are obliged to defer it until another time.

ANOTHER ELEVATED CITY RAILWAY.—The Chicago Railroad Gazette describes a new plan. Wrought iron gothic arches, at intervals, span the street from curbstone to curbstone. Under these, at a sufficient height above the street to clear the travel, are elliptical iron arches, upon which rest the tracks, supported by an iron truss from the apex of each of the gothic arches, and a similar one at each side. A light locomotive is proposed.

Mechanic Arts College.

The hall of the Mechanics' Institute was crowded last Saturday night, many being unable to obtain seats. A large number of persons (some 360, of whom about 100 are ladies) had enrolled their names as students, and since then many more have joined. It is most gratifying to find such a number evincing a disposition to profit by the opportunity offered them.

Rules.

Mr. Hallidie read the following rules for the government of those attending the lectures:

1. Students must enroll themselves in a register kept for that purpose.
2. Presence at roll-call is essential. Roll-call will be at 7:30 p. m.
3. Absence from three consecutive lectures, or ten lectures in all, will entail erasure of name from register.
4. Students must receive a ticket, which they will show on entering the lecture room.
5. Students entering after their names have been called, or before the completion of roll-call, must report themselves by announcing their names.

Visitors will be admitted to each lecture and will be furnished with an unoccupied seat on application to the Librarian of the Mechanics' Institute.

No visitor must occupy a student's seat.

Any person who desires can enroll his name; and, apparently, those who are not enrolled as students will stand but a poor chance of getting a good seat, the students having the front rows. [Since the above was written, we learn that 500 students are enrolled, filling the list. In this connection, we may note that 32 members joined the Mechanics' Institute between the 1st and the 15th of this month, and that more books were taken from the library on Saturday last than on any one day before, as far as can be learned. These facts show one effect of these lectures on the community.]

Opening Address.

The opening address was delivered by Judge J. W. Dwinelle. The speaker commented on the meaning of the word *University*, and explained the universal scope included in the plan of our State institution. Technical education, that is, education in the sciences applied to professional and industrial pursuits, had not received its proper position in our colleges and universities generally. He referred to the great influence of the London University, which gave the death blow to old superstitions and placed technical education on its true basis. The Judge's enthusiasm, however, led him to make one or two statements here which were a little too strong.

The speaker paid a tribute to the Regents for their efforts, and claimed that the University could not fail to succeed—had succeeded already. He then traced four periods in the history of the mechanic classes. A few hundred years ago there was not a mechanic in England who was not a slave, a part of the soil on which he was born, attached to it and passing with it to its purchaser. This was the period of *slavery*. Then came that of *emancipation*, slowly and silently. The personal service of the serf was turned into rent, and when there was competition in rents the lord of the land accepted the highest bidder, whether horn on the soil or not; and so the period of emancipation was reached. But the mechanic classes were despised and degraded at first. The period of *progress*, however, produced Watt, the perfecter of the steam engine; Arkwright, inventor of the spinning jenny; Stephenson, and a host of others, who gradually caused the proper recognition and betterment of the operative classes. Finally, we have now reached the period of *education*, and on the importance of education the Judge spoke at length. He would not have any one feel that, because he had not had opportunities before, he could not have them hereafter. There was no one present, he said, below the middle age of life, who cannot make him-

self a well educated man, while every step of progress would be one of pleasure. We need not go back to Cato, who learned Greek at 80; we will only point at Stephenson, who learned to read and write after 18; to Arkwright, who learned his grammar after he was 50; to Sanderson, the blind professor of Latin; to Hugh Miller, the stone cutter and geologist. Sir Isaac Newton was a slow, dull man who believed not in genius but in patience and perseverance. Sir Joshua Reynolds, the painter, insisted that success came not of genius, but of labor and economy of time.

The Judge dwelt on the great possibilities of sturdy work and study, and exhorted his audience to care for the minutes, husband them, and put them out at interest. After eloquently speaking on this topic he closed his address, remarking that on this evening a new era was inaugurated here, when the mechanic will be recognized as an educated gentleman, when men will graduate from the University to the forge and workshop, and when generations of Peabodys, Coopers and Stewarts shall prove that California is justified in her children.

Prof. Le Conte then delivered the introductory lecture of the course, on geology and particularly the coal measures. The lecturer was listened to throughout with marked attention, and his remarks were excellent and often eloquent. A report will be found on the twelfth page.

NARROW GAUGE RAILWAYS.—The Duke of Sutherland has returned from his inspection of the Norwegian narrow gauge roads. Upwards of a hundred miles of railway on the 3 feet 6 inches gauge have been carried out in Norway and have been most successful for the light traffic of that country in their economical construction and the convenience of their smaller carriages and wagons. The supporters of this system have no doubt that if the North of Scotland could have had the advantage of such a cheap description of railways, a much greater extent of the country would ere now have been supplied with railway accommodation. The average cost per mile, including plant, is about £4,000, and the works, etc., are said to be all that could be desired for public convenience.—*Inverness Courier*.

WOODEN RAILWAYS.—A railway costing only \$6,000 per mile, including right of way, grading, track and rolling stock complete, is certainly a novelty. That is the cost, according to the *Canadian Monetary Times*, of the Quebec and Gosford Wooden Railway, if the statement of the President is to be accepted. The road is 25 miles long, gauge 4 feet 8½ inches, being the width of most of the American and English railways, speed from twenty to thirty miles an hour, length of rail 14 feet, depth 7 inches, thickness 4 inches. Each rail rests on seven sleepers, to which it is fastened by wedges, so that it can easily be taken up at any time. The locomotive now used on the Quebec and Gosford Railway weighs 21 tons, loaded, without the tender. This road will be completed in October and ready for traffic. It is very satisfactory to know that there is an immediate prospect that wooden railways will be practically tested in Canada; should they prove to be so well adapted, as it is believed they are, to accommodate new districts where the traffic is limited, they will come into large demand to act as feeders to the iron roads.—*U. S. Min. & R. R. Register*.

PICTURESQUE AMERICA.—Appleton's *Journal* commences a series of profusely (and excellently well) illustrated articles with this heading. The proprietors sent an artist, some time ago, on a tour through different parts of our country, to furnish drawings and descriptive illustrations of the scenery and customs of various localities, from Florida to Canada, and we are now enjoying the results of this most praiseworthy action.

Good.—The Massachusetts Grand Lodge of Knights of St. Crispin have adopted two most excellent and intelligent decisions: to put an end to strikes in their association, and to change this into a co-operative organization.

Narrow Gauge R. R. Co.

The following incorporation is of special interest for the Coast and may result in important effects if the matter is properly managed. It is that of the Narrow Gauge R. R. Co., which was filed in the County Clerk's office on the 14th inst. The objects of the corporation will be, to take contracts to construct, equip and operate narrow gauge railways throughout the United States and countries adjacent thereto, and to receive pay therefor in cash, stocks, bonds, lands and properties, or securities of any kind as to this corporation may seem best; Also to own, hold or sell the same, as may be deemed advisable by the Company; As such contractors, to build narrow-gauge railroads in such territories, and equip, operate, and by purchase, to own and operate the same, as the interests of the Company may justify; To generally transact any business in connection with the object sought to be obtained by the creation of this corporation.

The Trustees of the Company are L. L. Robinson, S. F. Butterworth, C. J. Brenham, Isaac Friedlander, Irvin M. Scott, John Foster, F. MacCrellish, F. A. Hihn and Phineas Banning. The capital stock is one million of dollars, divided into ten thousand shares of one hundred dollars each.

We have had the pleasure of a call from Mr. Banning this week, and a conversation with him on the subject of cheap railways. Mr. Banning is enthusiastic in the matter and fully alive to the importance of the system for our Coast. He is fully identified with the interests of the lower part of this state where he has lived for many years, and where he hopes to live many more, and feels that cheap and efficient transportation will further in the highest degree the development of the country's resources. He affirms that roads can be built on the narrow gauge system at the rate of \$10,000 per mile. He has very industriously collected a large amount of important information concerning the construction and successful operation of narrow gauge roads in Europe and our own country.

The Press has strongly urged this matter on our western public at various times, for several years. And over ten years ago one of the editors of this paper, then connected with the old *California Mining Journal* published at Grass Valley, called attention to the subject of narrow gauge and its application to this coast.

State Gold Medals.

The committee of the State Agricultural Society have awarded gold medals for the most meritorious exhibition in the several departments of the late Fair, as follows:

FIRST DEPARTMENT.—For stock. Not yet given.

SECOND DEPARTMENT.—To Wm. Sawden, of Grass Valley, for sewing machine of California invention. A special medal is recommended to Pollard & Corville, for carriages.

THIRD DEPARTMENT.—To Frank Foster, of Sacramento, for book-binding. Special medal recommended to J. S. Finch, of Alameda, for ramie.

FOURTH DEPARTMENT.—To Nichols, Folioy & Co. of Sacramento, for woodenware, etc. Special medal recommended to John Brenner, of Sacramento, for furniture.

FIFTH DEPARTMENT.—To B. N. Bughy, of Folsom, for wines. Special medal recommended to the Sacramento Valley Beet Sugar Co., for beet sugar.

SIXTH DEPARTMENT.—To J. R. Nickerson, of Lincoln, Placer county, for fruit.

SEVENTH DEPARTMENT.—To Jacob Zech, of San Francisco, for pianos. Special medal recommended to S. W. Shaw, of San Francisco, for oil painting.

SUNK.—A New York telegram of the 13th says: Three acres of land near Basket Station of the North Delaware Division of the Erie Railroad, sunk a few days ago to the depth of 4 feet. No water has appeared.

Ericsson's System of Submarine Attack.

Considerable attention has been drawn to this method by a letter from Captain Ericsson, together with a diagram (here given) originally published in *Engineering*, and reproduced in the *Am. Artisan* from which we take it. On account of space we are compelled to extract from Capt. Ericsson's communication only those parts more directly relating to the details of his system, leaving out much relating to the general theoretical considerations which, though important, would not interest a large class of our readers. Those wishing to study out the whole subject, are referred to the above named papers. The following is from the Captain's letter.

The accompanying sketch presents the main features of my new system of submarine attack so distinctly, that it will be superfluous to enter on a general explanation of the nature of the scheme. It may be well to state that the elongated shell is charged with dynamite, and provided with a percussion lock and trigger, to be actuated as described in my former communication relative to the self-acting torpedo.

It is well known that numerous plans have been suggested, during the last few years, for firing under water, for the purpose of piercing the hull of iron-clad vessels below the point protected by the armor. In several instances these plans have been carried into practice, with the inevitable result that the resistance of the water has been found so great, even at very short distances, that an ordinary wooden hull has proved to be impenetrable. The plan now under consideration bears no resemblance to these projects. In the first place, the attack is made at a distance; and secondly, the force of the missile on reaching its destination need only be sufficient to actuate the trigger which causes the ignition of the explosive charge.

Apart from the theoretical considerations relating to the course of the elongated shell under water, the practical question of motive power to propel the shell presents itself at the first step in the investigation. It is hardly necessary to state that the force relied upon is the *vis viva* possessed by the shell on coming in contact with the water. The *vis viva* of a shell 15 inches in diameter, of such a length that it displaces 500 lbs. of water, may be readily estimated if we suppose the charge of powder in the gun to be so regulated that the shell will enter the water at the required rate of 400 feet per second; thus, $400 \cdot 64 = 2,344 \times 500 = 1,172,000$ foot-pounds. A cylindrical body 15 inches in diameter, with hemi-spherical ends, moving at a rate of 50 feet per second under water, requires a constant motive force of somewhat less than 400 lbs. Assuming, then, that the shell passes through 120 feet of water—the mean distance represented by the accompanying diagram—we have a resistance of $120 \times 400 = 48,000$ foot-pounds to overcome. The motive force, it will thus be seen, is more than four times greater than the resistance; hence no doubt can be raised as to the adequacy of the motive power furnished by the *vis viva* of the shell. It should be observed that the speed of the shell diminishes in a very rapid ratio; but it would be futile to present a formula expressing the ratio of speed and resistance, since the form of the body is the chief element in the calculation. Suffice it to say that, while the resistance against a blunt body is so great that it can hardly be overcome, one provided with a sharp point enters the water with much facility, even at the rate of 400 feet per second. The passage of the shell through the water will, therefore, be sufficiently rapid to reach the desired object in proper time.

With reference to the gun, it should be borne in mind that the very low speed of the shell, and the consequent small charge of powder needed, render heavy metal unnecessary. Besides, slow burning cake-powder contained in cellular cartridges will be employed for the purpose of checking rapid ignition, and in order to sustain a uniform pressure during the discharge. By reference to our sketch it will be seen that the guns are loaded from below, and for

that purpose so arranged as to admit of being suspended by adjustable pendulum links secured under the turret-roof. The recoil is checked by buffers attached to the turret wall in the rear of the breach.

Respecting the safety of the charge in the shell from ignition during the discharge, it will be well to observe that efficient means have been devised to prevent such an accident. With reference to the caliber, it is evident that this system of attack calls for dimensions that will admit a shell of sufficient capacity to contain a charge which, by its explosion, will destroy a first class ship of war built on the cellular plan. Nothing short of 300 lbs. of dynamite will suffice for this purpose; hence nothing less than 15 inches caliber will answer. The American and Swedish 15-inch guns are admirably calculated for the purpose, although they are unnecessarily heavy.

The important question of hitting the intended object will be best answered by a careful examination of the accompanying diagram, which cannot fail to convince naval men that, in moderate weather, the elongated shell may be made to dip at the proper distance from an opponent's vessel. The diagram clearly shows that no great accuracy is called for, and that the shell may dip at various distances from the vessel assailed and yet strike the hull. It should be observed that the vertical scale of the diagram is different from that of the horizontal, in order not to place the vessels too far apart for the limited size of this page, consequently the trajectory shown is distorted.

ERICSSON'S NEW SYSTEM OF SUBMARINE ATTACK.

The turret, it may be briefly noticed, in which the light 15-inch-shell guns are mounted, is composed of flat wrought-iron plates forming a square box, wide enough to accommodate the two pieces, suspended, as already stated, by pendulum links secured under the turret-roof. A massive central shaft of wrought-iron supports the square box, on the plan adopted in the monitor turrets. The vessel designed to carry the rotating square box with its light shell-guns is a mere iron hull crammed with motive power, in order to insure a higher speed than that of existing iron-clad ships of war. The midship section is triangular, and the bow raking as indicated by our sketch. The overhanging sides and deck are heavily armored.

PROGRESS IN ARIZONA.—A letter from Arizona, in the *San Bernardino Guardian*, says: A few years ago there were about five farms on the road [from the Colorado] to Prescott. Now there are fifty. Horses have taken the places of huts, and comfort and plenty have supplanted discomfort and privation. Two years ago the settlement of Salt River was begun. To-day it is occupied for thirty miles in length, and producing marvellously. The men who went there poor at that time are prosperous and rich farmers now. Very rich mines are being worked and others are waiting for water. The population is more than double and the productions more than quadrupled.

WORTHY OF IMITATION.—The authorities of the county of Westmeath, Ireland, (we learn from the *R. R. Gazette*) advertised in the London technical papers for a county surveyor. The advertisement announces that an open competition will be held, and the applicants examined in branches of knowledge mentioned. Such a plan is most excellent, and would, if extended to other offices, ensure a most efficient civil service. Shall we never adopt any such measures in our enlightened country?

YUBA COUNTY.—The real estate and personal property are valued at \$3,975,395, and beside these the county property is valued at \$65,000. The rate of taxation for the county is \$1.68%.

FOR THE FOSSIL SHIP.—Charley Cluker and party started again on this morning (says the *San Bernardino Guardian* of November 5th) to find the mythical ship upon the desert this side of Los Palmas. Charley made the trip three or four weeks ago, but made the wrong "chute," and wired his wagon upon the desert when, according to his calculations, he was within ten or fifteen miles of his destination. He is satisfied from the information that he has received from the Indians, that the ship is no myth, and is determined to probe the matter to the bottom, being well prepared with a good wagon, pack-saddles, planks to cross any mucky ground, etc.; and Charley being an enthusiast in the cause of science, if the ship is there, the world will know it upon his return. We hope it is one of the old Spanish galleons, for his sake.

ENGINEERING DIFFICULTIES.—Natural phenomena, says *Nature*, must be regarded by the engineer in the tropics. Here the boring worm will teach him salutary caution. In the East we have seen a railway train stopped on an incline by locusts. The locusts have a fancy for sitting on the rails, and when the engine wheel touches them they are crushed, leaving the rail so oily that the wheel slips. On one line, in the locust season, sand-boxes are used on the locomotives. Oysters are, however, a newly regarded enemy to the engineer. Some gourmand suggested the harbor of Tuticorin as a suitable place for oyster beds, and the Madras Government, doubtless appreciative of the value of oye-

THE AREY FURNACE.—A gentleman writes us from Georgetown that one of the Arey furnaces is being erected there at present and is expected to be in operation on or about the first of April, 1871. "When in operation and its practical results proven, I will give you the chemical process of the furnace. I see there is a wrong impression out your way in regard to its construction and chemical results and means employed, as well also as the principles upon which it is based, it being a combination of two principles, which combination is not used by any furnace known at the present time except the Arey furnace. But I do not wish to expiate upon the merits of the furnace until I can speak from actual facts."

THE SUBSIDY paid by the Imperial Government and the Australian colonies for the steamship service is £130,000, of which Victoria pays £12,145.10, being about one-half the amount paid by the seven colonies, more than double the amount paid by the older colony of New South Wales, and £5,000 more than is paid by the Imperial Government.

GLUE MANUFACTURE.—Few persons are probably aware of what vast quantities of glue are manufactured and consumed in the United States in the course of a year, and to what great variety of uses it is put. There are some forty or fifty manufacturing of this article in this country, which turn out annually, on an average, over 7,000,000 pounds of all grades and colors, from cheap sizing to the finest bonnet glue. It is used largely in cabinet work of all kinds, piano work, woolen and paper manufactures, oil cloths, etc.—almost every thing that is made requires more or less of this useful

article. The great bulk of glue used in this country is made at home, and we are not dependent upon foreign countries for a supply of the ingredients, though considerable quantities are imported every year. This article is made from the waste of hides and skins used by tanners and consists of the scraps and scavings. Prices range from 10c@25c. per lb. for ordinary qualities, and 40c@45c. per lb. for higher grades of white glues, which is somewhat lower than the ruling prices a year ago.—*Boston Com. Bulletin*.

GENERAL LAND OFFICE.—It has been stated that Commissioner Wilson is to resign. The statement is also contradicted.

We hope it is untrue. Mr. Wilson has held the office so long that he is posted in all the details; has proved himself most obliging and well qualified; and his resignation and removal at the present time would cause much trouble and be a serious misfortune. We find, by the way, the following in a Chicago telegram: Mr. Wilson has just completed his annual report which is a most voluminous and expensive review of the land system of the United States, and among other interesting views contains a chapter on the benefits of the emigration from Europe, and the amount of wealth added to the nation thereby. He has also devoted a very lengthy chapter to California, and dilates considerably upon the system of naturalization in this country in its hearings upon questions growing out of our land policy.

A CALIFORNIA HORTICULTURAL MAGAZINE.—We have received the initial number of *The California Horticulturist and Floral Magazine*, published by F. A. Miller & Co., of this city. It is to be issued, we presume, under the auspices of the "Bay District Horticultural Society." The number before us contains 32 pages of excellent matter well prepared and selected. The appearance of this publication gives evidence that a better interest is beginning to be felt in this important and interesting branch of industry. We hail it as an efficient co-worker in our efforts to spread useful information before the people. Published monthly at \$4 per annum.

MINING is becoming again attractive in this State. Business men who have capital have discovered, or at least are on the eve of discovering, that city real estate, situated in a city which has not well developed country surroundings, does not furnish the only reasonable investment for capital. It is beginning to be seen that our gold mines carefully and skillfully worked, will pay for all the trouble and money which may be expended upon them, nay more—that they will pay more surely and certainly than even wheat crops, in the long run of many years. The effect of this idea is that the mining counties are surely reviving, and that in property which is productive they are gradually, though not, rapidly increasing.—*Grass Valley Union*.

FIRE CLAY.—A gentleman is reported to have found in the vicinity of the Santa Cruz Mountains an extensive ledge of excellent fire clay.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Traveling Agents.

S. H. HERRING—California.
E. M. DEWEY, California.
L. MINER—Nevada, and Colorado.
A. C. KNOX, City Soliciting and Collecting Agent.

SUBSCRIPTION RATES.

Cash in Advance.—One year, \$4; six months, \$2.50; single copies, 10 cents; Monthly Series, \$4.50 per annum; Quarterly Series (stiff paper binding) \$5. [On Quarterly series, and papers sent to Foreign countries an additional sum must be added for advance postage.]

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock. 15v213m

GEO. E. PHELAN.

W. H. J. BROOKS,

Searcher of Records, and Examiner of

Titles,

IN ALL THE COUNTIES OF CALIFORNIA.

Abstract of Titles, examined and reported on.

HAVING DEVOTED HIS ATTENTION TO THIS BUSINESS EXCLUSIVELY during the past twelve years, he is familiar with the land and Conveyancing Laws of California, the Spanish, Mexican and American Records, and the Titles to Real Estate in San Francisco and all the Counties of California.

Persons contemplating the purchase of Real Estate in any portion of California can have the Titles thereto examined and reported on with accuracy and dispatch on reasonable terms.

PATENTS

Bought and Sold ON COMMISSION.

The Latest and Most Valuable Inventions can always be found at the office of

WIESTER & CO.,

Patent Brokers, 17 New Montgomery Street, San Francisco.

MILLER & HALEY'S MILLS,

BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above location, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers. 19v21-3m

MILLER & HALEY,

FOR SALE.—An account due this office for advertising for A. Jackson, of La Crosse, Wis., will discount 99 per cent. if necessary. 18v21.1y.

WIESTER & CO.,

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

NEW HOSE COUPLING.

This coupling is one of the most useful and perfect inventions of the day. It can be joined almost instantaneously and answers equally well for gas or water hose. Call and examine samples. The right, to any town or city on the coast, will be sold at a reasonable price.

Denn's Combination Gridiron.

No one who has studied the laws of Health will fail to appreciate this valuable culinary implement. It is well adapted for cake baking and other purposes, as well as for broiling meats. Foundry-men will find it to their advantage to examine it. The right to manufacture and sell is for sale cheap. Send for circular, or call and see sample Gridiron.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia Invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hold Your Horses!

By the use of "Burns Patent Safety Bridle" the wildest horse can be controlled with ease. The mildest bit is used and the horse's mouth cannot be injured.

No restive horse should be driven with any other bridle. Send for descriptive circulars, or call and see the Bridle. Shop Rights for Sale.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East.

We invite manufacturers and others, to call at our office and make their own investigations.

WIESTER & CO.,

17 New Montgomery Street, (Grand Hotel), San Francisco.

JUST THE WORK NEEDED.

Published July 20th, 1870.

ROASTING OF GOLD AND SILVER ORES,

EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

By G. KUSTEL, Engineer and Metallurgist; author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of All Kinds of Ores." 145 pages, 12mo. Illustrated by Numerous Engravings.

Published and sold by DEWEY & CO., SCIENTIFIC PRESS OFFICE, 414 Clay street, San Francisco. Price, \$2.50 coin, or \$3 currency. Postage, free.

AGENTS WANTED

FOR

Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever published. It is not only a

COMPLETE ENCYCLOPEDIA.

Freshly written, and up with the times, but is also a thorough and complete

Lexicon, a Gazetteer of the World, a History, a Geography, a Legal and Medical Dictionary,

And the only book ever published containing all these subjects, with 2,000 Engravings. This really wonderful work is to render readily accessible reliable information on every conceivable subject. No human being could be found to whom it would not prove invaluable. It minutely describes every disease; flesh is heir to; explains every legal term or phrase; gives the geography of the entire world; acquaints you with all noted men and women living or dead; describes every country, city and town; defines every word in use in the English language; pictures the birth-place and gives portraits of many distinguished personages; teaches the correct pronunciation of proper names; is a biographical dictionary of all nations; a biblical dictionary; describes every animal known to exist; acquaints you with authors, sculptors, travellers, warriors, painters, divines, historians, naturalists, etc., of ancient and modern times; speaks of all the battles and heroes of the late war; and explores the whole vast vegetable kingdom.

AGENTS WANTED.—Apply to F. DEWEY & CO., 542 California Street, San Francisco, General Agents for the Pacific States, and Territories. 19v21

AMERICAN JOURNAL

- OF -

Science and Arts,

(FOUNDED BY PROFESSOR SILLMAN IN 1818.)

And now numbering 100 volumes, in two Series of 50 volumes each.

Editors and Proprietors: Professors SILLMAN and DANA. Associate Editors: Professor's GRAY and Gibbs of Cambridge and NEWTON, JOHNSON, BAUSH and VERRILL of Yale.

Devoted to Chemistry, Physics, Geology, Mineralogy, Natural History, Astronomy, Meteorology, etc.

A THIRD SERIES in MONTHLY numbers, making two volumes a year of about 450 pages each, from January 1871. Subscription price \$6.00 a year, or 50 cents a number.

A few complete sets on sale of the first and second series. Address

SILLMAN & DANA, New Haven, Ct. 20v21-1mra20w2m

MECHANIC ARTS COLLEGE.

UNIVERSITY OF CALIFORNIA.

Inauguration of the University Lectures in San Francisco.

A BRANCH OF THE MECHANIC ARTS College of the University has been established in San Francisco, for the instruction of all males and females engaged in mechanical or other industrial pursuits.

Instruction will be given by means of a series of Lectures by the several Professors of the University—each in his speciality—assisted by other gentlemen eminent in the ranks of science. These Lectures will be illustrated by the valuable apparatus of the University.

PROFESSOR JOSEPH LE CONTE

Will inaugurate the exercises by a course of Lectures on

Geology and the Coal Measures of the Pacific Coast,

The first of which will be delivered in the Hall of the Mechanics' Institute, Post Street,

On Saturday Evening November 12, At 7 1/2 o'clock P. M.

The Lectures will be continued on each succeeding Saturday evening at the same time and place.

PROF. JOSEPH LECONTE will follow with a series of Lectures on INDUSTRIAL MECHANICS; PROF. E. S. CARR on CHEMISTRY, and the other Professors on practical subjects connected with their Departments.

All are invited to attend—free of charge—and those who record themselves as regular Attendees, will be enrolled as Students-at-large of the Mechanic Arts College of the University.

MARTIN KELLOGG, Dean of the Faculty.

PATENT

Floating Bridge, Floating Light House, etc.

For rights to use or build, Address THOMAS SCHOFIELD, Grass Valley, California.

L. P. MCCARTY, traveling agent for the SCIENTIFIC PRESS, informs us that he is having first rate success in getting subscribers for that valuable journal. Success to him and it.—Mt. Messenger.

Metallurgy and Ores.

A. T. GREEN, COMMISSION MERCHANT,

No. 3 Front Street San Francisco

Agent for SAMPLING, CRUSHING, ASSAYING and SELLING OF ORES. Shipments received from miners, and the entire business transacted with promptness and accuracy. MERCHANDISE of all descriptions purchased and shipped on Commission for Country Merchants. Consignments of PROVISIONS received and sold at the highest market prices.

Refers, by permission, to Jas. Linforth, of Linforth, Kellogg & Co.; Jona. Hunt, Prest, Pacific Insurance Co.; A. J. Ralston, Sec. Pacific Insurance Co.; Jos. A. Donohoe, of Donohoe, Kelly & Co.; Falkner, Bell & Co.; Badger & Lindenberg; Taffie & Co., and J. B. Roberts, Esq. 23v20-3m

MORRIS & WHITE,

Practical Assayers and Metallurgists,

No. 30 and 36 Fremont Street,

SAN FRANCISCO.

Ore of all kinds worked by Pan Amalgamation, Chlorination, or Smelting—guaranteeing to work as close to the Fire-assay as any persons on the Pacific Coast. Gold and Silver Ores and Sulphurets bought. 12v20-4y

CALIFORNIA ASSAY OFFICE

(Successors to Geo. E. Rogers)

No. 512 CALIFORNIA STREET,

One door west of Montgomery.

H. H. LAWRENCE, Manager.
J. A. MARS, Assayer.

Analysis of Ores, Minerals, Waters, etc. 10v20

G. W. STRONG.

W. L. STRONG.

G. W. STRONG & CO.

Metallurgical Works,

No. 10 Stevenson Street, near First.

Ores worked and Tests made with care. Also, Assays of Gold, Silver, Copper, Lead, Tin, and other Metals.

LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

Assayer and Metallurgical

CHEMIST.

No. 611 Commercial Street,

(Opposite the U. S. Branch Mint.)

SAN FRANCISCO, CAL. 7v21-3m

LOUIS FALKENAU,

STATE ASSAYER,

Analytical and Consulting Chemist,

421 Montgomery St. up stairs.

Particular attention given to the Analysis of Ores, Minerals, Metallurgical Products, Mineral Waters, Soils, Commercial Articles, &c.

One or two pupils can receive theoretical and practical instruction in Assaying, Analysis, or any particular branch of chemistry at the laboratory. 11v21-3m.

RODGERS, MEYER & CO.,

COMMISSION MERCHANTS,

ADVANCES MADE

On all kinds of Ores, and particular attention

PAID TO

CONSIGNMENTS OF GOODS,

4v16-3m

HENRY G. HANKS,

Assayer and Chemist,

AND DEALER IN

Fine Chemicals, Pure Reagents, Minerals, Fossils, Etc. P. O. Box, 1180. 649 Clay Street, San Francisco.

MANGANESE.

For sale—Ground Manganese of superior quality, in quantities to suit; warranted over 70 per cent. per oxide. Apply to THOMPSON & MURRAY, 20v21-3m 507 California Street.

The Merchants' Exchange Bank

OF SAN FRANCISCO.

Capital, One Million Dollars.

A. N. COLEMAN, President.
R. H. VAN BRUNT, Cashier.

BANKING HOUSE,

No. 415 CALIFORNIA STREET. 25v20-4y

ENGRAVING ON WOOD

DESIGNING AND ENGRAVING on wood and for electrotype cuts of every description, done by superior artists at the office of the SCIENTIFIC PRESS. Fine Cuts made for Book and Newspaper Illustrations, and for Fancy Labels for printing in various colors; Monograms, Seals, &c., etc. Prompt execution and reasonable prices.

DEWEY & CO., No. 414 Clay street, S. F.

Thursday Evening.

Owing to the time necessary to mail the present large edition of the SCIENTIFIC PRESS, we are obliged to go to press on Thursday evening—which is the very latest hour we can receive advertisements.

Geology and Coal Measures.

In the Mechanic Arts College, last Saturday, Prof. Joseph Le Conte delivered the introductory lecture of his course on the Coal Measures. The first was naturally general in character. The speaker called nature a divine book; science the interpretation of that book, which the votary of science seeks to read carefully, reverently and without prejudice. Nature is a grand harmony, of which, however, the finite mind can catch but broken strains. Some think the one strain the sweeter, others prefer other strains, and hence we find men devoted to different natural pursuits. The lecturer drew a most interesting and ingenious parallel between two branches of science,

Astronomy and Geology.

The two fundamental conditions of natural existence are space and time. The domain of astronomy is space; that of geology, time; in both cases there is no limit, while other sciences treat only of the finite. Astronomy measures by millions of earth-radii, geology by millions of earth-revolutions. Astronomy takes the diameter of the earth as a base-line for measurements to the sun; geology takes the present epoch as a rod for measuring tertiary time. Further, astronomy takes the diameter of the earth's orbit for measuring the distance of the fixed stars and even the nebulae beyond; geology takes the tertiary period to measure the secondary and even the palaeozoic. When telescopic vision fails, the astronomer still speculates on worlds beyond; when fossils no longer appear, the geologist still peers into older ages, and knows that all that is seen is but a fragment of the abyss of time. Astronomy fills the universe of space with figures; geology, the universe of time with events. Astronomy builds on a ground work of geometry, geology on mechanical times. The former binds objects by the law of gravitation, the latter by the law of causation.

The object of science is to establish the universal reign of law. In its history, in the intellectual progress of the world, there are two grand epochs. The one was when the idea of infinite space was first born in the mind of man, when Galileo, gazing at the stars, grasped the idea of possible worlds beyond the seen; the other when, for the first time on earth, the idea of infinite time flashed through the mind of Buffon, while studying fossils the like of which are not found at present.

The lecturer contrasted several of the important points of astronomy and geology. He contended that the former had as many vague uncertainties as the latter, and that the certainties of the second were of greater import than those of the first. Astronomy tells of the size and distance of other worlds, while geology teaches the more important points, the climate, geography and physical conditions. He also contended that the contrast was to the advantage of geology with reference to the influence on human dignity and to their comparative usefulness.

Recurring to the more immediate subject of the evening, geology, the lecturer stated his object to be to select one world of time, to describe this in a few lectures, to connect it with the present epoch, and to draw some practical conclusions. He had selected

The Coal Age.

On account of the distinctness with which it can be depicted, and with its own climate, animals, plants, etc., and also partly on account of reasons of usefulness.

Geological history can be divided into five eras which, with the corresponding ages, are denoted in the following table:

ERAS	AGES
Recent.....	Man
Kainozoic.....	Mammals
Mesozoic.....	Reptiles
Palaeozoic.....	(Coal) Plants
	Fishes
	Mollusks
Azoic.....	Azoic

The earlier eras have names which mean, respectively, "without life" (azoic) as no fossils were known to exist in this era, when the name was given; "ancient life," the forms of the greater portion of the living tribes being peculiarly ancient; "middle life" (mesozoic) the mediæval era of geological history; and "recent life" (kainozoic) where the types are more like those now existing on the earth. The ages are denominated by the predominance of the highest or ruling classes of animals or plants. Thus, in the present (recent) era, man is the monarch; in the kainozoic, no man existed but mammals were the rulers; and so on.

But geological history does not stop here. These events alluded to are recorded in stratified rocks, which are evidently

composed of the debris of older rocks; and thus we take a step further back; and here again we find suggestions of still earlier ages, and no beginning is discovered. But as in the history of generations on earth, everything grows dimmer as we work backwards, so here our record gets more and more indistinct and uncertain.

Geology is the interpretation of the book of time. The strata are the leaves of this book, and the fossils are the hieroglyphics—the native hand-writing of Deity itself.

Where Coal is Found.

The coal age is divided into three periods:—the sub-carboniferous, the coal measures, and the Permian. The second of these alone will be here treated of, as the highest and most perfect plants are here found, and as the amount of available time for the lecture is limited. In this period is found almost all of the workable coal in the world. Below it not a particle has been discovered; and above it only a little. The recent discoveries on the Western Plains and this coast, and in China and India, have shown coal in later strata; but from 45 to 90 of all workable coal exists in these strata, leaving 1-10 to 1-5 principally for the jurassic and cretaceous and a little, as lignite, in the tertiary. This is an important fact, and the knowledge of it would have saved millions of dollars which have been spent in useless search. The sums uselessly spent in New York and in Great Britain would have sufficed for surveying both of these places most carefully several times over, and, what is more important, a knowledge of the fact would have prevented the tremendous demoralization of true, legitimate industry.

The aggregate thickness of the strata is sometimes very great. In Nova Scotia it is at least 15,000 feet; in Pennsylvania, 8,000 feet, but diminishing as one goes westward, until at the Mississippi river it is about 1,000 feet. All of this is not coal, but there occur alternating layers of sandstones, shales and limestones, with seams of coal and bands of iron ore. There is no apparent order of succession, except that each coal seam has in contact with it above black slate or shale as a roof, and below fire clay. In the former are impressions of leaves, in the latter abundance of roots,—a significant fact.

The continuity of the seams is remarkable. Some extend through whole coal fields, generally like flat cakes, thinner at the margins. Thus one is enabled to tell, in sinking at a distance, if the same seam is struck, often a point of importance, especially if the quality of coal is such as to render it much prized. Thus the Pittsburgh seam has been traced for 14,000 square miles and upwards, perhaps, to a much greater extent.

Irregularities of Strata.

The strata were at first deposited horizontally but now show all positions, having

been tilted, broken and often carried away by erosions. Consequently one finds them in basins, as mountains, etc. The lecturer showed diagrams of coal strata illustrative of this point.

A comparison, in some points, was here instituted between coal veins and metallic deposits. Coal is confined to certain periods, and never found in earlier strata than those mentioned. Veins occur in all ages, and particularly in the older ones. Veins generally break through strata, while coal always occurs between them.

The crushings, foldings and faults in coal seams often cause difficulty in working and trouble in following them. It is, therefore, an important matter to find a rule to guide the miner. One has been found which is of almost universal application in England, and answers in many cases in America. It is this: In case of a slip, the foot wall has generally gone upwards. Hence if one strikes a slip on the foot wall, one must go down for the vein; if on the hanging wall, go up. [The accompanying diagram illustrates this sufficiently well.]

The thickness of coal seams varies from that of a sheet of paper to 50, 60 or 70 feet. But in these often sand, etc., occur. Absolute pure coal probably does not occur over 12 to 15 feet thick. Generally in thicker strata, one or more seams of sand or shale are found. A coal seam below

three or two feet is not profitable to work as a rule.

The number of alternations is also very variable. We have examples of 70 in Nova Scotia, and 100 in Belgium, in one field. Examples of aggregate depth are: of 70 feet near the Mississippi river; 120 feet at Pottsville, Pa.; 100 feet in Belgium.

The best coal is generally found in the middle region, and also thicker here than above or below, which is significant with regard to its method of formation.

The San Juan Mission.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

The Old Missions.

Nothing strikes a traveler in California with a keener feeling of interest and curiosity, than the old Missions one occasionally meets with in his journeyings. The grand snow-crowned mountains, the primeval forests of gigantic trees, the deep cañons and dizzy cataracts, the immense stretch of inland valleys and the bold sea shores, are all eloquent with new teachings of wonderful and beautiful and astonishing fascination. But while the one fills us with sublime emotions, the other awakens a strange awe, a mysterious reverence and a desire to know the story of all this crumbling clay and mortar; to know under what conditions they were erected, and by what manner of people surrounded and unprotected.

Built mostly of adobe, with plastered walls that of late years have been sadly neglected, they have an ancient appearance which is not warranted by a record of time. One could as easily imagine a thousand of gloomy years had left their impression of decay, as only a hundred.

The San Juan Mission.

Arriving in San Juan on a smoky, dry, autumn day, when all nature seemed somnambulant, and the quaint old half-Mexican town stood harmoniously in keeping with its sleepy surroundings, almost our first enquiry, was about the queer old Mission that occupies the summit of the isolated mound upon which the village is built, overlooking the beautiful and fertile valley. We were referred to Father Cypr. Rubio, the parish priest, a Castilian by birth, who has resided in this State fifteen years, and has been in this parish five and a half years. We found him a most agreeable gentleman, and most kind and obliging.

From him we learned that the English name of this Mission is St. John the Baptist; also that the Mission was founded by the Franciscan Missionaries of the College of San Fernando, Mexico, on the 24th of June 1797, where the church now stands, in a place called by the natives Popeloutchom, and by the Spaniards San Benito; or in English St. Benedict. Father Fermín Francisco de Lasuen, President of the Missions of California, presided at the ceremony; Father Joseph Manuel de Martiarena and Father Pedro Adriano Martinez being the appointed first ministers of the new Mission.

Establishing Missions—Treatment of the Natives.

The way Missions were established was by erecting a cross, and celebrating mass at its foot, with due solemnity. It was then declared and proclaimed as founded. Ministers were appointed or commenced serving; but were built for priests, soldiers and servants. The soldiers, or guard, did not exceed six men in number, while the servants were generally civilized Indians, and were attached to all such establishments, as aids and assistants in reconciling and christianizing the natives.

At that time the country around was quite thickly inhabited by wild Indians who lived in numerous small villages or lodges. Before much progress could be made towards christianizing and civilizing them, it was necessary to subdue the fears, enmities and prejudices found existing among them. This work the fathers undertook with tender kindness, healing the sick, sympathizing with the afflicted, and teach-

ing the advantage of providing for future want, as well as the use of labor, the benefits of civilization and the blessings of faith in divine teachings. When we take into account the nature of these savages, and observe the work of their hands, in the buildings now standing, built under the directions of the Fathers, we can but admire the influence and controlling power obtained over them. Besides the church, the mission, as built up, originally consisted of a large square, surrounded by substantial adobe buildings with massive arched piazzas and entrances, supported by brick pillars or columns, and with burnt tile roofs, the whole comprising numerous abodes, workshops, etc.; while in case of attack from outside barbarous tribes, the stock could be securely corralled within the court.

The Large Church

In this mission is a rather dilapidated looking affair, 160 feet long by 60 feet broad, with three aisles running lengthways of the building. The central aisle only is in use; this is 28 feet wide, and the plastered ceiling, supported by brick arches, is about 25 feet from the floor, which is paved with brick. The church was first covered with tiles, but it has now a wooden roof. The interior is quite elaborately designed, and decorated with statuary, images, with paintings, etc., in accordance with the superstitions and rites of the Roman Catholic faith and worship. An immense bell that frequently reminds the indolent, of their prayers hangs close to the doorway.

On the 23d of June, 1812, just fifteen years after the establishment of this mission, the church was finished and dedicated. Father Felipe Arroyo de la Cuesta and Father Roman Fernandez were the ministers on the occasion. Up to this date there had been 1,962 baptisms, 485 marriages and 1,153 burials recorded in the book, as administered according to the faith. The tribes of Indians which were thus brought within the ministrations of the church were *Mutesuns*, who spoke the Mutesun language. It is claimed that this tongue prevailed over quite a large extent of country. Father Felipe Arroyo de la Cuesta wrote a full vocabulary and grammar of the Mutesun language, which has been published by the Smithsonian Institute. The vocabulary comprised some 2,884 words.

Father Rubio showed us the old burying ground, adjoining the church and scarcely larger in area than the ground which the church covers. He informed us that between 4,000 and 5,000 persons had been buried in that small enclosure. That number of bodies piled within the space would lay four deep with no room to spare between them! This custom of using the same ground over and over again was common throughout the Mexican Missions. The bones dug out were returned again before the earth was filled in. There is now belonging to the church here a commodious, and beautifully situated cemetery adjoining the Protestant grounds.

WHAT IS THE CAUSE OF SO MUCH LOSS OF LIFE?—What is the deeper cause of this wide spread and lamentable destruction of human life; and, if remediable, how is it to be remedied? Obviously, the cause is want of the mental capacity of self-protection, and the sole remedy is to supply that want, which is the true work of education. We hear of the instinct of self-preservation, but the idea is erroneous; there is an instinct of love of life, but self-preservation is an affair of the reason and of knowledge. Again, there is much said about the injurious consequences of breaking the physical laws, but this is a mistaken notion; it is not the physical laws that are broken in these cases, but the laws of reason; while the great mass of accidents, from which people suffer, are simply the penal consequences of loose thinking.—*Ex.*

CURIOSITIES OF VISION.—In making up the forms last week, the small cut in the article with this heading was reversed, so that our readers may have some considerable difficulty in performing the experiment. As the cut now is, they must substitute "left" for "right" eye and *vice versa* in the directions, or, if they prefer, stand on their heads and view the cross.

SALE OF FARMS.—Two farms of 160 acres each, near Knight's Landing were sold a few days since—one for \$22 per acre, and the other for \$24.50 per acre. This, considering the manner of sale, must be considered very fair prices.

NEVADA AND CALIFORNIA PROCESSES of silver and gold extraction; for general use, and especially for the mining public of California and Nevada, by Guido Kustel, containing 350 quarto pages, and illustrated with accurate lithographic engravings, 1868. Sold by Dewey & Co., Publishers Scientific Press, San Francisco. Price \$5 (coin).

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos 25 and 27 Third Street, San Francisco. Every picture warranted to give satisfaction.

BOILER FUELING saves twenty-five per cent. of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California Street. nov12-3m

BROK TIE AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan Street. nov19-3m

THOMAS O'NEIL, Ornamental Glass Cutter, No. 10 Stevenson Street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. nov20

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAN (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms. KENTON, GASS & CO. nov21-3m

WHAT IS QUILLAYA SAPONARIA?—It is a tree, the bark of a Chilian tree, which, when macerated, a fragrant vegetable soap with cleaning and antiputrescent properties, used by any other vegetable production. This bark is a prominent constituent of the celebrated Saponato, the most popular dental preparation ever introduced in America.

"SPALDINO'S GLUE," stickiest thing out.

FROM A READER.—Duncan's Mill, Shwoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your Journal is very valuable. No better investment for \$1. Rept. B. C. B.

CONTINENTAL LIFE Insurance Co., 302 Montgomery Street, corner of Pine.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mercantile and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter Street, Lick House Block.

MARAVILLA COCOA. For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been attained until Messrs Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For housewives and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homoeopathic Cocoa and Soluble Chocolate. Stearns Mills Brick Lane, London. 5v20-1y

Mining and Company Advt's.

Every Advertisement in this journal is published throughout its entire Mining, Agricultural, Monthly and Quarterly Editions.

I. X. L. Gold & Silver Mining Company, Location of Mine Silver Mountain District, Alpine County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eighteenth day of October 1870, an assessment of one dollar (\$1.00) per share was levied upon the capital stock, of said Company, payable immediately in United States gold and silver coin, to the Secretary at his office, Pioneer Hall, 808 Montgomery Street, San Francisco, California. Any stock upon which said assessment shall remain unpaid on the nineteenth day of November 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday the seventh day of December 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Pioneer Hall (up stairs) Montgomery Street, San Francisco, California. oc 29.

Kincaid Fiat Mining Company, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 20th day of October 1870, an assessment of \$2.50 per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary San Francisco.

Any stock upon which assessment shall remain unpaid on the 21st day of November 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday the 3rd day of December, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees. D. H. CROWE, Secretary. oc22 Office 270 Clay Street, San Francisco.

Mahogany G. & S. M. Company.—Location of Works, Silver City, Owyhee County, Idaho Territory.

Notice is hereby given, that at a meeting of the Trustees of said Company, held on the second day of Nov. 1870, an assessment (\$2.00) of \$2.00 per share in United States Gold coin, was levied, payable immediately to the Secretary at the office of the company, Room No. 2, Express Building, San Francisco, California. Any stock upon which said assessment shall remain unpaid on Monday Dec. 5, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, on Dec. 10, 1870, and unless payment shall be made before, will be sold on Tuesday December 27, 1870, to pay the delinquent assessment, together with costs of advertising and expenses of the sale. G. M. RICHARDSON, Secy. Office No. 2, Express Building, San Francisco, Cal. Nov. 5

Land Purchasers' Association—Office, No. 30 Montgomery Street San Francisco.

Notice.—There are delinquent upon the shares of the following named persons on account of Assessment levied on the first day of October, 1870, the several amounts set against the names of the respective shareholders as follows:

Names.	No. Certificates.	No. Install.	Amount.
Thomas R. Hayes.....	1,2,3,4,5	3	\$20.00
Alfred H. Brown.....	9	3	30.00
J. W. Cherry.....	10	6	60.00
John Bays.....	28	8	80.00
Thomas H. Day.....	32,33	2	40.00
Gustave Scott.....	4	4	40.00
James E. Agner.....	55,56	1	20.00

And in accordance with law, and an order of the Board of Trustees, made on the first day of October, 1870, many shares of said stock as may be necessary, will be sold at the office of the Secretary, No. 304 Montgomery Street, San Francisco, on Saturday the twenty-sixth day of November 1870, at the hour of 12 o'clock M., of said day, to pay said delinquent Assessment thereon together with costs of Advertising and expenses of sale.

J. F. CROSETT, Secretary. Office 304 Montgomery Street, San Francisco. nov6

Mountain City Mining Company.—Location of Works: Copie District, Elko County, State of Nevada.

Notice.—There are delinquent upon the following described stock on account of assessment levied on the 20th day of Sept. 1870, the several amounts set opposite the names of the respective shareholders, as follows:—

Names.	No. Certificates.	No Shares.	Amount.
Best, John T.....	61	400	\$200.00
Greck, H. J.....	42	100	50.00
Read, Francis.....	62	400	200.00
Rogers, F. A.....	12	500	250.00
Rogers, F. A.....	12	200	100.00
Rogers, F. A.....	13	100	50.00
Rogers, F. A.....	14	100	50.00
Rogers, F. A.....	15	50	25.00
Rogers, F. A.....	16	50	25.00
Rogers, F. A.....	17	50	25.00
Rogers, F. A.....	18	50	25.00
Rogers, F. A.....	19	10	5.00
Rogers, F. A.....	20	10	5.00
Strong, Harvey.....	28	125	62.50
Sharp, Wm H.....	31	900	450.00

And in accordance with law, and an order of the Board of Trustees, made on the 29th day of Sept. 1870, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the sales room of the Dore & Co., No. 327 Montgomery Street, S. F., on the 25th day of November 1870 at the hour of 11 o'clock A. M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary. Office, No. 206, Front Street, San Francisco. nov12-2w

Nevada Land and Mining Company.—Location of Works: Steptoe, Johnson & Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of November, 1870, an assessment of four (4) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary at his office, Room 5, 202 Montgomery Street, San Francisco, Cal. Any stock upon which said assessment shall remain unpaid on the seventeenth day of December, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the seventh day of January, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

WM. H. WATSON, Secretary. Office, Room 5, No. 302 Montgomery Street, San Francisco, California. nov19-4t

Providence Gold and Silver Mining Company.—Nevada County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of November 1870, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 21st day of December 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before will be sold on Thursday the 5th day of Jan. 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary. Office, No. 37 New Merchants Exchange, San Francisco. nov19, 3

Silver Sprout Mining Company.—Location of Works and Mines, Kearsage District, Inyo County California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty ninth day of Aug. 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Certif.	No. Shares.	Amount.
Brown, B. L.....	11	10	2.50
Cleveland, H. H.....	24	10	2.50
Devlin, J. D.....	12	10	2.50
Davis, James H.....	20	40	10.00
Hearst, Geo.....	(unissued)	200	50.00
McLaughlin, J. W. (unissued)		1000	250.00
Mott, E. B.....	29	50	12.50
Stewart, Chas E.....	23	100	25.00
Spaulding, Geo.....	25	40	10.00
Wade, Wm N.....	(unissued)	220	55.00

And in accordance with law and an order of the Board of Trustees, made on the twenty ninth day of Aug. 1870, so many shares of each parcel of said stock as may be necessary, will be sold at public auction at the sales room of Maurice Dore & Co., No. 327 Montgomery St., San Francisco, on the first day of December 1870, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary. Office, 206, Front Street, San Francisco, California. Advertising charges \$2.00 each certificate. Oct. 29-2w

STEAM JET PUMP.

Blakelee & Williams' Patent, for Water, Oils, Acids, Etc.

The best COLD WATER PUMP for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded. Send for Circular. PARKER & HUNT.

JUST OUT.

BANCROFT'S NEW MAP OF THE PACIFIC STATES

California, Oregon, Washington, Idaho, Montana, Nevada, Utah, Arizona, British Columbia and Alaska.

Elegantly engraved on copper and colored in counties. Fifth edition, thoroughly revised and brought down to date 1870. It shows two great Overland Railroad, also the proposed Northern and Southern Pacific Railroads and their connections; also all Railroads completed and projected in California and Oregon.

Upon the same sheet, on a less scale are the maps of Alaska, and a complete Railroad map of the United States.

No other map can compare with this edition in fullness of detail, and beauty and accuracy of its topography.

An enterprise of such magnitude and importance as this large and elegant copper-plate map, in order to be properly appreciated, should be in every office, school-house and dwelling. Those wishing an agency should apply immediately for terms, to

SEEDS, ROOTS AND PLANTS, can be sent carefully sealed by mail, prepaid in packages not exceeding 4 lbs, as follows: 4 oz. or less, 2 cts; 8 oz. 4 cts; 1 lb. 8 cts; 4 lbs. 32 cts. 1am

A NEW BOOK FOR MINERS.

(Issued July 1870.)

ROASTING OF GOLD AND SILVER ORES AND THE EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

BY G. KUSTEL,

MINING ENGINEER AND METALLURGIST, Author of "Nevada and California Processes of Silver and Gold Extraction," and "Lampification of all kinds of Ores."

CONTENTS:

I. INTRODUCTION.

Classification of Ores; Important Silver Ores; Difference between Real Silver Ores and Argentiferous Ores; Important Combinations; Means of Desulphurization; Means of Reduction; Desulphurization of Ores Not Efficient; What a Chloride is and How Chlorination is Effected; Means of Separating the Metals from Chlorine.

II. ROASTING OF ORES.

A. Chloridizing Roasting; Necessary Amounts of Sulphurets; Amount of Salt Used; Permanent Stirring Not Essential; Signs of a Good Chloridizing Roasting; Means of Destroying Base Metal Chlorides; Steam decomposes Base Metal Chlorides; Application of Steam in Roasting; Lead has a Bad Influence; Difference in Roasting Processes; In what condition the Metals are after Roasting; Charges in Roasting.

B. Oxidizing Roasting; Chemical Changes in Roasting; What Process requires Oxidizing Roasting; Roasting Furnaces; Furnaces managed by Handwork; Reverbatory Furnaces; Simple Roasting Furnace; Double Roasting Furnace; Long Roasting Furnace; Muffle Furnace; Furnaces with Mechanical Apparatus; Revolving Hearth Furnace; Ernst's Rotary Furnace; Parker's Furnace; Buckner's Furnace; O'Hara's Chain Furnace; Stetefeldt's Furnace; Chimneys and Flues.

III. EXTRACTION OF SILVER BY LIxivATION.

C. Solving Process; Extraction of Silver; Precipitation of the Silver; Treatment of the Precipitated Silver; Precipitation of Copper; Quality of Ores fit for the Solving Process; Sulphide of Calcium; Hyposulphite of Lime; Pathe Process; Kiss Process; Pathe and Roszner Process; Kustel and Hoffmann Process; Angustin Process; Zervogel Process; The Leaching Process.

IV. EXTRACTION OF GOLD.

D. The Chlorination Process (Plattner's); Chlorination of Sulphurets and Arseniurets.

This new book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of the various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit by an author whose reputation is unsurpassed in his speciality.

Its price, considering its special character and value, is reasonable and small in comparison to the information so well rendered in its crowded pages.

Price \$2.50 coin or \$3 currency, postage free. Printed and Sold by

DEWEY & CO., Publishers and Patent Agents, Scientific Press Office, San Francisco

The Best Treatise Published. Concentration of Ores

(OF ALL KINDS,) INCLUDING THE

CHLORINATION PROCESS

FOR GOLD-BEARING SULPHURETS, ARSENIURETS, AND GOLD AND SILVER ORES GENERALLY.

By GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST,

Author of "Nevada and California Process of Silver and Gold Extraction."

With 120 Lithographic Diagrams.

Published and sold by DEWEY & CO., Publishers Scientific Press, San Francisco, 1868.

Heads of Table of Contents.

I. INTRODUCTION.—The Dressing; The Separation; Cleansing and sizing Contrivances; Rotary Sizers, etc.

II. REDUCTION.—Reduction of Ores; Description of Batteries; Details of a Battery; Speed, Curve and Order of Lifts; The Discharge of Batteries; The Feeding of Batteries; Reduction by Rolling Mills; Grinding; Pans with Plane Mullers; Pans with Conical Mullers; Pans with Tractory-Conical Mullers; Pans with Perpendicular Mullers.

III. CONCENTRATION.—Concentration of Reduced Ore; Concentration of Ore Grains, (Jigging Shuf); Movable Jiggers; Stationary Jiggers; Conical Jiggers; Rotary Machines; Concentration of Ore Sands; Assorting of Sands; Feeding of Concentrator; Stationary Concentrators; Percussion Table; Oscillating and Shaking Tables; Steady Moving Concentrators.

IV. SPECIAL CONCENTRATION.—Concentration of Gold Ores; Concentration of Silver Ores; Concentration of Lead and other Ores.

V. CHLORINATION.—Extraction of Gold from Sulphurets by chlorination; Assay ditto; Loss of Gold in Roasting; Roasting Furnaces and Operation; Roasting with Salt; Dampening of Roasted ores; Sifting; Production of Chloride Gas; Lixivation; Precipitating Vat; Precipitation cost of Process; Roasting

NOVELTY MILL AND GRAIN SEPEARATOR.

The undersigned having purchased of the Patented, WILTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEEN WHEAT, and all the small and cut kernels, such as unmerchantable wheat, is deposited in another compartment. By the use of this fan, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous DICKY Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfect in all, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The Farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an envious popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20v19-1f Supt. W. P. S. M. Co., Philadelphia.

THE
ASPHALTUM PRESSURE PIPE
COMPANY,

HAVING ERECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; its lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-1f

Gold Saving Amalgamated Plates.

Miners, Quartz Millmen—Attention.

Best quality of Silver Plated Amalgamated Plates for saving fine particles of gold, furnished at the

San Francisco Plating Works.

655 Mission Street, between New Montgomery and Third Streets, San Francisco.

E. G. DEANSTON, Proprietor.

HAVLAND, HOOPER & CO., Agents, No. 335 Pine St.

Best means yet discovered for saving fine particles of Gold. 20v21-1f

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding millers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger change. The inclined-shaped housings of the miller plate openings efficiently force the pulp directly under the millers.

It has been consistently running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver, over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

Manufactured at the Golden State Iron Works (co operative), 19 First street, S. F., Where it can be examined and further particulars be learned; or persons may apply to the inventor and patentee, Mr. C. C. STEVENSON, at the Douglas Mine, GOLD HILL, STATE OF NEVADA, where the Pans have long been in constant operation. 16v21-1f

HOADLEY'S PORTABLE ENGINES!

3 to 20 Horse Power on Carriages and Beds.

These Engines are in use all over the United States, and are regarded as the best in use. They are self-contained Engines, without the running gear and appurtenances, for driving

Saw Mills, Grist Mills, Tanneries, Machine Shops, Planing Mills, Factories &c., and for all other purposes under seventy-five horse-power, to which Stationary Engines are applied. For Agricultural uses they are unsurpassed. For Circulars or pamphlets, describing dimensions and price address

CRAIG'S PATENT

NOZZLE.

Caution to Everybody.

Be it known that the Hydraulic Chief, manufactured by F. H. Fisher, of Nevada City, Champion Nozzle, made by Phos. Watson of Nevada City, and Dictator, made by Richard Hoskin, of Litch Flat, are infringements upon our Patents dated Dec. 8th, 1865, Dec. 7th, 1869, Dec. 28th, 1869, and that suits are now pending in the U. S. Courts which involve the working principles of each of all the above named contrivances, and that we will prosecute all responsible parties who make, sell or use, without our consent, any one or either of them.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settles made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

A Valuable Improvement

—ON—

Combination Locks,

And Fastenings for Vaults and Safe doors. Invented and Patented by Kirtledge & Leavitt of this city. The improvement of which consists in the applying of a "Detachable Knob" or Wrench to the Arbors or Cylinders, passing through the door, so as to operate the Lock and Fastenings on the inside—leaving the outer end sunk or even with the surface of the door. It is made of hardened steel so as to resist the operations of the Burglar, rendering the Lock perfectly secure and safe.

All parties are hereby cautioned not to infringe on this patent, as the owners will prosecute to the full extent of the law. None genuine unless marked K & L's Patent. Manufactured and sold by

THE LOCHER STEAM PLOW according to the Butte Record, was to have been put in operation last week near Oroville. The rotary principle of the plow has not been changed in the recent improvements; but the carriage portion of the machine has been materially modified by attaching to it additional wheels, the surface of which has been much enlarged. The Lochers have struggled manfully and perseveringly in their efforts to perfect this plow, and we shall take much pleasure in recording their success.

THE SCIENTIFIC PRESS has the largest circulation of any weekly journal published West of the Rocky Mountains, independent of a daily issue. Its readers are prominent among the most intelligent, industrious and thrifty classes throughout the Pacific States and Territories.

The Scientific Press.
[Established 1860.]
A large Illustrated, Practical Scientific Pacific States Journal, devoted to Mining, Farming, Mechanic Arts And Industrial Progress.
Now in its 21st volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe; giving more VALUABLE READING MATTER than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast.

It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies post paid 10 cts. Illustrated PATENT circulars sent free on receipt of postage stamp.

GOLDEN CHARIOT MINING COMPANY, }
SILVER CITY, IDAHO TER., Oct. 18, 1870. }

Messrs. Bandmann, Nelson & Co., Agents
Giant Powder Co., San Francisco, Cal.

DEAR SIR: In reply to your late favor, I give you the following result of my working here—the cost of drifting, which cost under the old system of mining here, \$10 per foot, with the single hand system of working and Giant Powder I have reduced to a cost of \$22 per foot, and when under the old system but one foot per day was driven, my men are easily making one and a half feet.

Under the old system wining (5 feet square) cost \$35 per foot, same is now costing me \$24 75 per foot with the same difference in time as shown in drifting.
Under the old system, our mine could never be made to yield exceeding 400 tons per month; with Giant Powder and single hand drilling, I am now furnishing monthly 1,000 tons at a reduced cost of at least 33 1/2 per cent, less per ton than under the old system.

In conclusion, will state that the neighboring mines Ida Elmore and Oro Fino, influenced by results in the Golden Chariot Mine, have adopted single hand drilling and Giant Powder to the utter exclusion of double hand work, large drills and common blasting powder. In corroboration of results in Golden Chariot Mine, I refer you to the President and Board of Trustees, resident in your city. Yours, respectfully,

JOHN F. CASSELS,
Superintendent G. C. M. CO.

THE MASONIC MIRROR
Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by the M. W. Grand Lodge, F. A. M., of the State of California, at its Annual Communication, October, 1870. Whereas, In the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,

Resolved, That this Grand Lodge, recognizing in the MASONIC MIRROR, edited by Brothers Anasua W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said MASONIC MIRROR to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted. Resolved, That the MASONIC MIRROR, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The MIRROR presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

Trunnion for Steam Engines and Calenders.

With the ordinary trunnions used for steam engines and drying calenders, the expense of considerable time and trouble is necessarily involved in the removal of these when worn out. To lessen the expense and time in such cases, Mr. Thomas Hill has invented a novel construction which we here illustrate.

The trunnion in question is made of two parts. The inner part, through which the steam passes, is made with four or more projections, B, with corresponding spaces or depressions, C, between them, so that a cross section represents a sort of cross or star with blunt points. These points or projections, B, are turned off in a lathe, and a sleeve, A, is fitted to slide on over them. This sleeve is made fast to the arms, and is turned smooth on the outside, to form a journal which turns in suitable bearings.

A hole is made through this trunnion for the passage of steam, which is brought to it through the pipe, D. This pipe enters the hole in the trunnion, and is packed so as to be steam-tight.

Whenever the sleeve, A, becomes worn, it can be removed and a new one substituted, with but little delay to the engine, the cylinders of which would have to come out with the ordinary trunnions. The spaces formed by the depressions, C, in the inner part, allow a free circulation of air about the trunnion, either naturally or by blast, so that the journal is kept cool and will work better.

A trunnion thus constructed can be introduced advantageously for oscillating engines, steam-drying calenders, or in any place where it is necessary to have a joint through a movable bearing or journal. A patent for this device has been obtained through the SCIENTIFIC PRESS Patent Agency for Thomas Hill, now of Portland, Oregon.

Messrs. Haynes and Lawton claim to have the largest establishment for the sale of crockery, china-ware, plated-ware, etc., in the United States. They have recently moved into magnificent stores under the Grand Hotel, where any one can call and see for himself how well they substantiate their claims.

The mining claims of Yuba county are assessed at \$203,055.

Valve Gear for Steam Engines.

The accompanying illustration shows a late California invention of which we have before made brief mention. As a simplification of the steam engine, as a device which enables one to dispense with a portion of the mechanism which has hitherto been found indispensable, it is certainly worthy the attention of mechanics and others interested in machinery. The invention has been more especially developed to apply to double oscillating marine engines, and by its use only one link and two eccentrics are necessary, in order to reverse both engines and run them in either direction, while, by a slight modification, only one eccentric will be needed. But it can be applied to other forms besides marine engines, and especially to locomotives.

thus actuated. The valve is a slide-valve, made proportionately rather large, and with rounded ends. The steam ports have a similar curve, and this gives the opportunity to make larger ports with a given steam chest. The exhaust port has sides curved from one another, thus allowing the steam to escape freely. In order to communicate motion from the valve-spindle, a short arm is keyed to it and projects downward into an opening in the top of the valve, so as to have a sort of rolling motion, resembling that of the ball-and-socket joint.

The operation of the engine is as follows: The link being moved or set by the reverse lever, so as to bring the pin of the rocker-arm, H, under the influence of either of the eccentrics on the main shaft, the rock-shaft, F, will be turned a little way, so

HILLS PATENT IMPROVED VALVE GEAR FOR STEAM ENGINES.

In the drawing, AA denote the two cylinders of an oscillating engine, to which the invention, in the present case, is applied. BB are the steam-chests and valve-chambers. The cylinders oscillate upon trunnions whose positions are denoted by CC. Supported on the frame, G, is a rockershaft, F, extending across, between and above the cylinders. At one end of this shaft is fastened a rocker-arm, H, a pin in its outer end entering the slot in the link, I, and upon this the link travels when the engine is reversed, this being effected by the reverse-lever, J, and connecting rod, K, pinned to the end of the link. Two eccentric-rods, LL, are pinned to lugs on the inside of the link, which is actuated through these by eccentrics on the main shaft.

At the opposite end of the shaft, F, from the link, is another rocker-arm, N, so formed as to have two points of attachment for the connecting rods, OO, which actuate the valves of the two engines. At the lower end of each of these rods is secured a link, P, at right angles to the rod and having a slot with a reverse curve, in which slot enters the pin, d, of a short crank or arm keyed to each valve stem, e, which is

that the valves will, through their connections, receive a different set from that given by the other eccentric, and the motion of the engine will be reversed.

A further simplification is possible, necessitating the employment of only one eccentric. In this the upper end of the eccentric-rod has a short vertical slot, so that as the pin connecting it with the link, I, is thrown from one side to the other of the link, it can travel up and down this slot. This is rendered necessary from the fact that the link, in this case, is keyed to the shaft, F, and thus communicates motion to it.

A still further simplification is possible, doing away with all links and eccentrics. In this case, the valve-stems are connected with one another by a series of levers, pinned to the frame, in such a way that the simple oscillations of the engine operate the valves.

Letters patent, dated October 11, 1870, were obtained through the SCIENTIFIC PRESS Patent Agency for Mr. Thomas Hill, of Vallejo, for these ingenious devices. Mr. Hill's present address is Portland, Oregon.

"Genuine Murillos."

Adorning and ennobling a couple of unpretending rooms on Jackson street in this city, are three wonderful pictures, whose aggregate value is counted by the hundreds of thousands of dollars. Two of these are by the celebrated Spanish painter, Bartolomé Esteban Murillo; the third is the production of a master of Murillo, Juan del Castillo.

In asserting that we have in our city two "genuine Murillos," we are making a statement which will be received with incredulity by many, as such paintings are so rare and costly and so many imitations are passed off as genuine. And as we are no professional artists, we hasten to give our authority. Premising that the pictures themselves seem most wonderful to our eyes, we make our statements on the authority of Dr. August Le Plongeon, the owner, a gentleman of high scientific attainments, who is well known in San Francisco. We cannot at present give this gentleman's proofs, and desire here merely to call attention to the existence of these pictures.

One of them is a "Purissima," of which we know of no copies or photographs. We feel unable to attempt a description of it. The beauty and expression of the female face and figure, the details of coloring and perspective, the wonderful faces of the cherubs,—all demand the pen of one who can both write and paint. Contrasted with this is the figure (almost grander than the last, in our opinion) of "San Antonio de Padua," visited in a trance by the infant Jesus. There are said to be two paintings of this subject, this one and one now in the Cathedral at Seville, Spain. As they are esteemed among the "very finest" of Murillo's productions, we may be excused from attempting any condensed rhapsodies or description in the space to which we are limited.

The third painting is a portrait of San Augustin, and is the work of Castillo, a master and a relation of Murillo, and himself of no small reputation. Castillo was born in Seville in 1584 and died at Cadiz in 1640. Murillo was baptized on January 1st, 1618, and died from the effects of a fall on April 3, 1682.

Our brief reference to the above may draw attention to these pictures. As no private individual of moderate means can afford to keep such costly gems, Dr. Le Plongeon intends taking them to Europe to sell them there, unless he can effect a sale in this country, which would seem doubtful. It would be most glorious if some public institution in the United States could purchase them and keep them on public exhibition. We hope that, at least, some one better qualified than ourselves, may inspect the paintings, and see if they are what is represented, and if they cannot be retained in America.

PATENT OFFICE.—General Duncan is to act as Commissioner of Patents, until the next session of Congress, in the place of Col. S. S. Fisher, resigned.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

All About Montana.

[CONCLUDED FROM PAGE 346.]

Summit District.

Summit is a small place about eight miles south of Virginia, up the creek. Three quartz mills have been erected here, where there are many ledges,—as the Oro Cache, U. S. Grant, Nelson, Keystone, J. How, etc. I had time enough to visit only a few of these however.

The well-known Oro Cache mine is situated about a mile below the city. The formation is granite. The ledge will average from three to three and a half feet in width. The former workings show signs of bad management as I have roughly indicated on the accompanying diagram which shows a ground plan of the mine. The old tunnel was 200 feet long and ran in somewhat in the manner shown in the drawing.

After working on this they struck the ledge and stopped it 25 feet each side. The month of the old tunnel is at A. The shaft was sunk 125 feet on the ledge. The new tunnel was started at O, and run in on the ledge 80 feet, leaving 40 feet of rock now between the end of the tunnel and the old workings. Mr. J. How has leased the lode and, by his good management, is making the thing pay. He has men at work running the tunnel and stopping, and works the ore in the McClure mill. I am told that the ore averages \$20; that upwards of 200 tons formerly taken out yielded from \$100 to \$120 per ton.

The McClure mill has a 40-horse engine (made by Morgan Orr & Co., Philadelphia) and four pair of Chili mills. These mills are about six feet in diameter and the wheels are hollow, filled inside with litharge, and weigh about 4,000 pounds. There are also 12 Frickberg harrels, but they use only a part of these which are said to have worked well. The former management here would appear to have been poor, and the mill has been closed for some time but has lately started up again. The present superintendent is Mr. P. H. Teats. I was shown here a gold brick weighing 100 ounces.

The Excelsior mill is working on ore from the Midas lode with satisfactory results. It has 15 stamps, copper plates, etc. The Postlewaite mill has been closed for the past few months but will start up in a few weeks. This has also 15 stamps.

One can't help remarking (internally, at least) on the difference between the mills here and those now turned out by our California foundries. In comparing them, these seem very old fashioned, and imperfect, although it may not be financially possible to effect great changes in them at present. But as California foundrymen make it a business to keep adding improvements and to study the matter carefully in all its details, of course they effect great and important changes which economically are vast advances, and they lead the world in the mills turned out.

Mr. John How's name has occurred several times in this letter. This gentleman is largely interested in mines and mills here (as the McClure, Excelsior and Conner) and is doing very much to develop the resources of the country. He is enterprising, energetic and able, and is taking hold and benefiting greatly the section, which has evidently suffered formerly for want of knowledge and from bad management. Mr. How is just the right sort of a man to have in such a place, and in his success the whole of the country here is most intimately interested.

Alder Gulch—Fluming.

Returning to Virginia, I passed down the creek visiting various claims worked by fluming companies. The first was that of A. C. Hall, who is working on a large scale and doing well. Then comes the Pine Grove Flume Co., and next the Highland Discovery claim owned by Messrs. Martindale, Reed, Hathaway & Co. Their flume is 1,400 feet long and 2x2½ feet in section. At this claim it is 12 feet down to the bed-rock, which is granite, and the boys seem very busy. The Summit Co. have 1,500 boxes, 18 in. x 2 feet. The bank is here from 30 to 40 feet high.

The Williams and Parker Fluming Company (Messrs. D. W. Williams, N. Parker, R. Pearce and T. T. Jones) have their location two miles from the city. They have 2,500 feet of fluming two feet square in section. They have been putting in new blocks, six inches thick, and changing the fall to 3½ inches in 12 feet, so as to get sufficient force. They have been very

successful this year, netting \$1,000 to \$2,000 (I am told) per hundred feet, old ground. Note-ware & Co. at Virginia have a gang of Chinamen at work, and many celestials are washing on their own account in the lower part of the gulch, having hought out the miners.

Alder Gulch gold varies from 846 to 850 fine. The water lasts generally from April 1st to November 1st.

We pass a quartz mining district known as Stirling, where three quartz mills (one said to have cost over \$100,000) have been put up, but are not running now. The country here is full of white quartz ledges whose croppings are plainly visible on the hills, and which promise that here a good camp will spring up at no distant day.

Notes of Travel in Sierra and Plumas Counties.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Newark.

Hepserdam, adjoining Whisky Diggings, (or Newark) is some five miles from Howland Flat. At this place a number of companies are making it lively just now. The NORTH AMERICAN Co., owned by 15 members, all personally represented, Robt. Scott, foreman, at present work 40 men; this claim (which is the representative of all in this district as to the character of the pay) is a deep channel washed quartz gravel claim, having no regular defined bed, often paying richest on the most elevated bed rock. The company have two tunnels, one running into the mountain above the other; the new one (which is the upper) is now in 1,700 feet, six feet high by four wide in the clear. With 40 men at work, this company remove 175 car loads per day, weighing one and a fourth tons per car, and averaging \$3 per car in gold. Their lower tunnel is in 2,500 feet. Both are protected for some 200 or 300 yards from the mouth by snow sheds. I understand this claim has recently been offered for sale in London. It has a frontage of 1,600 feet and extends one and a half miles in length to the center of Bunker Hill mountain.

THE READING claim, consisting of eight shares all personally represented, and superintended by Jas. P. De Noon, is next adjoining (below). They work 15 men in winter and some 25 from spring on. The claim is similar in every respect to the North American, and averages \$10 or \$12 per day to the man. The NE PLUS ULTRA claim own 1,800 feet front running back 6,000 feet. L. C. Porter is superintendent. They work four hands at present, but will soon work 12. Their tunnel is in 1,100 feet, pay all the way, which is found laying on a strata of lava cement. Several other prominent companies here and near Gibsonville are deserving of mention, but the managers refused to be interviewed upon the subject, probably for fear the internal revenue man might assess them a few dollars more (?); or else they may be about worked out, I don't know which. Near Gibsonville exists a ledge known as the SLEUPHET CLAIM where, from three different assays, three different kinds of metal have been found, viz: Gold, from \$50 to \$1,700, per ton, from one assayer; from a second, a small globule of silver; from a third, a trace of copper. I have no doubt of their all being right, the samples having been taken from different parts of the ledge. My opinion is the main body of it is copper.

Laporte and Vicinity.

Laporte is situated in the most south-westerly portion of Plumas Co., formerly belonged to Sierra, but by Act of Legislature was lately added to Plumas. It is about the same distance from Marysville as Downville; and is reached by stage from Marysville, and from Oroville, the two lines connecting at Columbus House. The same line extends on to Howland Flat, also to Quincy. The whole is owned and superintended by Dr. S. T. Brewster, one of the most enterprising men in the County. He has about 100 head of horses in daily use on this line, and polite and careful driver hold the reins, whose only failing is, (like their employer) they will tell funny stories. One exception exists, P. P. Parker, on the Quincy route, entertains his passengers by trading horses with every lady or gentleman he meets; but if he should trade four times in one trip, he would always arrive at the Station on time.

THE SECRET DIGGINGS M. Co.'s claims, 1¼ miles S. W. of Laporte, are owned by the Eberle Bro.'s and B. F. Baker. This mine is a very extensive deep channel, worked by hydraulic process. It pays very well yet, but years past it paid fabulously. They work from 15 to 25 men during water season (just now coming on) which extends until about June. They have a head-rock tunnel, 1,200 ft. long, flumed the entire length, and for 300 ft. below.

ALTURAS M. Co. work the bed of Slate creek, 1½ miles from Laporte, towards Port Wine. J. E. & D. E. Stover, C. W. Hendle and Wm. S. Packer are the proprietors. This claim is very peculiarly worked. They have a large dam running at right angles with the creek, high enough to detain all fresh arrival of tailings until such time as they want them. The dam is so constructed with gateways, as to allow them perfect control of the water, running it down the center or on either side at will. They have cut a tunnel some 200 ft. long, at the foot of their claim, through the point of a mountain at a short turn in the creek, which is 20 ft. wide by 12 ft. high. The object obtained is 8 ft. more grade, which now gives them splendid fall. They work about 50 men from April to Nov., and from 8 to 10 men the balance of the year. The pay is quite coarse, and the yield satisfactory.

A. Harris, of Laporte, is the inventor of an HYDRAULIC NOZZLE that is receiving considerable attention just now, the particulars of which, together with an illustration, were published some time since in this paper; the object of which was to provide a nozzle to throw streams of various sizes, with greater or less force, as occasion required it. The object, in my opinion, has been obtained by this invention.

Quincy and Vicinity.

Quincy, the County Seat of the Co. is about 33 miles N. E. of Laporte, and is situated, in one of the most picturesque, and beautiful valleys in the State. Four miles from Quincy, in the upper end of the valley, is situated the farm of J. W. Thompson Esq., not the largest, but probably the best cultivated in the County. His Residence and out-buildings are all that money could make them; and his farm is stocked with the best breeds of horses and cattle.

BADGER HILL MINE is situated on the north side of Spanish Creek, five miles west of Quincy. E. B. Jacks & Morris Smith & Bro. are the proprietors. This claim contains about 40 acres; the pay is found in washed gravel and boulders, from 40 to 130 feet deep, and at an elevation of 250 feet above the level of the creek. They work by hydraulic process, and have a 24-inch flume leading through a bed-rock tunnel to the claim. This is looked upon as one of the most lasting, as well as best paying placer claims of this county; it averaged \$10 per day to the hand last year. The insufficient supply of water, except during the rainy season, is the only drawback. There are near by many other hill claims, and several ravine diggings, that are worthy of note; but not having any particulars at hand I shall give them mention in a future article.

CRESCENT MILLS, in Indian Valley, 17 miles from Quincy, are superintended by M. B. Bransford, and owned by M. Marcuse of Marysville; the mill has 32 stamps, run by a 120-horse power engine. The mine consists of a ledge from ¼ to ½ a mile long and 10 ft. thick, the average pay of which is \$10 per ton. The main shaft is down 320 feet; 50 men are regularly employed; this rock is easily crushed, and big dividends are the result.

Taylorville and Vicinity.

Taylorville, an agricultural town five miles from Crescent Mills, in the north end of Indian Valley, looks as though it had been quite a place; but I imagine the height of the mountains surrounding it, and the elevation of the valley itself has chilled it and stunted its growth.

GREENVILLE, situated 5 miles S. E. from Crescent Mills, for a town of not over 50 inhabitants, is the most stirring place I have met. Several good mines are situated close by, which probably accounts for it.

KITTLE MINE, in Round Valley, about two miles from Crescent Mills, is owned by Judkins & Kellogg. They have steam hoisting works with all the new and improved machinery; their shaft is down 160 ft. The ledge is from two to 12 ft. thick. They haul their rock a mile to mill. The mill has 16 stamps, and has a capacity to crush from 24 to 30 tons per day, working about 25 men regularly. They lately struck a very rich vein, from which they are taking out good rock.

BAKER LENG, situated at Cherokee Round Valley, is owned by J. D. Compton, and superintended by H. Gregg. The length of the mine is 1000 ft. with a ledge averaging 3 ft. in thickness. This rock is crushed by the Caledonia mill (of 15 stamps) close by, run by 30-horse power engine; 25 men are regularly employed; the rock averages \$20 per ton. This mine is not for sale, therefore I volunteer an opinion that it will prove to be as rich as any in the state within one year.

QUINCY AND RENO STAGE.—Edwin Bates is the proprietor of a fine line of coaches running from here to the Summit, connecting with stages there for Reno, and the States East. Fare to the Summit, \$6; to Reno, \$10. The route is via Argentine (or Spring Garden Ranch), 12 miles from Quincy; Mohawk, 13 miles further; Gimison City (or Enreka Mills), Beckworth Valley, (13 miles), to the Summit (17 miles); or 55 miles from Quincy to the Summit, and about 30 miles farther to Reno. Forbestown, Oroville, and Cherokee, Butte Co., in my next. L. R. MC.

Mechanic Arts College.

Prof. Le Conte, in his second lecture before the Mechanic Arts College, last Saturday, treated of the distribution and origin of coal, with particular reference to the United States, a country more blessed than any other in the quantity and quality of coal, both of the coal measures and of other periods.

Coal Basins at the East.

A diagram of the coal beds in the eastern states was shown. As the beds of the Pacific coast have not been investigated sufficiently to know their extent and limits, no diagram of them can be made at present.

The Appalachian coal field is probably the most extensive and the richest in the world. It covers a large part of Pennsylvania and eastern Ohio, extending through Maryland, Virginia, Kentucky, Tennessee and a corner of Georgia and ending in Alabama. It includes all the different varieties of coal and has an area of from 60,000 to 70,000 square miles.

The Great Central basin covers large parts of Illinois and Indiana and passes to Kentucky, having an area of at least 30,000 to 40,000 square miles.

The Great Western, in Iowa, Minnesota,

Missouri, Kansas, Arkansas and Texas, has an area of at least 30,000 to 40,000 square miles.

The Michigan basin, in Michigan, has an area of about 5,000 square miles.

The Rhode Island, in Rhode Island and Massachusetts, has an area of 1,000 square miles. The coal here is rather poor and broken.

All of these belong to the period of the coal measures, and their areas amount to at least 125,000 to 150,000 square miles. But there are other beds belonging to different periods.

In Virginia there are two basins, the Richmond and the Piedmont, belonging to the jurassic. In North Carolina there are two basins, the Big River and the Dan River, also jurassic. The coal of both is excellent. The area of these basins is about 1,500 square miles.

Coal Basins at the West.

In the great western plains there are immense areas of coal. The so-called lignite beds of the upper Missouri and Yellowstone, of unknown extent and of incalculable value especially with regard to the great railroads. East of the Black Hills, between the Union Pacific and the 35th Parallel Roads, there is an area of at least 5,000 square miles. In this come the beds around Denver. Here we have seams of pure coal 12 to 13 feet thick and alternating in an aggregate depth of not less than 50 feet. In the region of the 35th Parallel R. R., through Colorado and New Mexico, is an area of not less than 5,000 square miles. At the Laramie Plains and Wahsatch Mountains, on the Union Pacific, the coal area is not less than 5,000 square miles, and probably much larger. Some of the beds are not less than 40 feet thick and are absolutely solid coal. These four last basins cover an area of at least 20,000 square miles, and belong mostly to the tertiary period.

The tertiary coal is generally called lignite or brown coal, by which is to be understood an imperfectly bituminized coal, brownish, light, holding considerable water and often sulphur, and generally with a woody structure. Now the coal just spoken of is not properly lignite, for it is thoroughly bituminized, is compact, even semi-anthracite. These beds are practically inexhaustible.

Coming to this coast we find a few beds belonging to the later periods. Not a particle of coal here or in the Rocky Mountains belongs to the true carboniferous age as far as is known. The only workable beds in this State are at Mt. Diablo and Corral Hollow. Here are several seams three to five feet thick. The Mt. Diablo beds are easily worked; the Corral Hollow coal is more broken, and worked with more difficulty. Both belong to the cretaceous period.

In Oregon we have tertiary coal at Coos Bay. In Washington Territory we find the Bellingham Bay beds, and at Vancouver's Island the Naimo coal beds. These are cretaceous or tertiary and the coal is thoroughly bituminized.

Comparative Areas and Production.

It is interesting to compare the areas of coal fields in different countries. We have seen that the extent of the coal measures in the United States is at least 125,000 to 150,000 square miles. If now we reckon the 20,000 square miles of coal beds in the Rocky Mountains, we shall be surely within bounds if we put down the whole area in the United States at 150,000 square miles. We have the following extents of coal beds.

	Sq. Miles.
United States.....	150,000
Great Britain.....	12,000
British America.....	18,000
Spain.....	3,400
France.....	1,700
Belgium.....	1,500
All Europe.....	100,000

The whole of Europe has then less than two-thirds the area contained in the United States. The production of coal for the years 1845 and 1864 in several countries was as follows:

	1845	1864
Great Britain.....	31,500,000 tons.	86,000,000 "
United States.....	4,500,000	22,000,000 "
Belgium.....	4,900,000	10,000,000 "
France.....	4,100,000	10,000,000 "

Great Britain's production in 1866 was at the rate of 100,000,000 tons. The immense amounts raised have alarmed some of the political economists, who have calculated that with the natural increase of consumption, the coal beds would be worked out, for all economically possible depths, in about 200 years. Here in the United States, there will be no necessity of economizing our coal for thousands of years.

Coal is the very alimant of manufactures and mechanical industry; coal and iron are the foundations of the industrial organization of society, and hence the basis of material or industrial civilization. If we could say that the amount of coal consumed is the index of this civilization, we should have to place Great Britain in the first place in the world. If we consider the amount of coal hidden in the earth as the measure of its possible extent, we should look to the United States as the first in the future. But we must not forget that there are other forms of civilization, and higher. This stands in somewhat the same relation to the highest forms of moral culture as the body does to the mind. A healthy state of the body is conducive to the highest mental condition. And, moreover, we should not neglect to develop our industrial civilization as a means of obtaining the highest forms, as we should cultivate a robust frame as a help to acquiring the highest mental and moral power and culture.

It is a remarkable fact that the known coal fields are nearly all in the North Temperate Zone. Although a few beds have been found in South America, Australia and even Africa, and up at Melville Island, yet nearly all are in

[CONTINUED ON PAGE 372.]

Mechanical Progress.

THE SHERMAN PROCESS OF STEEL MAKING.—London *Engineering* of Oct. 28th announces the arrival from the United States of Mr. J. Edwin Sherman, at invitation of the English Government to introduce his "process." The journal aforesaid says: "In applying his process to the purification of iron in the puddling furnace, Mr. Sherman melts his pigs in the ordinary way, and then, just at the moment that the 'boil' is commencing, he throws into the liquid metal a small packet containing certain chemicals, of which he at present keeps the composition to himself. The effect of this addition is stated to be an increased fluidity and boiling up of the metal, and a rapid throwing off of impurities, thus enabling the iron to be more rapidly 'brought to nature' and materially shortening the time occupied in the operation of puddling. The dose of chemicals is so small, and apparently so utterly inadequate to the results claimed to be produced, that it is not to be wondered at that the whole process has been regarded in many quarters with considerable incredulity. * * Mr. Sherman asserts that by his method of treatment he can produce from the common brands, without admixture of higher class pig, iron equal to the 'best' Staffordshire; and from low grades of pig, he can produce good merchantable iron of uniform quality. * * These are apparently bold statements; but the results already obtained warrant our regarding them with attention. Mr. Sherman's first trials were made at the works of Vickers, Sons, and Co., of Sheffield. The results were satisfactory, the samples showing a tensile strength of 36 tons per square inch of original section with an elongation of from 1½ in. to 1.13 in. in a length of 6 in. The breaking strain was over 60 tons per square inch. Many other trials are detailed, but the journal named prefers to leave the subject for the present without comment.

SILICATE PAINT AND "STONE ZINC."—A French establishment has recently introduced into the trade two substances called *silicate paint* and *stone zinc*. The silicate paint is a combination of soluble glass with zinc white. This can be applied to wood, gypsum, cement, stone, tiles, and almost any of the metals except iron. It is superior to oil paint, in drying more quickly and becoming extremely hard. It does not peel off nor crack, and is without smell. It is as well suited for use in the interior of buildings as externally. The stone zinc is used to give the peculiar grain-like appearance of stone to wood and other surfaces. This is extremely durable when exposed to heat, cold and moisture. It has been used in coating the roofs of houses—and, being a bad conductor of heat, is useful in reducing the temperature of the subjacent rooms. In preparing the stone zinc, about equal parts of soluble glass and of the zinc powder are employed. —R. R. Register.

MACHINE FOR MICROSCOPIC WRITING.—A correspondent of the London *Times* writes: "The most extraordinary machine in the exhibition is the one for microscopic writing. This enables a person to write in the usual way, and to duplicate his writing so small that it is invisible to the naked eye, yet with a powerful microscope every line and dot can be seen. The inventor claims that with his instrument he can copy this entire Bible twenty-two times in this space of an inch. With one of these machines, a private mark can be put on bills, that the forger can neither perceive nor imitate, but that the bank clerk knowing where to look, can at once detect."

A NEW PLAN FOR DRIVING SEWING MACHINES.—A patent has been taken out for an arrangement which is "mainly designed to be used as a means of driving sewing machines, and consists in mechanism in which the weight of the operator as thrown upon a rising and falling seat is made to set in motion a train of gearing that drives the machine, and on the operator removing his weight from said seat the latter rises, and the mechanism adjusts itself for a repetition of the driving action by the falling of this seat through the weight of the operator as brought to rest again thereon."

SLIDING DOORS.—A new thing is the furnishing the top rail with spiral springs, so that it accommodates itself not only to the expansion and contraction of the door, but also to slight obstructions upon the bottom rail.

WHERE AND WHEN THE SOLAR ENGINE WILL BE USED.—In the article by Capt. Ericsson, to which we alluded last week, he says:—"It is not proposed to apply solar engines in places where is not steady sunshine. * * * Let us merely estimate the mechanical forces that would result from utilizing the solar heat on a strip of land, a single mile in width, along the rainless western coast of America, the southern coast of the Mediterranean, both sides of the siluvial plain of the Nile in Upper Egypt, both sides of the Euphrates and Tigris for a distance of 400 miles above the Persian Gulf, and finally, a strip one mile wide along the rainless portions of the shores of the Red Sea. The aggregate length of these strips of land, selected on account of being accessible by water communication, exceeds 8,000 miles. Adopting this length and a width of one mile as a basis for computation, it will be seen that the assumed narrow belt of the suburnt continents covers 223,000 millions of square feet. Dividing this by the area necessary to produce one horse-power, we learn that 22,300,000 solar engines, each of 100 horse-power, could be kept in constant operation, during nine hours a day, by utilizing only that heat which is now wasted on a very small fraction of the land extending along some of the water-fronts of the suburnt regions of the earth.

It will be said that these extravagant figures are devoid of practical significance. Due consideration, however, cannot fail to convince us that the gradual exhaustion of the coal-fields will inevitably cause great changes in regard to international relations, in favor of those countries which are in possession of continuous sun-power. Upper Egypt, for instance, will, in the course of time, derive signal advantage, and attain a high political position, on account of her perpetual sunshine and the consequent command of unlimited motive force. The time will come when Europe must stop her mills for want of coal. Upper Egypt, then, with her never-ceasing sun-power, will invite the European manufacturer to remove his machinery and erect his mills on the firm ground along the sides of the alluvial plain of the Nile, where sufficient power can be obtained to enable him to run more spindles than a hundred Manchester."

RUBBER TIRES FOR CAR WHEELS.—Mr Robert Fawcett, of London, has applied for a patent. "He forms the rim and tire of a railway engine or carriage wheel of considerable breadth to receive an india-rubber ring or tire, which must be of sufficient section to sustain the weight brought to bear on it. The metal tire the inventor forms with a small additional flange on the outer edge to keep the india-rubber tire on the wheel, the ordinary flange being provided at the inner edge to keep the wheel on the track. He makes the flange of considerably greater depth than usual."

ANOTHER STEAM BRAKE.—J. Sterling, of Kilmarnock, Scotland, has applied for a patent for a device which is thus described:—"Steam from the locomotive boiler is conveyed by piping under the carriage into cylinders. Each cylinder is fixed to the framing in a vertical position, and its piston rod is connected to the brake levers, the brakes being applied by admitting the steam under the piston to lift it. An escape valve is fitted into the bottom of each cylinder, and is loaded by a spring or otherwise to a pressure which, taking the area of the piston into account, is considered the maximum to which the brakes should be subjected."

STEAM GUNS.—Mr Bessemer has invented a plan for discharging one thousand bullets per minute through a single barrel by means of steam. *Engineering* says: "The trials so far made have been carried out with a gun having a barrel of 13-16 in. bore and but twenty-one inches long, firing bullets weighing 2 oz., and supplied with steam at 50 lb pressure by an ordinary Cornish boiler. With this apparatus, imperfect although it is in some of its details, bullets have been fired through a 2 in. deal board at a distance of 50 ft., and when fired at an iron plate at the same distance they have been completely flattened, and have been found to have lost by the particles of lead driven off in minute flakes one-eighth of their weight."

IRON RAILWAY TIES.—A Michigan man has invented a cast-iron substitute for wooden ties. It costs three dollars, and will last a life-time. The wooden one costs seventy cents, and will last only three or four years. The rail rests upon a rubber cushion, four by five inches in size.

Scientific Progress.

GLACIATION OF BRAZIL.—We find in *Nature* for Oct. 27th a notice of Prof. Ch. Fred. Hartt's book on Brazil. The Professor has made two visits to that country; the first with the Thayer Expedition, the second during a vacation of some months. As we have occasionally referred to the conclusions of Prof. Agassiz,—also to what has been said in opposition to these conclusions,—in reference to the glaciation of that country, we quote here on that subject. "The most interesting feature in Brazilian geology is a layer of clay or loam, varying in thickness from a few feet to one hundred, and wrapping in its folds hill and valley, over vast tracts of country, including the steep slopes and summits of some of the highest mountains. All Rio de Janeiro, and all the coast provinces visited by our author, were thus covered. It has been described in Minas Geraes and San Paulo, and Prof. Agassiz has observed it in all the northern provinces as far as the Amazon valley. It covers alike the gneiss and the tertiary formations. This clay is of a red color, and is evidently formed of the materials of the adjacent and underlying rocks, but ground up and thoroughly mixed. There is never the least sign of stratification throughout its mass, although it very frequently rests on a thin layer of quartz pebbles. It contains, scattered through it, rounded and angular boulders of quartz, gneiss, and other rocks, and the surfaces upon which it rests are always more or less smooth and rounded. Our author always speaks of this formation as 'drift,' and he agrees with Prof. Agassiz that its peculiarities are such as unmistakably to indicate its glacial origin. This is truly a startling conclusion, and one which has hitherto been received in this country with some incredulity. Prof. Agassiz was thought to be glacial-mad; but if we separate his theories from his facts, and if we carefully consider the additional facts and arguments adduced by Mr. Hartt in this volume, we shall be bound to conclude that, however startling, the theory of the glaciation of Brazil is supported by a mass of evidence which no unprejudiced man of science will ignore merely because it runs counter to all his preconceived opinions. * * It must be stated that Mr. Hartt does not accept Prof. Agassiz's extraordinary hypothesis (which rests on a very slender basis of fact) of a great Amazonian glacier. He believes that the widespread beds of clays and sandstones, which Prof. Agassiz classifies as glacial, are marine, and states that they agree perfectly with the tertiary beds in other parts of Brazil. The patches of drift, with erratics in the Amazon valley, may well have been produced by detached masses from the glaciers of the Andean and Brazilian highlands, which melted and deposited their load of drift in the warm waters of the ancient Amazon."

RATE OF ASCENT OF FLUID IN PLANTS.—Dr. W. R. M'Nab writes *Nature*: "When conducting a series of physiological experiments on the transpiration of fluid by leaves, it became a matter of importance to determine the rapidity of ascent of fluid. My colleague, Prof. Church, had suggested for another series of experiments the use of lithium citrate, a salt easily taken up by plants, and one which can be detected with the greatest readiness by means of the spectroscope. Preference was given to this citrate, because of its containing an organic acid, and on this account not likely to meet with any obstruction to its passage from the tissues. This method I have used with great success. In one experiment the fluid had risen nine inches in thirty minutes, in another five and a half inches in ten minutes. This method is greatly superior to the use of coloring matters, which seem to experience considerable resistance in their passage through the vessels."

THE COMING ECLIPSE.—Prof. Peirce, Supt. of the U. S. Coast Survey, will have charge of the arrangements for observation. The expedition has been divided into two parties of twelve persons each. One, under direction of Prof. Peirce, will observe in Sicily; the other, under direction of Prof. Winlock, Director of the Observatory of Harvard University, will observe in Spain. Prof. Peirce has invited J. Norman Lockyer, F. R. S., and other eminent English physicists, to accompany either party. Mr. Lockyer says that science is of no country, and that English observers "may well be proud to join such a distinguished corps."

PROF. WURTZ ON SILICA.—This following is from Prof. Wurtz's *Chemical Repertory*: "The importance of the function of soluble and hydrated forms of silica in mineral fertilizers, like green sand, has been underrated. Though some vegetable spongiolles may be able to cause quartz to pass into solution in the sap, yet it is of course the soluble forms that are thus chiefly taken up, constituting the vegetable skeleton, as phosphate of lime the animal. Silicic acid, though so minute an ingredient in actual animal nutrition is indirectly as essential to animal life as even carbonic acid. The author has presented to the Lyceum and to the American Association, peculiar views of the relations of oxygen and carbon to life, arrived at by the *a posteriori* method of studying the chemical changes now going on, and tracing them backwards through their anterior stages. By the application of the same process to the past history of silicic acid, equally curious generalizations regarding the relations of this material (which next to oxygen is the most abundant of all) to zoic history in the past and the present, are pointed to with greater or less probability. This study is, however, as yet far more difficult and uncertain than in the case of carbonic acid, for the reason that the facts as yet established by chemical research regarding the habitudes and migrations of silicic acid, and the parts which it sustains in the grand drama of Life, are comparatively few. The pervading idea has been that this acid was pre-eminently the mineral acid, and that its study belonged therefore to mineralogy, a science in itself so great and complex that it has as yet scarcely advanced beyond the first stage, namely that of provisional classification. Prof. Wurtz believes, however, that his studies have unmistakably tended towards the conclusion, which will be startling to many, that silicic acid, as such, that is in isolated forms, *appertains in origin at least, altogether to the vegetable kingdom*, and that the tendency of chemical investigation and discovery is to confirm this conclusion."

ELASTICITY A MODE OF MOTION.—Prof. Walling read a paper upon this subject at the meeting of the American Association. We quote from an abstract in the *American Chemist*:—"This was an attempt to show that elasticity, like most of the other so-called primary properties of matter, is merely a manifestation of atomic motion, and that this is true not only in regard to gases, as is now already recognized in the dynamic theory of gases, but also in regard to liquids and rigid bodies; that in fact the rigidity of solids is a consequence of the peculiar arrangement of the atomic orbits in rings in different planes of motion, the connected orbits being made up of lines of atoms in close proximity, connected at the molecular poles in such a way as to form in each plane a sort of *lattice truss*, giving rigidity of form to the entire structure, whether a crystal or an amorphous aggregation of minute crystals. In liquids and solids, each physical molecule is supposed to be made up of at least three closed orbits or rings of atoms revolving in different planes, and forming at their intersection, six crystalline poles."

PROBABLE ORIGIN OF THE SOUTH CAROLINA PHOSPHATES.—Prof. W. C. Kerr, at the late meeting of the American Association, said in reference to these beds:—"I have seen no suggestion which is at all adequate to account for the origin of the materials which compose them,—the elimination and accumulation of such enormous quantities of phosphate of lime in so peculiar a situation. The recent discovery of the singular Brachiopod, *Lingula pyramidalis*, in the shoals along the sounds of North and South Carolina furnishes a solution of the mystery. This shell, it will be remembered, consists of phosphate instead of carbonate of lime. Its habitat is at the precise level of the Ashley River phosphates, and the shell being very fragile and left within the play of the tides in the shifting sands of the shoals, rapidly loses its form and furnishes only its solid material, to be agglomerated by some concretionary or other chemical or chemico-mechanical force into the nodular masses which are so peculiar to this formation."

TURKEY RED.—V. Wartha announces that the brilliant red color known by this name is brought about by a union of alizarine with a fatty acid, and that this compound is soluble in a mixture of ligroine, (light petroleum oil,) and ether, by which it can readily be removed from its cloth. On evaporation, a scarlet colored fatty substance remains behind, which does not show the characteristic reactions for alizarine until after fusion with caustic potassa. —*Amer. Chemist.*

Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

GLOBE.—*Miner*, Nov. 12th: Work on the mill is pushed with energy, and it is hoped the frame will be up and enclosed before the stormy season sets in. The machinery is expected by the teams now outward bound with Leviathan ore.

AMADOR COUNTY.

CONY MINE.—*Ledger*, Nov. 19th: The contract for sinking 100 feet deeper has been completed, and the owners have decided to sink another 100. They have 700 tons of rock on dump, and if the vein continues to improve as it has for the past two months, the permanency of this mine will be fully established.

HOISTING WORKS.—The new works at the Kennedy are going up like magic. The building is enclosed, and the workmen are putting in the machinery. By the end of this month they will be in operation.

KEARSING'S MILL.—This has commenced running on rock from the Cony. We learn that the capacity for crushing will be doubled without delay.

CALAVERAS COUNTY.

ITEMS.—*Chronicle*, Nov. 19th: Paul & Co., near the Junction, get good gravel. They are working a large number of hands. ... Shwv, and Brackett & Co., in Chili Gulch, are as industrious as ever. ... The tunnel and hydraulic claims in Tunnel Ridge are worked with fair results. ... The Union Shaft mine, in Corral Flat, continues to remunerate. ... Megaw & Co., on the west of Stockton Ridge, have not yet reached the channel. Their tunnel is over half a mile in length.

RICH GULCH.—All the stamps at the Palomo mill, thirty-six in number, are in motion, and the mine is paying well. The main shaft is 360 feet, at which point the lead shows fifteen feet in width. The vein is a solid body of quartz, and the entire ledge will pay handsomely. There is rock enough in sight for years. Alexander & Co., whose mine adjoins, are making it pay.

RED HILL.—The parties who contemplate taking water on are negotiating for the iron pipe. The water will have to be conducted 2,400 feet, and that amount of 7-inch pipe is bargained for. A fall of 150 feet can be obtained which will prove sufficient for sluicing and hydraulic purposes, as the gravel is easily washed.

CONDITIONAL SALE.—Lewis & Bro., of the Wet Gulch mine, near Railroad Flat, have negotiated a conditional sale of the ledge adjoining to a company of capitalists. The terms, as we learn by rumor, are as follows: The capitalists furnish \$2,000 with which to prospect the vein. When the money is expended, the capitalists are to have the privilege of purchasing if they wish. If they conclude not to buy, the lead, with the improvements, will remain the property of the present owners. The price named is \$35,000.

EL DORADO COUNTY.

ITEMS.—*Placerville Democrat*, Nov. 19th: The Centreville mines are almost idle for want of water. ... The Pochontas quartz mine, at Logtown, continues to yield immensely. ... The New York and El Dorado Co., one mile south-east of the Pochontas, have discovered a ledge four feet wide. ... A ditch on the divide on which are Georgetown, Greenwood and Centreville, would pay capitalists well. ... At Greenwood, there is not more than one-tenth of the water needed—few can get it at all. ... At Spanish Dry Diggings, the lack of water makes the camp dull, but there are plenty of rich claims there yet.

NYO COUNTY.

CERRO GORDO.—*Independent*, Nov. 14th: A month more of work will tell a big story of the mines. All the silver mines on the "Belmont side" are being further opened by deep tunnels—the Crowning Glory, Belmont, Oceola and the Wittekind among the number. Another, the Sunburst, is being prospected by an incline and drift.

FISH SPRING MINES.—McMurray's arastras are constantly in motion, netting a fair profit. For some time they have been running on tailings, but commenced last week, again, on rock from the El Dorado mine. For the past twelve months there has been shipped from these arastras gold bullion worth \$9,000. Work is prosecuted on both the El Dorado and Macedonia mines.

HOT SPRINGS AND WHITE MOUNTAIN.—We learn from the Supt. of the Owens Lake Silver-Lead Co., who returned last week from a trip to Hot Springs, that the ship-

ment of ore to Swansea for working will shortly be commenced. About ten tons from Witheril's mine in the White mountains, near the line, passed through Aurora last week for reduction in the Stetefeldt furnace at Reno. About the same quantity from McBride's, recently worked at Reno, assayed \$535 per ton, and he received 85 per cent. of the assay, which made the rock net him, after deducting expense of hauling over 200 miles and working, over \$300 per ton.

NEVADA COUNTY.

GOOD.—*Gazette*, 19th: The North Bloomfield Co. are down 250 feet with their shaft, and still in blue gravel that is yielding excellent prospects. Before they commenced, a hench of one hundred feet had been washed off, so that the gravel where they are sinking must have been originally 350 feet deep at least.

PREPARATIONS.—The Kilham at Blue Tent, are putting in their claims 500 feet of 22 inch iron pipe, and immediately below they will connect 600 feet of 16 inch. This Co. expect to use 800 inches of water. Their big blast of 1000 kegs of powder will take place on Thursday.

ROUGH AND READY.—*Transcript*, 16th: The miners in the vicinity of Randolph Flat have excellent prospects. Webster & Co., having thoroughly tested the extent and richness of the gravel, propose to put up a steam engine. The Picayune Co., adjoining, has found first rate prospects. By drifting through a solid bed of gravel and following the bed rock this Co. has ascertained that a tunnel from their cut will drain the ground. A tunnel has been run into the hill 500 feet, and the existence of the channel demonstrated. On the other side of the ridge Topsy & Co. have run in from Squirrel creek, and are drifting and washing. They have been at work on their tunnel for three years, and will commence hydraulic through it as soon as water is plenty.

SAN JUAN HILL.—Same of 19th: Davis & Bowen, owning valuable claims which have not been worked for some months will commence in a day or two. Other companies below San Juan are also about starting.

KURKA.—*Grass Valley Union* 17th: This mine for the two weeks ending Saturday, yielded \$27,500. The underground indications are that the mine will make a better run the current year than it did last. The last two weeks, yield does not include any gold from sulphurets.

WEBSTER CLAIMS.—Same of 19th: A shaft is being sunk and preparations made to place machinery on the ground at the earliest possible moment. On the Grant and Coombs claims a tunnel is being run for draining, and the prospect for both is good.

PLACER COUNTY.

GRAVES-PUNNAM MINE.—*Herald*, 19th: Work is vigorously pushed, large quantities of good quartz taken out, and every few days pockets struck, the ore from which comes from the mine nearly pure gold.

LINCOLN.—Cor. of same: There has been no mining excitement here. Still, they have struck a bed of red gravel near Dancetown, commencing on the Baker ranch, and extending two miles down towards the plains, which prospects well. It underlies the old surface diggings that have been worked off years ago. After working to the pipe clay, and in some places cement, the miners thought it worked out; but on sinking deeper they have struck this bed of gravel, which, if it continues as it now prospects, will give employment to hundreds of men for years.

SIERRA COUNTY.

SIERRA VALLEY.—Cor. of *Messenger*, Nov. 19th: The mining excitement at Antelope Neck, seems to be the most prominent subject just now. A town has been laid out, and parties are getting out rock for test at Reno.

SISKIYOU COUNTY.

QUARTZ ON PROVIDENCE HILL.—*Yreka Union*, 16th: We learn from J. Watson just from a visit to the mines in the Pit River country, that preparations are made for extensive prospecting. Work on his ledge has been continued with satisfactory results. The ledge is eight feet in thickness and shows gold throughout. From its position with reference to the rich placer mine of Ehlers & Co., and the character of the gold, there can be little doubt that it has been supplied from this ledge.

TRINITY COUNTY.

CANYON CITY.—Cor. of *Journal*, Nov. 19th: D. McElduff is drifting on Hyke's Hill and making \$8 to \$20 per day. Chas. Wilson, above, makes good wages. Hugh McIntyre has struck it again and is making \$17 per day. There will be eight hydraulics running on Red Flat the coming Win-

ter; each from 145 to 200 feet pressure. Among the good claims I will mention those of Morse & Co., C. Dannenbrink, Mr. Berger and S. Obermeyer. H. C. Wilt has nearly completed 900 feet of iron pipe and will soon be ready for water. Soldier Mitchell is drifting and makes \$3 per day, on the lower end of Red Flat. Hard Scrabble Bar, just below McGillivray's dam, is turning out rich. John Franklin has struck a good thing opposite the Scrabble hoys. Justice Flowers & Co. have put their ditch in thorough repair for the winter.

DOUGLAS CITY.—S. I. Thayer says the miners are well fixed for work the coming winter and only await the rains.

Nevada.

COPE DISTRICT.

ITEMS.—*Elko Chronicle*, Nov. 20th: We learn that the Norton mill is making a very successful run on Excelsior ore. Vance's mill was to start yesterday. This is on the principle of the Chili mill, with improvements.

The *Independent* of 16th says that Mountain City is not in a very flourishing condition just now. The larger portion of its population have left for the winter.

ESMERALDA.

PINK GROVE.—*Enterprise*, 16th: A gentleman just in informs us that all the mills are in full blast, and the mining companies doing well. About a week ago the Wheeler Co. struck an exceedingly rich deposit of ore in their lower tunnel. Since then they have been raising a shaft in the new body and find it wonderfully rich as far as they have gone. Their bullion is worth \$11 per ounce.

HUMBOLDT.

NORTH STAR.—*Silver State*, 19th: This mine, formerly owned by a New York Co., got in debt, was sold by the Sheriff, and bought by John C. Fall. For six months a few miners have been at work, and the mine is now sufficiently developed to warrant the belief that it is the rival of the Arizona.

STARTED UP.—The "Big Mill" which has been idle for a month, pending the consolidation of the interests of John C. Fall and the Eberhard Company, has again started up, full handed.

MINING.—All the mills in this vicinity are running up to their full capacity, some of them having ore enough to last until April. The prospects are most flattering.

BULLION.—During the current week Wells, Fargo & Co. shipped from their Unionville office 517 pounds of bullion, valued at \$5,524.

REESE RIVER.

BULLION.—*Reveille*, 18th: Last evening the Manhattan Co. shipped the last of 20 bars of silver bullion, weighing 1,799 pounds, of the value of \$29,635.

WASHOE.

YELLOW JACKET.—*Gold Hill News*, 19th: Daily yield 125 tons excellent ore, that from the north winze below the 900 foot level being of very high grade. It is worked to the depth of 54 feet, and three sets of timbers in width.

SAVAGE.—Daily yield 65 tons, nearly all from the eighth level, a few tons coming from the old north Potosi section of the upper mine. The opening of the lowest level is vigorously prosecuted.

CROWN POINT.—Daily yield 40 tons, from the upper workings of the old west ledge. The incline is down 123 feet below the 1-100-foot level, and shows lively looking quartz at the bottom.

OCCIDENTAL.—This mine is still in the grasp of the law. Meanwhile the new mill is run by Sweetapple, on ore from the Savage.

IMPERIAL-EMPIRE.—The old Alta or upper Imperial holds out, yielding 60 tons of fair ore daily, with enough in sight to last a year.

SACRAMENTO AND MEREDETH.—The usual quantity of good ore is taken daily from the upper workings, keeping the new mill running.

OVERMAN.—Daily yield 85 tons. The only item is the quarrel between this and the Caledonia about 60 feet of ground. They hold armed possession of the disputed territory.

HALE & NORCROSS.—Daily yield 140 tons. The drift east at the new lowest level has reached the vicinity of where the pay streak should be. Operations suspended for repairs.

GOULD & CURRY.—Daily yield 50 tons, from the old ore sections, which show no improvement. All work is suspended at the lowest level, and attention concentrated upon prospecting in the upper workings.

CHOLLAR-POTOSI.—Daily yield 300 tons. The old Blue Wing and Belvidere sections hold out splendidly, and a drift west at the

B street level has developed excellent ore. DANEY.—The contractors sinking the main shaft have nearly completed it to the 300-foot station, whence they will drift to the ledge.

OPINR.—Vigorous prospecting going on at the lowest level.

CALEDONIA.—The 300-foot level holds out well and the daily yield of the mine is 60 tons.

KENTUCK.—Mine still closed and lying idle.

BELCHER.—Good prospecting is being done above the 420-foot level, with increase of ore.

SIERRA NEVADA.—Running along smoothly and yielding well.

WAR.—*Enterprise*, 16th: The Overman Co. say that the Caledonians have worked over upon their ground 80 feet, at a point between their 100 and 200-foot levels. They have known of this for some time, and have been drifting to get at them. On Monday they cut through and drove them out. Yesterday the Caledonians made an effort to retake the place, but were repulsed. At the last accounts the Overland folks held the "works."

VIVIAN.—Same of 18th: The Vivian Mill, on Carson river, yesterday commenced crushing ore from the Gould & Curry mine. Five car loads were sent down yesterday.

WHITE PINE.

The *News* of Nov. 19th says that most of the mines are making extensive preparations for winter, building ore houses, sheds over shafts, etc.; that there is not one of them working which has not fair ore in sight; and not one that does not yield a profit.

ITEMS.—South Aurora keeps up the steady yield of good ore, as is evidenced by the bullion shipments. These is also a large amount of fair ore hauled to the Stanford Mill. The large ore-house is nearly finished, and work can be carried on in the mine all winter. ... North Aurora has only 15 men at work, half of them prospecting virgin ground, near the Earle, with the best indications. The others are taking out some good ore. ... In the Eberhardt, the developments are being followed up, and when wanted thousands of tons can be taken out with the least trouble. It will be like a large stone quarry. In the deep workings some of the old class of exceedingly rich ore has been found. ... Ward Beecher yields as much, and as good, rock as ever. The mine is coining money. In the O. H. Treasure, fine milling ore is coming out of the old upper workings, and the lower levels are being put in good shape. ... Fair ore coming out of Silver Wave, with plenty of low-grade in sight. Drifting still going on in the lower levels. ... Wm. Bash & Hemlock suit was decided last week in favor of a Philadelphia Co. who will immediately commence operations on a large scale. ... Anchor company is building a large ore-house over the mine.

BASE METAL RANGE.—Most of the mines are taking out ore. At Mount Ophir the Trench keeps up its reputation, taking out plenty of rich ore. ... Caroline and Amador have been making large shipments of first-class ore to England. ... Robinson is extracting fair rock. ... Mount Hope is in good ore. A drift has been run to connect with a shaft higher on the hill. ... At Carbonate City, nearly every mine is working. ... Imperial has been shut up for the winter. The mine as it stands shows immense quantities of high grading smelting ore. ... Yosemite and Uncle Sam ore is being hauled to the Power Furnace. ... Jennie A is improving daily. The force take out more rock than the two Hamilton furnaces can run through.

MILLS AND FURNACES.—At the International mill the work is pushed with all dispatch. The building is nearly finished, and during the week they will put some of the machinery in place. Mr. Tagliabue is surveying the route for the wire tram-road to connect this with the Eberhardt and North Aurora mine. ... Stanford mill, in Eberhardt, is working with good results. ... Oasis and Sheba are running on Ward Beecher ore. ... Metropolitan has ore from Chloride Flat. ... Big Smoky is working, and at the same time preparing to change to dry crushing. ... Monte Christo is running successfully on Maryland ore. The Stetefeldt furnace is working to a charm, and the whole mill is at last proving profitable. ... Tregloan's mill is working on ore from the Original Hidden Treasure. ... Powers' furnace has been running steadily, and shipped large quantities of base bullion. ... Hamilton furnaces are both running on Jennie A ore. ... Rothschild works are closed—mainly to get a supply of ore and coal on hand.

OUTSIDE DISTRICTS.—In Pinto, the Mary-

land mine ore is now worked at the Monte Christo mill, with good results. In Deep Creek, important discoveries have lately been made. A good deal of work is being done in Robinson, although no furnaces are running. In Reville, the mill has been stopped until the Sept. returns. A letter from Pioche, dated Nov. 10th, says the Crovela mine is now strongly fortified, and held by 30 armed men.

EUREKA.—*Sentinel*, Nov. 19th: Most of the furnaces are getting in winter supplies. The teams are hauling ore to them as fast as possible. The Eureka Consolidated produced, in October, 222 tons bullion, worth \$300 per ton. The two Butteport furnaces produce six tons bullion per day. The Jackson Co.'s furnaces produced in October 92½ tons bullion, worth \$350 per ton. The Separating Works of Ogden, Dunne, & Co. will be ready by Dec. 1st. The product from the mines discovered within a month would alone keep several furnaces running.

Arizona.

MARTINEZ DISTRICT.—*Prescott Miner*, Nov. 12th: It is reported that the clean-up of the ten-stamp mill at Wickenburg, running on Mayflower rock, yielded over \$100 per ton of gold worth \$20 per ounce. The mill was running on surface rock, not selected. The success of this run will probably cause the owners to put up a twenty-stamp mill.

WICKENBURG.—But one lode is being that operated upon—the "Vulture"—and is yielding rich rock enough to keep the forty-stamp mill of the Company running day and night.

WALNUT GROVE.—Parties are now at work upon ore that pays \$100 per ton. Plenty of wood and water.

BRADSHAW.—This district, 35 miles from Prescott, has the richest gold-bearing ledges ever seen, in the midst of abundant wood and water. Among the recent discoveries we have heard of the following ledges: Hidden Treasure, 30 inches in width; Star, 2 feet; Blandina, 10 feet; Oceanica, Belfast and New Era. The ledges are rich in gold; whole sides of specimens which we have seen being covered. The *Del Pasco*, the first lode opened, still keeps up its reputation.

BIG BUTTE.—The mill is running, and the mine is said to be in fine condition.

WALKER.—Some of the miners are taking out rock; the balance are doing a little placer mining.

The prospects are, that outside capitalists will soon take hold of our mines. Such are moving so far as to send experts to examine them. Sylvester Mowry will make a thorough examination of Date Creek and Martinez mines, with a view to erecting a mill, in company with San Francisco capitalists. He takes with him to San Francisco specimens of ores from Lyux Creek and Bradshaw districts for assay.

Idaho.

ITEMS.—*Avalanche*, Nov. 12th: It is estimated that 1,250 tons of ore will be taken from the Chariot mine this month. The Co. have wood enough to last eighteen months, and lumber enough on hand for a year. About 400 tons of ore will be taken from the Ida Elmore this month that will yield between \$40 and \$50 per ton. Operations have been resumed on the Potosi; the tunnel of which is being extended into the hill. Jim Miller has discovered a quartz ledge at Fairview, and asks \$1,000 for his interest.

SNAKE RIVER.—*Statesman*, Nov. 12th: The miners are discovering better pay than ever in a bed of gravel underlying the basaltic formation, and with powder and drill are opening out beds of unknown extent, and rich enough for good pay, high up the banks. Large quantities of dust are daily arriving from there.

WARREN'S.—*Walla-Walla Union*, Nov. 5th: Mr. C. Bradshaw, just down, furnishes items. The mines have been better than the average this year. About 200 white men and 500 Chinamen will winter. A rich quartz lead was discovered by Mr. B. in the course of the summer. They have had three mills in operation at Warren's during the summer, and the returns are understood to be satisfactory. Mr. Isenbeck is running one of the mills, and in working over tailings has taken out \$50 to the ton.

Montana.

CLARK'S FOUN OF THE YELLOWSTONE.—*Pick and Plover*, Nov. 12th: Reports from several points are to the effect that the mines are rich, and may moreover be worked all winter. Nuggets from there have been shown which weighed from 22 to 320.

GREATEST GOLD MINE IN THE WORLD

Under this head, the *Helena Gazette*, of Nov. 14th notes the mine of Cameron & Co. at Cable City. We quote: S. Cameron, Esq., of Cable City, arrived in Helena last night, with 975 ounces in bullion, the result of two weeks' run at the Hanaur Cable Mill. This is the largest clean-up ever made in any mill in this Territory. This mine is now in successful operation, and is unquestionably one of the richest ever discovered. A new incline has been run, striking the lead at a depth of twenty-five feet below the former level, and exposing a body of quartz which, in many places prospects as high as \$1 to the pound. The value of the above clean-up is about \$19,000.

THE NEW NORTH WEST says this clean-up was 1,020 ounces, and was from unselected rock.

PILGRIM BAR.—*New North West*, 11th: To-morrow the water will be shut off. The total yield for the season has been \$347,000. These are good diggings for the next six years. J. Catching has such faith in them, that he has bought up claims to the amount of \$34,000.

CEDAR CREEK.—Mining has nearly ceased in the gulch. The water near Forest City and above is frozen up. In Home Stake, Head-of-Oregon and Other Side and tributary gulches near the head of Cedar, eighteen inches of snow covers the ground. A small portion of the hoys will go out while the larger portion will winter here.

The *Independent* of 12th says, however, that the mines will be worked all winter. The yield of gold is fully as great as at any time during the summer. Miller & Co., at No. 66 above discovery, is the uppermost claim worked in the gulch.

New Mexico.

ITEMS.—*Press and Telegraph*, Nov. 5th: Gulch mining has ended in this vicinity. Some few parties are drifting. In lead mining there is a fair showing. The Chester Co. are sinking a shaft and tunneling. Messrs. Conly & Co., have commenced work again on the Atlantic Lode, near Last Chance. The Aztec mill, on Ute Creek, is reported paying dividends. The Chester on Humburg Gulch will start up in a few weeks. The Montezuma on Ute Creek, is yet idle. There is little prospecting going on, on account of the Grant question.

CHLORIDE DISTRICT.—Through Wm. Uesner we are enabled to verify the statement of Mr. Whitehill, in our issue of the 15th in regard to the silver lode discovered in Chloride District in Grant county, by Isaac Stevens. From 35 pwt., of the ore, Mr. Uesner returned to us 9 pwt., and 18 grs. of silver, which would net \$6,000 to the ton.

SILVER CITY.—Cor. of same: "Our great want is a good stamp mill, and whoever has the enterprise to bring the first one in, will be certain of a fortune, as there is enough rock already mined to run 40 stamps one year at least. It is the opinion of experienced men who have visited our district that it is as rich as Nevada."

Utah.

The *S. F. Bulletin* of Nov. 21st gives a history of the mines at Cottonwood, and notes the commencing rush thither. In the fall of 1868, James Woodman prospected for quartz in the Cañon, and named one of the ledges struck, the Emma. Several partners located claims with him, and organized the mining district. The ledge was narrow and the rock hard, and one by one all abandoned it except Mr. W. He stuck to it until his means gave out and then succeeded in inducing Walker Bros., of Salt Lake City, to help him with provisions and tools. One year more he toiled, and then gave it up. But by this time Walker Bros. were satisfied that it was a big thing, and so they purchased the whole. When the mine was sufficiently opened, 20 tons selected ore was sent to the Selby works, San Francisco, and returned \$21,000 in bullion. Certain San Franciscans went to Salt Lake in the same train with the bullion, and offered Walker Bros. \$400,000 in gold coin for the mine. The offer was rejected. Now comes one Lyons, representing Eastern capitalists, with an adverse claim, which is still pending.

A soldier, discharged in July, went to prospecting at once in Cottonwood Cañon, and found a ledge. On Saturday, Nov. 12th, he refused \$50,000 for his claim. He is taking out \$1,000 a week alone.

There are 15 or 20 other claims in the cañon, yielding rock worth from \$250 to \$700 per ton. Mr. Major, a well-known and reliable man, assured the *Bulletin* correspondent that these mines, including those in Tintic and other districts, were yielding 500 tons a day of ore which would pay to ship to San Francisco for reduction. The Mormons here tried to prevent the news from getting abroad. But every

train brings in men from all parts of the country, and the sidewalks of the principal streets in the city are full of men talking quartz.

New Incorporations.

The following have filed certificates with the County Clerk, San Francisco.

FALLS M. Co. Ely District, Nev.—Nov. 11. Capital stock, \$1,200,000 in 12,000 shares. Trustees: J. B. Baker, J. B. Martin, J. Mendez, R. Apple and I. Brown.

WHITE PINE WATER WORKS.—Nov. 14. Capital stock, \$500,000 in 5,000 shares. Trustees: W. B. Boura, A. Seligman, J. E. Perkins, S. W. Glazier and I. Steinhart.

IMPERIAL REAL ESTATE AND LOAN Co.—Nov. 18. Capital stock, \$50,000 in 50 shares. Trustees: W. Monahan, P. H. Quirk, R. Henry Jr., L. Hemme, G. Moffat, W. D. Heath and R. Croskey.

The following have been recorded in the Secretary of State's Office, Sacramento.

ANAHEIM R. Co.—Oct. 28. Capital stock, \$140,000 in 1,400 shares. Directors: C. R. Johnson, M. Strobel, J. Fischer, H. Kronger and F. Jorehal.

ORPHAN ASYLUM AND HOME, of the Independent Order of Barai Beith, Sons of the Covenant.—Nov. 8.

MEDICAL SOCIETY OF CAL.—Nov. 10. T. M. Logan, President; A. B. Nixon, Secretary; H. Gibbons, Jr., Ass't Secretary; G. Hewston, Cor. Secretary; A. B. Stout, Treasurer.

Meetings, Elections, Etc.

PIUTE M. Co.—Nov. 5. J. W. Gashwiler (President), H. E. Green, W. H. V. Cronise, J. Moss and A. J. Kimball. Secretary, T. F. Cronise.

GIANT POWDER Co. Trustees: L. L. Robinson, T. Varney, E. Judson, H. Brickwedel and J. N. Risdon. Secretary, H. Pichoir.

Mining Stocks.

SAN FRANCISCO, Wednesday Eve., Nov. 23.
The mining share market has been quite steady during the last week, but the amount of sales effected has been rather small. On account of the occurrence of Thanksgiving Day services, the board will not meet to-morrow (Thursday).

There were a few sales of Amador, commencing at 24¢ and ending at 24½¢. Belcher has remained steady at 2¢. The Segregated Belcher has levied an assessment of \$1 per share, delinquent December 31st. Chollar-Potosi has varied from 79 to 83. Last week the mine yielded 2,100 tons of ore, assaying \$70.40 per ton. The bullion shipment was \$51,356. On Tuesday, \$28,750 were shipped to this city. Crown Point has been very steady at 3 to 3½¢. On Saturday, \$60,000 was received.

Daney has sold steadily, the price gradually increasing from 3½ to 4½¢. Empire Mill sold on Monday and Tuesday at 4½¢ and to-day at 5. The last previous sale was on the 10th inst., when the stock brought 25 cents. Golden Chariot rose from 64 to 68, and the company reports good prospects. Thus far, \$34,625 have been received by them on November account. Gould & Curry has varied from 71 to 79, with light sales. Yield for the week ending on the 21st, 541 tons, assaying \$50.76 per ton. Hale & Norcross sold in small amounts at 196 to 102. For the week ending last Saturday, 430 tons

were raised. Kentuck sales were light at 35 to 38. Mammoth sold at 30 to 32½¢.

Meadow Valley commenced with a decline but rose again rapidly to 21½¢. The mine promises well and the company have received already over \$68,600 on November account, besides \$10,000 more, to have been forwarded to-day. Ophir has been quiet at 4 to 4½¢. Original Hidden Treasure has been quite lively, selling steadily at 8½ to 7½¢. Overman has sold at 5 to 6½¢; last week 500 tons were raised valued approximately at \$13,300. The largest sales of the week have been of Savage, which has risen from 28 to 40. The product of the mine for the past week was 640 tons, valued at \$10,800. Yellow Jacket has varied from 33 to 30.

Occidental appeared in the market on Monday, the first time for a considerable time, and 150 shares were disposed of at 1 cent. On the 2nd inst. a sale was effected at five cents. Imperial has levied an assessment of \$10 a share, delinquent Dec. 27. On Monday, assessments become delinquent of the El Dorado (Nevada) company, \$2 per share, and of the Trinidad and San Jose (Mexico), \$5 per share. By the *Montana*, on Friday, treasure was shipped to the amount of \$458,553 43, making the total shipment this year \$31,103,524 43. The shipments by rail to New York for the week amounted to \$135,941, bullion.

Kentuck M. Co.

The annual meeting of the Kentuck Mining Company was held to-day. An entirely new Board of Trustees was chosen, viz: M. J. McDonald, O. H. Bogart, H. F. Cutter, W. F. King and L. Vesaria. According to the report, the mine produced, during the year ending Oct. 30th, 18,103 tons of ore yielding \$371,198, or an average of \$20 50 per ton. Dividends have been paid to the amount of \$70,000, viz: \$20,000 each in November, December and January, and \$10,000 in February. In August an assessment of \$10,000 was levied.

PITTSBURGH has thirty-two iron, nine steel and two copper mills. The daily consumption of the iron mills is 1,200 tons, and their annual production is \$23,000,000. There are forty-eight foundries, employing 2,000 men in all, and adding \$3,000,000 per year to the wealth of our country. THE CENSUS of 1870 will cost the government \$1,750,000.

THE TOBACCO CROP.—The tobacco crop of the United States is given by the *Financial Chronicle* comparatively thus—

Hbds.	1868-69	1869-70
Virginia.....	47,000	38,000
Maryland.....	30,000	25,000
Ohio.....	16,000	16,000
Kentucky.....	90,000	65,000
Other Western.....	30,000	25,000
Total hbds.....	213,000	163,000

Cases.

New York..... 50,000 6,000
Pennsylvania..... 7,000 12,000
Ohio and Western..... 14,000 20,000

This shows a falling off to the extent of 44,000 hogsheds of Kentucky, Maryland, Virginia and Western tobacco.

The Profits of Farming.

In the two previous issues of the *PRESS* we have considered how much it costs to commence farming. The subject was examined under two conditions—commencing without capital, and commencing with capital. We now propose to consider the Profits of Farming, and this subject will also be examined from different stand points, the first of which will be that of the wheat farmer.

We would premise what we have to say, however, by a statement in which we think all who have carefully examined the subject will agree: That circumstances being equal, farming will furnish as ample a compensation for labor, and as large a profit upon investment, as any or the aggregate of the common trades in which men engage; and we would not except even the ordinary pursuits of mercantile or commercial life. If we take ten merchants with a given amount of capital, and ten farmers with a corresponding amount, we shall find that at the end of either ten or twenty years, the farmers will have the largest aggregate amount of increase; and that the same will be more equally divided among those who have earned it. And more than this, it is safe to say that fully *twenty* merchants fail in business to *one* farmer.

A comparison between mechanics and farmers will not show so marked a difference; still we think we shall be borne out in the assertion that in any given number, under similar conditions, the farmers will always have the advantage. This is the money view of the subject. If we look at the question in the matter of health and in its moral aspect, the advantages in favor of the farmer will be still greater. Such facts as these, which no one pretends to controvert, ought to open the eyes of our young men who are so much disposed to crowd the counting-house and workshop, at the expense of the farm, where their presence and services are vastly more needed.

But, turning to the special object of this article, we will endeavor to ascertain what amount of profit may be derived from wheat raising upon an outlay of \$5,625 for land (instead of \$6,250 as incorrectly printed last week), added to \$1,394 for the animals, tools, etc., required to stock such a farm. We have assumed that the land will yield an average of 30 bushels to the acre, and 25 acres will be required to sustain the farm stock, etc. We also propose to summer fallow one-third of the wheat land each year, thus leaving but 133½ acres for constant culture in wheat. We also assume that one man and a boy will do all the work of plowing, planting, hauling the produce to railroad or steamer, taking care of stock, and raising the necessary hay, etc., for their sustenance, taking care of a small garden and orchard, providing wood for the fire and keeping things in order about the farm generally. Besides this they ought to add something to its value every year, by setting out trees and otherwise improving the place. The only outside labor or other expense needed upon the farm will be at harvest time, and may be set down at \$3 per acre for cutting and threshing. The time occupied in thus harvesting 133½ acres, with proper appliances, need not exceed four or five days, during which time the farmer will be expected to board from 15 to 18 men and 12 horses. The only other expense will be seed and sacks at 12½ to 15 cents each.

Then we have 133½ acres, at 30 bushels each, yielding 4,000 bushels, or 240,000 pounds, which at 1½ cents per pound, will amount to \$3,600. Deduct for seed \$120; harvesting and threshing \$400; for sacks \$360; interest on investment, say \$625—total \$1,505, leaving a net profit for the year of \$2,095. But if by reason of an unfavorable season the crop should be reduced one-third, or to 20 bushels to the acre,

the farmer would still have the very respectable amount of \$1,015 as the sum of the net earnings for himself and boy for the year, beside a good return for his investment, to say nothing of the natural increase in value of his property, as the country is filling up around him, and opening a better, more diversified, and profitable system of farming.

Of course much hard work is involved in the above programme, but not more than can be done by one man aided by a good, stout boy. Possibly a little aid might be needed in plowing; but if the work is properly planned and pushed energetically it can be accomplished. We have in our mind instances where much more is done.

The necessary outlay for the family during this time will be very small. Of course a good farmer will produce his own small vegetables, pork, poultry, butter, cheese and eggs, and by the fourth year he ought to be able to supply his own fruit, and perhaps realise something in that way from his less provident neighbors. If properly managed, he might realise some cash for his pork, butter, cheese and eggs over and above his family use; so the amount to be drawn from the profits which we have supposed will be very small indeed. His interest account ought to furnish him with all the money he needs, and leave something to add to his profits. The only drawback to what we have named will be loss of stock by death or accident, and depreciation of farm tools. A little surplus stock, well managed, which need not interfere with his ordinary farm work, ought to fully make up any such loss. In our next we will endeavor to show the profits derivable from other branches of farming.

Cotton Culture in California.

The articles upon cotton culture in this State which have recently appeared in the *SCIENTIFIC PRESS*, the *Bulletin* and the *Call*, seem to have awakened a renewed interest in this important subject, and will undoubtedly lead to more careful and extended trials. The experiments heretofore have generally been upon a very small scale, and have been conducted under quite adverse circumstances. The seed employed has generally been of varieties not adapted to our soil and climate; and much of that employed was so badly damaged that replanting was found necessary. A lack of practical experience has also been acknowledged by several experimenters. Mistakes have been made, which have subsequently been fully recognized; but which in future experiments will be carefully avoided. The most of those who have been thus engaged have recently been comparing notes, and carefully seeking such information from each other, and from outside sources as it is hoped may lead to better success in future efforts.

The sum of our experience in this matter may be stated as follows:

First.—That the Pettel Gulf and Tennessee upland seed may be considered the safest and most profitable, and that it should be planted as early as the ground will allow.

Second.—That the low bottom and tule lands of this State are well adapted to the raising of cotton; and that we know by actual experiments, that equally good crops can be produced on selected lands, from Butte county on the north to San Diego on the south; or through a range of country from 400 to 500 miles in extent, and from the border of the sea back to the foothills of the Sierras, avoiding those portions of the coast only where fogs and cold winds prevail.

Third.—That the ordinary condition of our soil and climate require but little irrigation anywhere—none in many localities; that less water is required as a general thing, than is needed to perfect a good crop of corn.

Fourth.—That the absence of rain during the picking season in this State, enables the planter here to gather his crop entire and in good condition, while an average loss of fully fifteen per cent. from rains must be counted on in any of the Southern States.

Fifth.—Experiments thus far made show that when the proper advantage is taken of the soil and climate of California, fully double the yield per acre can be obtained here than can be realised from average culture in the Southern States.

Sixth.—The increased production, due to climate, soil, absence of insect pests, superior facilities for operating machinery, etc., etc., more than make up for the higher wages paid for labor here; so much so, that careful estimates made by Col. Stroug, of Merced, show that cotton can be produced here *cheaper* than it can be raised anywhere east of the Mississippi. Nearly twice as much cotton can be raised here to the band, by the aid of machinery, as is produced in the south by the usual appliances employed there.

Seventh.—Opinions given by unprejudiced experts at the East, and tests made by careful microscopic and chemical examinations show that the fibre and composition of California-grown cotton is decidedly superior (the same kinds being compared) to that grown in any other part of the world.

The yield of clean cotton in India is about 70 pounds to the acre; in the Southern States, 180 pounds; in California, 260.

In making our statement of yield, we have taken the estimated average yield for ten of the cotton States for the year 1867; said States averaging from 160 pounds, the lowest (Florida), to 250, the highest, (Louisiana). Small experiments in this State have shown as high a yield as 500 pounds and over to the acre.

No insects trouble the cotton in this state, while the louse, the cat-worm and the caterpillar are most destructive foes to it in the Southern States. The constant showers in the south greatly encourage the growth of weeds, the removal of which is attended with much labor and expense. This drawback is greatly lessened here, allowing their destruction by means of machinery (properly constructed cultivators) a comparatively easy task.

At the south, cotton, after being picked, has to be ginned, haled, transported to tide water or rail, shipped, and re-picked at the factory. The production of cotton in California would lead immediately to the construction of factories to work it up as fast as produced (thus introducing a new and greatly needed industry). These factory owners would buy the cotton on the plantation—in the seed—transport it, slightly compressed, to the factory, where the re-picking and shipping would be saved as well as the expense of careful baling. The seed would then be just where it would be needed for manufacture into oil and cake. The South is beginning to realise this advantage by erecting factories convenient to the cotton growing districts.

So far as finding a market is concerned, if manufactories are not established here, cotton can be shipped as directly and cheaply from California, for Europe as from Atlantic ports.

The question of rates of labor between the two sections may be nearly or quite offset by the better system of labor which prevails here. We may pay higher wages, but labor here is more regular and reliable, and is never interrupted by the weather, even for an hour. Mr. Dickson of Alabama says that the system of "shares" to which they are obliged to resort there is most pernicious in its tendency, and is an effectual bar to progress in cotton or any other kind of cultivation.

Col. Strong, of Merced, since his earlier experiments here, has spent two years in managing a cotton plantation in Arkansas, and assures us that there can be no doubt

about the superior facilities here. He is making arrangements to put in 100 acres the coming season, by which he hopes to thoroughly test the question and remove all doubts in the matter. A South Carolina gentleman, who has thoroughly informed himself on what has already been done in this State, has made a proposition to put in 1,000 acres near San Diego, if satisfactory arrangements can be made for the required land. The public spirited land holders in that section will not allow so generous a proposition to fail for want of the acres. If these experiments are made, as proposed, and carried to a successful issue, the results will be of immense importance to the Pacific Coast and to the world.

PLANTING FOREST TREES.—Mr. Jesse Eaton of Spanish Hollow informs the *Dalles Mountaineer* that he intends to set out ten acres of locust trees on his farm to be used hereafter for fencing and fire wood. Had he and hundreds of others both in Oregon and California, who own treeless farms done such a thing eight or ten years ago, they would not now be in need of small timber. If the neglect is continued the want will be largely increased at the end of the next decade. Plant trees now. It does not take fast growing trees more than eight or ten years to attain a size sufficient for almost any purpose on a farm.

HOW TO FEED PUMPKINS AND SQUASHES TO STOCK.—A farmer of some practical experience has told us how he feeds pumpkins and squashes to stock: He cuts the "fruit," open and scoops out the seeds with a ladle. The seeds are fed to his pigs, and he says they are better than barley for them. Squashes and pumpkins thus prepared are more wholesome for cattle, as the seeds are generally swallowed by them, and act injuriously upon the digestive organs.

A POTATOE FROM MONTANA.—Mr. Thomas M. Stewart, of Helena, Montana, has sent us a potatoe, raised upon his ranch in Prickly Pear Valley, which measures 18¼ inches in circumference the longest way, by a fraction over 11 the shorter, and weighs two pounds. Mr. S. writes that the tuber sent is a sample of 6,203 pounds raised from 21½ pounds of seed.

THE WHEAT CROP AT LARGE.—The agricultural report from Commissioner Capron shows that the wheat crop the present year is some 14 per cent. less than that of the previous year; but the quality is better than in 1869.

Household Reading.

Flavor and Relish in Food, Essential.

Too little consideration is generally given to the importance of flavor and relish in food; although no close observer has failed to notice that a little food, well relished, will go further in sustaining the system, than so much badly cooked or so imperfectly flavored that it cannot be eaten with a relish. Frenchmen are smaller than people of other nationalities, because they pay more attention to the relish or flavor of their food.

A common failing in flavoring food, arises from over-doing the thing. A very little nutmeg, for instance, will flavor a dish, when a very slight excess will spoil it.—Nature's flavors are exceedingly delicate.

Taste and appetite in the natural man, before the senses become vitiated by abuse, is a pretty sure safeguard to the stomach. Just so instinct is almost infallible in governing animals in the selection of their food—perhaps always so in those which have never been domesticated. We should never allow ourselves to eat anything disagreeable to the taste; food so taken will be but poorly appropriated by the system. Articles which require cooking, should be considered *done* just as soon as they have their flavor most perfectly developed. Eaten under such conditions, they afford the greatest possible amount of nutriment.

A pound of fried meat, says one who has studied up the matter, will not afford so much nutriment as a pound of broiled meat. Who does not recognize the vast superiority of flavor and relish in the one over the other; and yet how many people will put up with their fry, and—dyspepsia!

Scientists call the principle which gives relish to food and drink, *osmazome*. This principle is very volatile, and may be entirely driven off by over-cooking. It is found in everything we eat or drink.—When, by over-cooking, the "taste," or the *osmazome* is gone, we try to replace it with various flavors and condiments; hence certain mixed and re-cooked foods, as minced meat, soups from re-cooked meat, some kinds of sausages, etc., are made more palatable by the addition of condiments.

A person would undoubtedly starve to death in a very short time, with a plenty of food before him, if it was so cooked and re-cooked as to entirely remove all the *osmazome*, or smell as it may be called. His stomach would soon get such a loathing for it, that although it might be forced down by the pangs of hunger, still the system would refuse to appropriate it.

An experiment of this kind has been tried upon a dog, which was shut up with plenty of good food before him, from which, however, the *osmazome* had been so carefully extracted by cooking and re-cooking, that although the muscle and fat-making elements were left, still it had noither taste nor smell. The result was that the dog gradually pined away, until starvation was so imminent that the experiment was considered conclusive, when proper food was placed before the brute to nourish and restore him.

These things show the importance of good palatable food, properly cooked.—Even the manner of serving up food is important in this respect. Who, especially with a poor appetite, does not relish his food better when it is placed before him in a tempting, tasteful manner. Even the white cloth, and graceful manner of serving the table, add to the relish, and in just so much increase the actual nutritive power of the food. Who has not realized the fact that when food is not relished, the stomach is oppressed by its contents remaining undigested, until a little relish—either liquid or solid—is added to aid digestion. A good laugh or story, or pleasant company will also set the digestive organs thus arrested, once more to work. One will relish his food better when taken with genial companions, than when eaten solitary and alone, or in a mixed unsocial company.

The Curative Power of Music.

It was the celebrated German physician, Hof-laud, who first fully recognized the curative power of music. Frequently the life of a dying man may be saved by gentle music not too near his bedside. It is only to catch his attention and hold it with something that imparts pleasurable feelings in order to sustain him beyond the moment of supreme exhaustion, which makes the crisis of disease. Usually, however, the cars of the dying are regaled with no sweeter music than the sighs and sifflings of their sorrowing friends. Of course they are troubled, depressed, and when the critical breath comes, fail to catch it and so die. There is much in this theory.

Music as an agent for promoting health is of high value. If invalids would devote an hour or two daily to practising vocal music it would often restore them to health. Persons with weak lungs may thus ward off fatal lung disease. The effects on the body and mind are excellent.

WHAT MUSIC DOES TO WOOD.—Some authorities contend that the wood of the violin becomes changed in structure after being played upon, and is reconstructed on a finer principle, and for this reason a very old violin that has been well treated by refined playing can hardly be bought, because it has yielded up its original coarseness and obeys a divine law. When Ole Bull wished to repair his violin he waited till one day some accident in the orchestra "killed" the double bass, when he secured a portion of the wood to incorporate in his instrument. Military music converts men from a mob into a machine, and subjects their wills to the purpose of one enthusiastic moment.

Care of the Feet.

Many are careless in the keeping of the feet. If they wash them once a week they think they are doing well. They do not consider that the largest pores of the system are located in the bottom of the feet, and that the most offensive matter is discharged through these pores. They wear stockings from the beginning to the end of the week without change, which become completely saturated with offensive matter. Ill health is generated by such treatment of the feet. The pores are not repellants, but absorbents, and this foetid matter, to a greater or less extent, is taken back into the system. The feet should be washed every day with pure water, as well as the arm-pits, from which an offensive odor is emitted, unless daily ablution is practised. Stockings should not be worn more than a day or two at a time. They may be worn one day and then aired and sunned and worn another day, if necessary.

Color of Furniture.

Nothing contributes so much to enhance the beauty of a stuff intended for chairs, sofas, etc., as the selection of the wood to which it is attached; and, reciprocally, nothing contributes so much to increase the beauty of the wood as the color of the stuff in juxtaposition with it. We should assort violet or blue stuffs with yellow woods, such as citron, maple, satin-wood, etc. Green stuffs with rose or red-colored woods, as mahogany. Violet or blue-gray are equally good with yellow woods, as green-grays are with the red woods. But in all these assortments, to obtain the best possible effect it is necessary to take into consideration the contrast resulting from height of tone; for a dark blue or violet stuff will not accord so well with yellow wood as a light tone of the same colors; and it is for this reason that yellow does not assort so well with mahogany as with wood of the same color, but not so deep. Among the harmonies of contrast of tone, ebony or rose-wood permits its employment with light stuffs to produce contrasts of color. It can also be employed with very brilliant, intense colors: scarlet, aurora, flame-color, etc.

LEMON JUICE IN DIPHTHERIA.—Dr. Revillout, in a paper presented last summer to the French Academy of Medicine, asserts that lemon juice is one of the most efficacious appliances for diphtheria, and he relates that, when a dresser in the hospital, his own wife was saved by this timely application. He got three dozen lemons and gargled her throat with the juice, she swallowing a little at the same time, in order to act on the more deep-seated parts. The doctor has noted numerous cases of complete success obtained by this method of treatment.

Household Receipts.

TO ROAST A GOOSE.—Chop a few sage leaves and two onions very fine, mix them with a good lump of butter, a teaspoonful of pepper, and two of salt, put it in the goose, then split it, lay it down and dust it with flour; when it is thoroughly hot, baste it with nice lard; if it be a large one, it will require an hour and a half, before a good clear fire; when it is cooked enough, dredge and baste it, pull out the spit, and pour in a little boiling water.

POTATOE SALED.—Boil six potatoes and six onions until they are soft. The potatoes must be sliced—not mashed. Mash the onions fine, and add to the potatoes, with some pepper, salt, and a small piece of butter. Then set it over the fire again, and add a little vinegar; when hot, serve it.

WELSH RABBIT.—Cut some cheese into thin shavings, and put it in a pan with a bit of butter. Place it over a gentle fire, and stir it till the cheese dissolves. Serve it with toasted bread in the bottom of the dish.

TO CLEAN GLASS BOTTLES.—Roll up, in small pieces, some white brown or blotting-paper; then wet and seep the same, put them into the vessel, with a little lukewarm water; shake well for a few minutes; then rinse the glass with clean water, and it will be as bright and clear as when new from the shops.

DELICIOUS DROP CAKES.—One pint of cream, three eggs, and salt; thicken with fine rye till a spoon will stand upright in it, and drop on a well-buttered iron pan, which must be hot in the oven. They may be made thinner, and baked in buttercups.

WORTH TRYING?—A correspondent of the *Scientific American*, writing from Columbia, South Carolina, propounds the following: "My laundress boils a bunch of peach-leaves with her clothes to whiten them. Is it an idea, or is there any chemical action produced? The clothes are certainly very white when they come from her hands." [Would they not be white without the peach leaves?]

Mechanical Items.

HOME-MADE CHLORIDE OF LIME.—Farmers can manufacture their own chloride of lime by dissolving a bushel of salt in a barrel of water, and with the salt water, slack a barrel of lime, which should be wet enough to form a kind of paste. For the purposes of a disinfectant, this is nearly as good as that purchased at the shops and drug stores, at more than treble the expense. Buy a barrel and use it freely about the sinks and gutters, it may keep the unwelcome visitor, the doctor from your house at the season of the year, when you have other more pleasant matters to attend to.

The hardness of zinc, copper and tin alloys causes them to blunt the edge of the turning tool when in the lathe. It is said that if the point of the tool be moistened with petroleum, the work will proceed as readily as with red hot metal. Steel tempered to a light yellow has been turned with the greatest facility, by using a mixture of two parts of petroleum and one of oil of turpentine.

SOLUBLE GLASS has been successfully applied on hands of machinery to restore elasticity and polish, and is found to be better adapted for the purpose than gum arabic or similar substances. Experiments upon the leather straps of a spinning jenny proved entirely satisfactory, and as liquid quartz or soluble glass is now largely manufactured, a fair trial of it is worthy the attention of our machinists.

TO SOFTEN HAND PUTTY.—Break the putty in lumps the size of a hen's egg, add a small portion of linseed oil, and water sufficient to cover the putty; boil this in an iron vessel for about ten minutes, and stir it when hot. The oil will mix with the putty. Then pour the water off and it will be like fresh made.

EXTERIOR HOUSE VARNISH is the name of a new article which has been imported from England in small quantities during the past year.

FULMINATING silver is prepared by dissolving silver in nitric acid, then precipitating it by adding caustic potash or lime-water. The precipitated oxide of silver thus obtained is next washed with water, then drained and digested for twelve hours in cold, strong ammonia. The liquor is next poured off and the powder washed with fresh ammonia and drained on blotting paper. When dry it forms one of the most dangerous of fulminating powders; it can scarcely be touched without exploding.

Life Thoughts.

A MAN may betray the cause of truth by exhibiting unseasonable zeal.

MAKE few promises. Live up to your engagements. Keep your own secrets, if you have any.

HE has hard work who has nothing to do.

IT costs more to avenge wrongs than to hear them.

DO GOOD ALWAYS.—Be always at leisure to do a good action; never make business an excuse for avoiding offices of humanity.

SO MUCH as you excel others in fortune, so much ought you to excel them in virtue.

TRUE COURAGE.—In general, that man is a coward who shapes his course of action by his fears; and he alone is a man who dares to do right.

BE MODERATE IN PLEASURE.—Whenever we drink too deep of pleasure, we find a sediment at the bottom which polutes and omitters what we relish at first.

SITUATIONS are like skeins of silk. To make the most of them we need only to take them by the right end.

FORGET INJURIES.—The best memory is that which forgets nothings but injuries. Write injuries in the dust, and kindness in marble.

LABOR AND THOUGHT.—It is only by labor that thought can be made healthy, and only by thought that labor can be made happy.

Strike the Knot.

When we were little fellows living in California, said a man of himself and younger brothers, our father began to teach us to work, and we were anxious to perform our allotted tasks in spitting weed. A rough stick, with a most obstinate knot, tried all the skill and strength of a weak arm, and we were about to give up the task when father came along. He saw the piece of wood had been chipped down, and the knot backed, and took the ax, saying, "Always strike the knot, boys." The words have remained safe in my memory, and they are precious words. Never try to shun a difficulty, but look it right in the face, catch its eye, and you can subdue it as a man can a lion. It will cover before you, and sneak away and hide itself. If you dread difficulties, difficulties will grow upon you till they overcome you. Therefore don't chip round about the knot, but drive fair and full at it.

THE ESSENCE OF VULGARITY is the want of sensation. Simple vulgarity is merely an untrained and undeveloped bluntness of body and mind; but inbred vulgarity is a dreadful callousness, which, in extremity, becomes capable of every sort of bestial habit and crime, without fear, horror or pity. It is the blunt hand and the dead heart, in the diseased, habit hardened conscience, that men become vulgar; they are forever vulgar, precisely in the same proportion as they are incapable of sympathy—of quick understanding—of that tact which the Mimosa has in the trees, which the pure woman has above all creatures; fineness and fullness of sensation beyond reason—the guide and sanctifier of reason itself.

THE THIRD PARTY.—There is a third silent party to all our bargains. The nature and soul of things takes on itself the guaranty of the fulfilment of every contract, so that honest contract cannot come to loss. If you serve an ungrateful master, serve him more. Put God in your debt. Every stroke shall be repaid. The longer the day is withheld, the better for you; for compound interest on compound interest is the rate and usage of this exchequer.

MIND—SOUL—SPIRIT.—The mind is generally thought to be the intelligent power in man,—the power that perceives, conceives, judges, and reasons. The soul embraces all that is meant by mind, and also the sentiments and moral affections; in other words, those faculties which enable him to think and reason, and renders him a subject of moral government. Soul and spirit mean about the same thing.

BE LIBERAL.—The surest road to poverty, is to hoard up treasure. The surest road to wealth, is to bestow liberally where it is most needed. The miser is the poorest on earth; the most liberal man is the most wealthy. If, therefore, you would be rich, do not aim at riches, but simply use what you already possess for the greatest possible number.

Scientific Press.

W. B. EWER..... SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY. GEO. H. STONE.
W. B. EWER. JNO. L. BONE.

Office, No. 414 Clay St., below Sansome.

TWO EDITIONS.—We now issue a mining edition and a farming edition of the Press. The difference consists in changing the reading matter of the 6th and 7th pages. [All advertisements appear in both issues, affording an immense circulation.] Subscribers will please notify us if they do not receive the edition they prefer. Both editions furnished to one address for \$7 per annum.

Gold and Legal Tender Rates.

San Francisco, Wednesday, Nov. 23, 1870.—Legal Tenders buying @89½; selling @90¼. Gold in New York to-day 112.

Notices to Correspondents.

E. M., Watsonville, asks whether "eating the leaves of poison oak is an antidote for poisoning by the same plant. There are firm believers in this doctrine, and no less a person than the editor of the *Pacific* declares that he has tried it with success in his family. I tried it once and got a very sore mouth." We should be afraid to recommend the practice. We know of cases where extreme suffering and even death have resulted therefrom, although, on the other hand, we have tried it ourselves without injury. One of the best remedies, which has been recommended as effective even in extreme cases, has been given by medical authority as the *Grindelia*, a plant from one to three feet high with bright yellow flowers in heads one to two inches in diameter, which somewhat resembles a small sun flower. This grows often almost in the vicinity of poison oak and flowers from June to October. It may be used either by bruising the fresh herb and rubbing it on the parts affected, or, better, a strong decoction may be made, by boiling the plant in a covered vessel, and applying this decoction.

MURPHY, Virginia City, asks for information on the subject of growing and manufacturing indigo. We will furnish the information desired at an early date. COMMUNICATION received from Bull Run.

BOILER INCrustATIONS.—It has been observed that water slightly contaminated with the impurities of crude coal gas forms no scale in steam boilers. The recent discovery that red iron rust is not an oxide of the metal, but a carbonate of the sesquioxide, explain this phenomenon, and promises an effectual remedy for scale. The addition of a very slight percentage of caustic ammonia (the "aqua ammonia" of commerce) must, by neutralizing any carbonic acid present in the water, serve as an efficient and ready method of avoiding this troublesome incrustation. This is of importance, not only to those using boilers, but also especially to gas companies, who are thus promised a no mean addition to their revenues from the manufacture of the ammonia.

Railroad Matters.

Oregon.

Concerning the results of the surveys on the Northern Pacific we have heard nothing very certain of late. The difficulties of the northern part of the country seem by no means to diminish by nearer examination. As to the absence of snow in winter, the statements hitherto made appear to have no foundation on ascertained facts, while all surveys point to the fact of there being very heavy falls of snow. Last month there were withdrawn from market eighty sections of land in Oregon and Washington along a route following down the Columbia, on the north side, to Vancouver, thence one branch crossing to Portland and another proceeding down the Columbia, to a point opposite Rainier, and thence to the Sound. If the line is run, as has been suggested, southerly from Montana, through the lower part of Idaho, it will be a big benefit for that country.

Articles of incorporation of the Yaquina Bay and Willamette Valley R. R. Co. were filed November 4th. The road is to be run from Corvallis to Yaquina Bay. It was announced, at the beginning of the month, that Alvinza Hayward, of this city, had agreed to build a road from Walla Walla to a point on the Columbia, provided the citizens of Walla Walla subscribed \$100,000. The county is authorized to subscribe \$300,000. The distance is given as about 30 miles. The bill authorizing the city of Portland to donate \$300,000 of bonds to the West-Side R. R. passed the Oregon State Legislature but was vetoed by the Governor.

On the Oregon and California road, work is progressing rapidly. The grading has been completed to the one-hundred mile stake. The track is already laid for over 60 miles south of Portland and will be down for 100 miles in a short time. It has been ballasted and fully completed within a few miles of Salem. Cars are now running as far as Jefferson.

California.

On the California and Oregon road, some three hundred graders and tracklayers are employed and the track is laid at the rate of half a mile per day. The Deer creek bridge, eight miles from Tehama and 20 miles from Chico, is finished and the iron was to reach this point this week, and Tehama, it was hoped, at the end of the month. It is said that the road will be pushed on to Red Bluff immediately. The track has been raised three feet on both sides of Bear river for a distance of a mile and a half, to protect it from the possibility of an overflow. It is reported that a branch will be built from Gridley station (Butte county) to Colusa. The surveyors in the upper part of the State have finished several lines east of Mt. Shasta. According to the Yreka papers, Mr. Bates, the head of the parties on the east side, does not appear favorably impressed with that aide. Engineer Hood has run a second line from Klamath river to Siskiyou mountains.

The San Francisco and North Pacific is pushing on to Healdsburg. On the 22nd ult., the first passenger car was run from Petaluma to Santa Rosa, amid considerable enthusiasm. On the 2nd inst., the trains commenced their regular trips between these places, making two trips daily. An additional force of laborers was sent up from this city on the 22nd.

The California Pacific has been raising its embankment over the tules from the east end of the trestle work to near Sutter station in Sutter county, about five miles. The additional height thus obtained is three feet. The road has found it necessary to enlarge its freight depots, to accommodate its business.

The Central Pacific has engineers at work on the west side of the Summit, running a new line which leaves the present one on Cold Stream, passes to the north of

Truckee Knob, and regains the present route near Emigrant Gap. A tunnel three miles long is said to be contemplated and a distance of 14 to 16 miles is to be saved. A large Roundhouse is being erected at Corinne, and machine shops. Considerable trouble is still experienced in the line of burning snow-sheds. Part of the short route (at least) between Sacramento and San Francisco has been surveyed, and surveyors are now running a line from Sacramento via Maine Prairie and Collinsville.

The San Joaquin Valley road was pushed forward rapidly for a time, when the working force was transferred back to the California and Oregon road. The first locomotive ran down as far as Stanislaus county on October 11. According to the Snelling *Argus*, the first goods shipped through from San Francisco to Modesto (alias Ralston, the new town on the Tuolumne) by rail, and thence by team, reached Snelling on the 11th inst. With this road, as with the Stockton and Visalia, the matter of subsidies seems to be rather a stumbling block. The legality of such should be definitely settled.

The Stockton and Copperopolis road seems to be about to have another lease of life. There was a rumor that the California Pacific had made arrangements to build it before March 1st, 1872, when the franchise to the present parties will expire. On the 27th ult., subscriptions were taken up for paying off the indebtedness of the road, and the requisite amount was raised. The San Joaquin *Republican* declares that the completion of the road is a "forgone conclusion." On the 17th inst., the first shipment of ties, etc., for the road arrived at Stockton. We may then hope that the *Republican* is right. Since the above was written, the same paper asserts authoritatively that work is to be commenced immediately.

The Southern Pacific, also, seems on the point of a renewed life. The consolidation of the several roads, already mentioned in the Press, appears to promise well. The speedy building of the road is certainly of great importance to us. At the eastern end work is going on, and trains are already running. It was expected that the road would be open to Neosho, near the S. W. corner of Missouri this week. Lines have been run from Missouri to the Canadian river. On this end, the Company advertises for ties to be deposited along the line of the road south of Gilroy.

New Projects—Narrow Gauge.

The discussion of narrow gauge has stirred up new projects and rendered apparently more feasible old ones. We have alluded to the incorporation of a Narrow Gauge R. R. Co. previously. Gen. Banning, one of the most energetic promoters of the formation of this company, is said to be working for a narrow gauge road from Los Angeles to San Bernardino, thence through the San Geronimo Pass to La Paz and Wickenburg, in Arizona. The length of the route would be about 500 miles, and it calculated that the expense would not exceed \$10,000 to \$13,000 per mile. This would aid immensely the mining regions through which it would pass. The Los Angeles and San Pedro R. R. matters appear to be approaching a settlement with a chance of a road from Los Angeles to Anaheim. On the 28th of October the Anaheim R. R. Co. filed a certificate of incorporation. The object is to build a road from Anaheim to Anaheim Landing, a distance of 14 miles. The Directors are C. K. Johnson, M. Strobel, J. Fischer, H. Krongerand F. Jorchal.

The Nevada county papers have been warmly and ably urging the construction of a road from Colfax to Grass Valley and Nevada City, perhaps further. A company has been incorporated to build a narrow gauge road. We believe the project feasible, and that the resultant effect will be

very great. We see it stated that \$17,500 was subscribed in two hours to aid the enterprise, the other day. The *Gazette* thinks \$50,000 can easily be obtained in Nevada, and \$100,000 in Grass Valley for the projected road. The Monterey *Republican* is fighting for a narrow gauge road from Monterey to Salinas Valley. If it succeeds, it will do much for Monterey. Los Angeles is agitating the subject of a road from San Bernardino and Clark District and one to Cerro Gordo. The Los Angeles, Santa Barbara, San Bernardino and other papers are awake on the matter of roads, and if the *Inyo Independent* does devote "considerable space to road matters," it is not at all out of the way. Antioch wants a narrow gauge railroad, connecting with the Western Pacific at Santa's.

Utah—Montana—Colorado.

The Utah Central, according to rumor, has been purchased by the Central Pacific. The rumor asserts further that the intention is to push the road south through Great Salt Lake Valley, down to Sevier River Valley, thence to connect with the Kansas Pacific, thus giving it an advantage over the Union Pacific. This rumor is contradicted in the *S. F. Bulletin* "on the best authority."

Montana's first railroad incorporation has been formed. The Helena, Big Horn and Cheyenne R. R. and Telegraph Co., incorporated on the 1st inst. The proposed road will run south-east from Helena to Gallatin Valley, on to the Big Horn Mountains, to connect, at the boundary line, with the road of a Cheyenne company.

Directors were elected at Helena, on the 20th inst, and arrangements are said to have been made for an early commencement and vigorous prosecution of the road.

On the Colorado Central, two trains are run daily from Golden City to Denver, at 6 A. M. and 4 P. M., returning immediately after their arrival at Denver; time, one hour. The company advertise for proposals to grade a branch line from Ralston (between the above-named places) to Greeley, whence it is proposed to extend the line north-east to Pine Bluff, 43 miles east of Cheyenne on the U. P. The *Register* says that C. C. Welch has the contract for grading some distance west of Golden, and expects to have the track laid to Guy Gulch by May or June, and to the junction of North and South Clear Creek within 90 days thereafter. Mr. Levitt has charge of the western division. A wide gauge is taken.

The Pine Bluff Road is progressing rapidly. The completion of this and of the C. C. to Guy Gulch, says the *Transcript*, will make it possible to deliver coal at Central City for \$10 50 per ton. The Boulder *News* advocates the route from Greeley via Burlington and so on to Boulder.

The Boulder Valley Road is under contract, according to the *Register* of October 26, to be completed to the Austin coal bank within 30 days. It is contemplated continuing this road from the coal banks to Caribou, Central and Georgetown; the certificate of incorporation has been filed, and engineers have been employed to examine the routes. The Denver *News*, of same date, gives the awards of contracts for ties, pile driving for bridges, and for grading in sections 1 to 13 inclusive. The road was to be completed to the Briggs' coal mines in 30 to 40 days. The engineer in charge is R. R. Holbrook.

THE COMMENCEMENT EXERCISES of the Medical Department were held on Wednesday of last week, at Mercantile Library Hall. The degree of M. D., was conferred on Messrs. C. T. Sage, M. Briggs, J. L. Seawell, H. Buckner and J. H. Mackenzie, who are the first who have received these medical honors from our University. Mr. C. T. Sage was presented with the Toland medal, as the first student of the graduating class. A most interesting address was delivered by Prof. Carr. The occasion was one most pleasant and noteworthy.

Patents and Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING NOVEMBER 15th.

MEDICAL COMPOUND FOR CURE OF RHEUMATISM.—Andrew J. Jenkins, Virginia City, Nevada.

APPARATUS FOR THE MANUFACTURE OF SUGAR.—John William Hahn, San Francisco, Cal.

CENTER-PIECE.—Samuel Kellett, San Francisco, Cal.

CENTER-PIECE.—Samuel Kellett, San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Mechanics' Institute—Cash Premiums.

In our next we hope to be able to speak more at length in regard to the Eighth Industrial Exhibition of the Institute, to open on the second Tuesday in August, 1871, which will be more general in its scope than heretofore, and for which no exertion will be spared.

The Institute is doing every year more and more to identify itself with the interests of the Coast. The managers are now taking a step which cannot be too highly commended. They will offer premiums to the amount of THIRTY-THREE HUNDRED AND FIFTY DOLLARS for the best essays and reports on the Manufacturing Interests of California, the Timber of the Pacific Coast, the Stone of the Pacific Coast, Preserving Timber and Wood, Iron Roofing, the Currents and Tides in the Bay, the best Street Pavement, the best Drainage System for this City, Treatment of Gold and Silver Ores, Transportation of Ores and Goods over Difficult Roads, best System of Reclaiming Overflowed, Tide and Tule Lands, best Attempt to raise Ramie, Beet Root for Sugar, Cotton, Tea, Rice, Tobacco, best Design for a Cocoonery adapted to this State, and for the Best and Second Best Collection of Woods of the Coast. These premiums will be paid in cash or in engraved plate, as the successful competitor may agree. We shall speak further on the subject in our next.

THE SHEFFIELD SCIENTIFIC SCHOOL.—

The recent establishment of a professorship of mechanical engineering at this institution strikes us as a most excellent addition. Where so much dependence is being placed on our manufacturing interests, this subject rises to one of the highest importance. The advantages thus offered a young man of acquiring, under teachers who are personally interested in his advancement, a knowledge of the principles of his profession and the rules of their application under ordinary circumstances, cannot be too highly estimated. While the want of such instruction has not prevented many of indomitable industry and application from rising, it has doubtless kept back vast numbers of average qualifications. The Sheffield school has called to the chair in question Prof. Wm. F. Trowbridge, a graduate of West Point, formerly on the U. S. Coast Survey, and lately superintendent of the N. Y. Novelty Iron Works.

PACIFIC GLACIERS.—The existence of glacier markings along the western slope of the Sierra Nevada has long been known, and the recent researches of the state geological survey have shown that a very great number of these ice-streams must have formerly swept down the mountain sides. Lately parties have found on Mt. Shasta the most interesting markings, showing the courses of ancient glaciers, and have found several still existing there. Mt. Rainer has quite a large number of these, some of great extent and on all or nearly all sides.

New Water-Elevating Apparatus.

We transfer from *La Propagation Industrielle* the accompanying illustrations of a French apparatus for raising water, termed a *balance hydraulique*. The end attained by it is the same as in the well-known "Mont-

descends and the weight rises. The bottom of the vessel is furnished with valves, K, from which project downward stems having floats, L, upon their lower ends. As soon as the descent of the vessel brings the floats upon the water in the bottom of the case within which the vessel works, the valves, K, are

Fig. 1.

Fig. 2.

golfer Rim," but the mechanism and process employed are very different.

A flat annular vessel, D, works up and down within a suitable surrounding case, and is connected by rods, P, with a band, N, which passes over a pulley, O, and has at its extremity a counterbalancing weight, M. When the vessel, D, is empty, the descent of the weight, M, raises the vessel until it strikes a downwardly extending stem from the arm, C, of a valve shown at B. The lifting of the arm, C, by the upward motion of the vessel, raises the valve, B, and permits water to flow from the supply-pipe, A, into the vessel, D—the latter being filled until, the action of the weight being more than balanced, the vessel

lifted and the water flows out of the vessel, which, being thus relieved of its contents, is again elevated by the descent of the counterbalancing weight, M. By this means, it will be seen, a vertical reciprocating movement is given to the vessel.

The sustaining framing constituted by the rods, P, is connected at top to a disk, from the center of which extends downward the piston rod of a pump, the cylinder, F, of which is placed at the center of each of the two figures shown in the engraving, and which surrounds the piston, E. The reciprocating movement of the vessel therefore communicates a corresponding movement to the pump-piston, and this forces a portion of the water at the lower level, received by

the pump through a suitable valve, upward through the ascension-pipe, I, while that not thus elevated is conducted away at Q. The two figures represent the same machine, except that Fig. 1 is the more simple form, illustrating the principle of operation and general arrangement of parts, while Fig. 2 indicates a more elegant style, adapted for raising water in parks and gardens where ornamentation is more desirable than where the object sought is more strictly utilitarian.—*Am. Artisan*.

A PHILANTHROPIC ENDOWMENT.—Hon. Horace Hawes has taken a grand step for the prevention of suffering among his fellow-men to a great extent. He has conveyed, by deed of trust, to five prominent citizens of San Francisco, a large block of land, now valued at \$150,000, to be leased out, and its earnings to accumulate until \$5,000,000 are realized, which capital is to be employed in the endowment, establishment and maintenance of a philanthropic institution, dedicated and directing all its operations to the prevention of want, by means of the protection of labor and the promotion of useful industry, which establishment shall be organized and maintained under the name of the Chamber of Industry. Such an act deserves the highest commendation from our people.

LYCEUM FOR SELF-CULTURE.—This association meets every Sunday at 2 P. M., in Dashaway Hall. According to their circular, the Lyceum "seeks to supply a social want in the present period of religious transition, and is intended to bring together thoughtful and earnest persons for free conference on all the problems of life, destiny and duty. * * * We extend a cordial welcome to all, and invite every seeker for truth to aid by presence and co-operation the accomplishment of our common desire. We have no ism to establish, no system, no sect, no party, no pre-established mode of warfare on existing systems. Our purpose is to arrive at truth."

KING'S RIVER IRRIGATION DITCH.—On this, according to the *Alta*, work is to be commenced immediately, and the preliminaries of locating the line at the head of the ditch, securing the water right and obtaining the right of way for portions of the route, have already been attended to. The ditch is to start in section 29, township 13 south, range 23 east, and is to run westward and south-westward by various branches to Fresno Slough and the San Joaquin river. The work is said to be the easier as several old channels can be utilized. The length of the route on a due west line to the Fresno Slough is about 50 miles.

THE CALIFORNIA PHARMACEUTICAL Society held their regular meeting on the 14th inst. Besides other matters, a resolution was adopted, appointing a committee to consider the matter of establishing a course of 24 lectures, commencing the second week in January, and giving two weekly. The first lecture is to be on elementary chemistry, the second on chemistry, the third on pharmaceutical chemistry, and the fourth on botany.

TEST OF CALIFORNIA COALS.—In accordance with a request of a number of prominent San Franciscans, the Chief Engineer at the Mare Island Navy Yard has been directed to carefully test any California coal sent thither, free of cost to the Government, in proper quantities. Each lot must be accompanied with an invoice giving the kind and the name and location of the mine. A tabular report will be published at the termination of the experiments.

SILVER ORE AND BORAX.—The *Lower Lake Bulletin* says: We were shown a fine specimen of silver ore taken from a ledge in the chamizal hill about Lower Lake. As it is but an outcropping, it is hardly a fair indication of what further may develop. The work at Little Borax Lake is in constant operation, turning out a superior article of borax, and in remunerating quantities. There was some talk that work would soon be commenced at the large lake, but nothing definite has as yet transpired in regard to it.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Travelling Agents.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warerooms and inspect our stock.

GEO. E. PHELAN.

W. H. J. BROOKS,

Searcher of Records, and Examiner of
Titles,

IN ALL THE COUNTIES OF CALIFORNIA.

Abstract of Titles, examined and reported on.

HAVING DEVOTED HIS ATTENTION TO THIS BUSINESS exclusively during the past twelve years, he is familiar with the land and Conveyancing Laws of California, the Spanish, Mexican and American Records, and the Titles to Real Estate in San Francisco and all the Counties of California.

Persons contemplating the purchase of Real Estate in any portion of California can have the Titles thereto examined and reported on with accuracy and dispatch on reasonable terms.

Office, 316 California Street

MILLER & HALEY'S MILLS,

BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers.

MILLER & HALEY.

I. O. O. F.

THE NEW AGE,

A WEEKLY JOURNAL OF SIXTEEN PAGES.

The "Official Organ" of the I. O. O. F. on the Pacific Coast.

Is devoted to Odd Fellowship, the Arts and Sciences and GENERAL LITERATURE; and as a family paper is not surpassed by any journal in the United States. Subscription price per year by mail, \$5. Delivered in the city, per month, 60 cents. Office, Odd Fellows' Hall, 327 Montgomery street, San Francisco.

19v19

WIESTER & CO.,

PATENT BROKERS,

No. 314 Bush Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Improved Construction of Roofs for Tobacco and Fruit Drying Houses.

Persons who are interested in the drying of fruit or tobacco, can fully appreciate this new and useful invention. The object of the invention is to construct the two inclined sides of the roof of a Tobacco or fruit-drying house, so that the sides can be easily and quickly thrown into a vertical position, so as to expose the fruit or tobacco to the drying effects of the sun and air. By the use of this simple device, the labor and expense of hauling the tobacco leaves, and changing them upon the racks, is avoided. In California and Oregon, this invention can be used to great advantage in fruit drying. In time of rain the sides of this roof can be almost instantly lowered to protect the fruit from dampness. This invention has been recently patented by M. de K. Cutts, of Richmond, Va., and a full set of drawings, and Letters Patent, can be seen at our office. Here is an opportunity for a profitable investment, as we are authorized to dispose of Rights at very low prices. Full particulars can be obtained from any of our travelling agents, or by calling at our office.

NEW HOSE COUPLING.

This coupling is one of the most useful and perfect inventions of the day. It can be joined almost instantaneously and answers equally well for gas or water hose. Call and examine samples. The Right, to any town or city on the coast, will be sold at a reasonable price.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Oils. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Hunter's Improved Grain Separator.

The best machine to Clean Grain in the world. Prices reduced. Send for descriptive circular and price list. County Rights for sale.

For Sale.

We have for sale the right to the Pacific Coast for the safest, cheapest, most compact and simple Engine and Hoisting Machinery for mining and other purposes ever invented. Although new it has been thoroughly tested and we have strong testimonials in its favor from many of the most substantial men of the East.

We invite manufacturers and others, to call at our office and make their own investigations.

WIESTER & CO.,

JUST THE WORK NEEDED.

Published July 20th, 1870.

ROASTING OF GOLD AND SILVER ORES,

EXTRACTION OF THEIR RESPECTIVE METALS WITHOUT QUICKSILVER.

By G. KUSTEL, Engineer and Metallurgist; author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of All kinds of Ores." 145 pages, 12mo.

Illustrated by Numerous Engravings.

Published and sold by DEWEY & CO., SCIENTIFIC PRESS OFFICE, 414 Clay street, San Francisco. Price, \$2.50 coin, or \$3 currency. Postage, free.

AGENTS WANTED.

JUST OUT.

BANCROFT'S NEW MAP

OF THE

PACIFIC STATES

California, Oregon, Washington, Idaho, Montana, Nevada, Utah, Arizona, British Columbia and Alaska.

Elegantly engraved on copper and colored in counties. Fifth edition, thoroughly revised and brought down to date 1870. It shows the great Overland Railroad, also the proposed Northern and Southern Pacific Railroads and their connections; also all Railroads completed and projected in California and Oregon.

Upon the same sheet, on a less scale are the maps of Alaska, and a complete Railroad map of the United States.

No other map can compare with this edition in fullness of detail, and beauty and accuracy of its topography.

An enterprise of such magnitude and importance as this large and elegant copper-plate map, in order to be properly appreciated, should be in every office, school-house and dwelling. Those wishing an agency should apply immediately for terms, to

AGENTS WANTED

FOR

Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever published. It is not only a

COMPLETE ENCYCLOPEDIA,

Freshly written, and up with the times, but is also a thorough and complete

Lexicon, a Gazetteer of the World, a Biographical, Biblical, Legal and Medical Dictionary.

And the only book ever published containing all these subjects, with 2,000 Engravings. This really wonderful work is to render readily accessible reliable information on every conceivable subject. No human being could be found to whom it would not prove invaluable. It minutely describes every disease flesh is heir to; explains every legal term or phrase; gives the geography of the entire world; acquaints you with all noted men and women living or dead; describes every country, city and town; defines every word in use in the English language; pictures the birth-place and gives portraits of many distinguished persons; teaches the correct pronunciation of proper names; is a biographical dictionary of all nations; a biblical dictionary; describes every animal known to exist; acquaints you with authors, sculptors, travellers, warriors, painters, divines, historians, naturalists, etc., of ancient and modern times; speaks of all the battles and heroes of the late war; and explores the whole vast vegetable kingdom.

AGENTS WANTED.—Apply to DEWEY & CO., 542 California Street, San Francisco, General Agents for the Pacific States, and Territories.

A Valuable Improvement

Combination Locks,

And Fastenings for Vaults and Safe doors. Invented
and Patented by Kirtledge & Leavitt of this city. The
improvement of which consists in the applying of a
"Detachable Knob" or Wrench to the Arhurs or Cylin-
ders, passing through the door, so as to operate the
Lock and Fastenings on the inside—leaving the outer
end sunk or even with the surface of the door. It is
made of hardened steel so as to resist the operations of
the Burglar, rendering the Lock perfectly secure and
safe.

All parties are hereby cautioned not to infringe on
this patent, as the owners will protect their rights to
the full extent of the law. None genuine unless marked
K & L's Patent. Manufactured and sold by

KITTLEDGE & LEAVITT, Patentees,

A REBELLIOUS STOMACH.—The stomach like the body
politic, resents ill treatment by rebellion. And when
it rebels, the liver, the bowels, the nerves, the circula-
tion, the brain, revolt likewise, and the whole system
is disconcerted, agitated, and the whole system
deranged organ first, and the disturbance in its depend-
encies will speedily cease. The tonic, alterative, cor-
rective and purifying properties of TARRANT'S EFFER-
VESCENT SELTZER APERIENT, render it an irresistible
remedy in cases of indigestion and its concomitant ail-
ments. It is a mild and genial, and its cathartic op-
eration is so mild and genial, that it never produces the
slightest symptoms of debility.

[CONTINUED FROM PAGE 362.]

this zone. And in this zone exist and have existed far back into the earlier ages the highest types of human civilization, of intellectual and moral energy; as if these deposits were purposely placed in the earth and hidden until the proper times, for the use of the highest races of mankind.

Origin of Coal.

The belief in the vegetable origin is now general. Some of the reasons for this belief are as follows: With every coal seam we find abundance of impressions of vegetable remains; we find leaves, trunks and roots of trees, often in position. These trunks have both the external appearance and the internal structure of trees and are yet perfect coal. The objections to the supposition that they have been changed, as in petrifications, by replacement of the original substance by bituminous matter, molecule by molecule, are that such petrifying substances are soluble, but bitumen is insoluble; and the material in which the logs are imbedded, the petrifying material, is found on close examination to have itself a vegetable structure. Between wood and coal we can trace every stage of gradation; from trees to the slightly blackened logs in peat bogs and mud, to black logs which are soft and can be cut like cheese, to brown coal which still retains the structure of wood, and so on to the hardest coal and even to graphite. The chemical composition can also be traced back in full series. We can also trace, it may be added, a peat series, to a certain extent, when it coalesces with the wood series.

Varieties of Coal.

There are many varieties of coal. One class is distinguished by the relative amounts of combustible or organic and the incombustible or mineral matter, the last giving the ash. We have every shade of coal, with from $\frac{1}{2}$ to 1 per cent. of ash, up to 10, 20, 30 or 40 per cent. With a larger per cent. than the last, we call it shaly or slaty coal; with over 50 per cent. we call it coaly shale, and so we can trace this series up to pure clay. As all vegetable matter contains some mineral substance, and as, in the change to coal, it loses a certain amount of the organic matter while keeping all the inorganic, we can call coal with not over 5 per cent of ash absolutely pure; that is, it holds no inorganic matter but what was in the vegetable substance from which it was formed.

Some varieties are founded on the more or less perfect bituminization of the coal.

Varieties are very usually founded on the relative amounts of bitumen and of carbon, which compose the combustible parts of coal. Here we find every variety. We can easily separate these two substances, as by retorting in closed vessels. The volatile bitumen is driven off and caught as gas and as coal tars; the carbon is left as coke.

The total absence of bitumen gives graphite. With 80 to 60 per cent of carbon, we have anthracite, valuable for iron smelting (with hot blast) etc. With 70 to 80 per cent, we have semi-anthracite or bituminous coal, which burns with a bright flame and without coking, gives a rapid, hot fire and is especially adapted for generating steam. With 60 to 70 per cent, we have caking coal, which cakes but doesn't fuse or run, on burning, and which is our ordinary bituminous coal. With 50 to 60 per cent., we have the fat or fusing coal, which fuses and runs; this variety is not adapted for iron smelting unless previously coked.

Again, we have varieties depending on the chemical change of the material in passing from wood to coal, and on the chemical change effected after the coal is formed. A few examples will illustrate the first of these points. We may take the general formula for wood as $C_3H_5O_2$; bitumen, $C_{24}H_{16}O_2$; cannel coal, $C_2H_5O_1$; anthracite, C + a little H and O ; graphite, C alone. The only difference then is in the gradual loss of carbon and hydrogen.

Chemical Changes.

Now we can trace these changes in the decay or decomposition of wood. But here there is an important difference whether the wood decays in contact with air, (called sub-aerial decay) or where no air can get to it, as under water or mud (sub-aqueous decay). In the first case, one part of carbon unites with two parts of oxygen and goes off as carbonic acid, CO_2 ; while two parts of hydrogen (for every single part of carbon) unite with oxygen from the air and also go off. Now, according to this, taking the formula of wood as before ($C_3H_5O_2$) the first step of decay, losing one part of carbon, two of hydrogen and two of oxygen, gives us $C_2H_3O_2$; the next, $C_2H_3O_1$; and so on until we finally have only carbon left. We might think then that this would give us anthracite and graphite, but we must remember that sub-aerial decay always produces a material which crumbles and disintegrates. In every coal basin we find streaks of a black crumbling substance resembling black chalk and called mineral charcoal, which we can think formed in this way, but not so the coal with brilliant resinous fracture.

This last we must consider formed by sub-aqueous decay, where the elements must combine with one another, no air being present, and which we will now consider. We know that in such decay, carbonic acid (CO_2) carburetted hydrogen (CH_4), and olefiant gas (C_2H_4) are formed. If we stir up the water of a pool, at the bottom of which lies decaying vegetable matter, bubbles arise which hold CO_2 and CH_4 . In every coal mine choke damp (CO_2) fire damp (CH_4), and some olefiant gas are forming.

Now by taking different amounts of these combinations from wood, the chemical formulae resulting will show us how every variety of coal can be formed. Thus, from wood ($C_3H_5O_2$) takes 9 parts of CO_2 , 3 of CH_4 and 3 of water (H_2O), that is, take $9CO_2 + 3CH_4 + 3H_2O = C_{12}H_9O_{11}$, and we have left $C_2H_3O_1$ or the formula of cannel coal. Taking away $11CO_2 + 11CH_4 = C_{24}H_{16}O_2$, we have $C_{12}H_9O_{11}$ or pure carbon or graphite. Taking $10CO_2 + 3C_2H_4 = C_{16}H_5O_{10}$ we have $C_2H_3O_2$ or bitumen.

Effect of Heat.

Many believe that all true normal coal is bituminous, and that it is heat below in the earth which divides off anthracite and graphite. If we drive off the bitumen rapidly we get porous coke, but if the action is performed very slowly the coal becomes dense and compact. We may, perhaps, speak of anthracite as metamorphic coke, as we speak of metamorphic rock. Indeed, we find an invariable connection between anthracite (or graphite) and metamorphic rocks. Thus, in the oldest rocks which have undergone the greatest change we find only graphite. Coming back in the paleozoic era, we find the same connection between the changed rocks and the changed coal. In the carboniferous age, with both anthracite and bituminous coal, we find the former always with the more metamorphosed rocks. And so on. Thus in the tertiary even, we find anthracite, but the condition of the rock always explains it. The anthracite in Colorado and New Mexico is due to the great lava flows. And whenever a dike of eruption rock breaks through a coal field, the coal is always changed, only as we have here a greater or less exposure to air and rapidity of change, we get not so much anthracite as coke.

The lecturer spoke somewhat longer on this subject and announced that in his next lecture he would treat of the coal plants.

ROASTING OF GOLD AND SILVER ORES and the extraction of their respective metals without quicksilver; by G. Kustel, mining engineer and metallurgist. Contains 142 pages embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit by an author whose reputation is unsurpassed in his speciality. Price \$2.50 coin or \$3 currency. Published and sold by Dewey & Co., Scientific Press Office, San Francisco, 1870.

THE CONCENTRATION OF ORES (of all kinds,) including the Chlorination Process for gold-bearing sulphurets, arsenurets, and gold and silver ores generally, by Guido Kustel, with 120 lithographic diagrams. Published and sold by Dewey & Co., Scientific Press, San Francisco, 1868. Price, postage paid, \$7.50, in gold or its equivalent. The best treatise published.

NEVADA AND CALIFORNIA PROCESSES of silver and gold extraction; for general use, and especially for the mining public of California and Nevada, by Guido Kustel, containing 350 quarto pages, and illustrated with accurate lithographic engravings, 1868. Sold by Dewey & Co., Publishers Scientific Press, San Francisco. Price \$5 (coin).

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, OR ENAMELED CARDS, of the very best quality, you must go to THE NEW YORK GALLERY, Nos. 23 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. J. V. 13. 6m B. F. HOWLAND.

BOILER FELTING saves twenty-five per cent. of fuel. BERRY & PLACE'S MACHINERY DEPOT, No. 114 California street. 1y21-3m

BLOTTING TIN AND SOLDER WIRE, bloom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 7y419-3m

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 1y420

HAVING had numerous applications to purchase the right to manufacture CHAMPAGNE MEAD (the great temperance drink), we will state that we are now prepared to sell State and County Rights on reasonable terms.

KENTON, GASS & CO. 2y21-3m

A FINE THING FOR THE TEETH.—The fragrant Sogonant has taken a very prominent place among the most approved dentifrices of the day. It is a very popular article for the toilet, highly recommended by all who have used it as a beautifier and preserver of the teeth, refreshing the mouth, sweetening the breath, and arresting the progress of decay.

"SPALLING'S GLUE," stickiest thing out.

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co. Don't stop my paper. Your journal is very valuable. No better investment for \$4. Respt. B. C. B.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

CO-OPERATIVE UNION STORE.—This is becoming one of the most useful institutions in the city, and the Mechanic and Laboring Man fully appreciate it. They are now enabled to buy their Groceries and Provisions 20 per cent. cheaper than ever before, and the very best articles in the market. The store is located at 115 Sutter street, Lick House Block.

MARAVILLA COCOA. For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supersedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopaths Cocoa and Soluble Chocolate. Steam Mills Brick Lane, London. 5y20-1y

TO PACIFIC COAST INVENTORS.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, or but ordinary skill required to obtain a patent; but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit honest patronage.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving at least several weeks time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this Coast several months sooner than can generally be done, through agents in the East,—without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is \$25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every event.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 yrs and 6 mos.....	10
On every application for a design, for seven years.....	15
On every application for a design, for fourteen years.....	20
On issuing each original patent.....	20
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, D. C.....	25

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others, should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents.

Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Advancing Cases.

If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be persistently argued before the Examiner, and if possible the decision reversed.

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office, San Francisco.

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a brief description and statement of the productions of each county, besides the usual mining, agricultural and scientific intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer on this coast.—Nov. 26, 1870.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANTISELL.—The Manufacture of Photogenic or Hydro-Carbon Oils, from Coal and other Bituminous Substances, capable of supplying Burning Fluids. By Thomas Antisell, M. D. 1 vol. 8vo. 2 50

AARON (CHAS. H.)—Treatment of Rebellious Liver Ores. 8 pp.; pamphlet. S. F., 1859. Postage free. 25

BROWN (H. T.)—507 Mechanical Movements. Dewey & Co's Scientific Press Edition, S. F., 1870. The most complete publication of illustrated mechanical powers with explicit descriptions. 131 pp. Cloth bound; postage free. 1 00

BARSTOW—Sulphurets; What they are, How Concentrated, How Assayed, and How Worked; With a Chapter on the Blow-pipe Assay of Minerals. 1 vol. 12mo. cloth. 1 00

BLAKE, W. P.—Annotated Catalogue of California Minerals. 8vo. 60

BLAKE, (W. P.)—Report on the Precious Metals at the Paris Ex., 1859. (To be had through Members of Congress.) 3 00

WHITNEY.—A Geological Survey of California. Report of Field Work from 1860 to 1864. By J. D. Whitney. Per. vol. quarto. 6 00

YALE'S Mining Claims and Water Rights. 8vo. 7 50

Any of the above Books will be furnished by return mail or express, on receipt of price, in coin, postage added. Any other books desired will also be furnished at the lowest San Francisco retail prices.

Address, DEWEY & CO., Scientific Press Office, San Francisco.

SCIENTIFIC PRESS, FROM SAN FRANCISCO This Mining, Farming and Mechanic Arts Journal, after a most singular absence from our table, has again made its appearance and is heartily welcomed. It is the recognized mining organ of the Pacific coast, and rightly so, since it is conducted ably and honestly in all respects. It scorns humbug and avoids all merely speculative commendations of sudden discoveries in the treatment of ores. The reliability of the Press in all matters pertaining to mines and mining news, makes it a most desirable paper for our people here. Per annum, \$4.—Colorado Herald, July 6th.

THE SCIENTIFIC PRESS.—This valuable journal is issued in San Francisco by Messrs. Dewey & Co., United States and foreign patent agents for the Pacific coast. It is devoted to mining, farming, the mechanic arts, and industrial progress generally.

It contains sixteen large folio pages, is ably edited, and has descriptions and diagrams of all the most important discoveries, inventions and developments in the various branches of science, mechanics and industrial pursuits.

The Press altogether is a live paper, and each number generally furnishes enough profitable hints to the reader to make it worth more than many times its annual subscription price.

We are pleased to see that the Press is now devoting a portion of its columns to the interests of agriculture, to whom, and miners and scientific men generally, we heartily recommend it. The subscription price is \$1 per annum.—(Missoula "Pioneer," Montana.)

The Scientific Press.

[ESTABLISHED 1860.]

A large Illustrated, Practical Scientific Pacific States Journal, devoted to

Mining, Farming, Mechanic Arts, And Industrial Progress.

Now in its 21st volume, it is printed on superior paper, containing sixteen pages, equal in size to the first-class journals of the Atlantic States and Europe; giving more valuable reading matter than any other weekly journal west of the Rocky Mountains. It is the best printed and only finely-illustrated paper on the Coast.

It is ably edited, and contains, in concise and desirable form, all the most important discoveries, inventions, improvements and developments in the various branches of Science, Mechanic Arts and Industrial Pursuits, interesting to all intelligent readers on this coast. We make a live paper for the times, using plain, comprehensive language, giving information which cannot be had from books, or so readily and cheaply obtained from any other source. Each number often furnishes profitable hints to the reader worth many times its annual subscription price. Please examine sample copies and subscribe at once, and you will not regret it.

Terms, for six months, \$2.50; one year, \$4—payable in advance. Sample copies post paid 10 cts. Illustrated PATENT circulars sent free on receipt of postage stamp.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street, San Francisco.

Patents Obtained Promptly
Caveats Filed Expeditiously
Patent Reissues Taken Out
Patents Secured in Foreign Lands
Assignments Made and Recorded in Legal Form
Copies of Patents and Assignments Procured
Examinations of Patents made here and at Washington
Examinations made of Assignments Recorded in Washington
Examinations Ordered and Reported by TELEGRAPH
Rejected Cases taken up and Patents Obtained
Interferences Prosecuted
Opinions Rendered regarding the Validity of Patents and Assignments
Every Legitimate Branch of Patent Agency Business promptly and thoroughly conducted.

Office No. 2, Express Building, San Francisco, Cal. Nov. 5

Nevada Land and Mining Company.—Location of Works: Steptoe, Johnson & Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of November, 1870, an assessment of four (4) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, Room 5, 202 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the seventeenth day of December, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the seventh day of January, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

W. H. WATSON, Secretary.
Office, Room 5, No. 302 Montgomery street, San Francisco, California. nov14

Silver Sprout Mining Company.—Location of Works and Mines, Kearsage District, Inyo County California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty ninth day of Aug. 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. of Certif.	No. Shares.	Amount.
Brown, B. L.....	11	10	2 50
Cleveland, R. H.....	24	10	2 50
Devlin, J. D.....	12	10	2 50
Davis, James H.....	20	40	10 00
Hearst, Geo.....	(unissued)	200	50 00
McLaughlin, J. W. (unissued)		1000	250 00
Mott, E. B. Jr.....	29	200	50 00
Stowell, Chas R.....	22	1000	250 00
Spaulding, Geo.....	25	40	10 00
Wade, Wm N.....	(unissued)	220	55 00

And in accordance with law and an order of the Board of Trustees, made on the twenty ninth day of Aug. 1870, so many shares of each parcel of stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery St., San Francisco, on the first day of December 1870, at the hour of 11 o'clock A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.
Office, 206, Front street, San Francisco, California. Advertising charges \$2.00 each certificate. Oct. 20-27

Providence Gold and Silver Mining Company.—Nevada County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of November 1870, an assessment of one dollar per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 21st day of December 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday the 6th day of Jan. 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

J. M. BUFFINGTON, Secretary.
Office, No. 37 New Merchants Exchange, San Francisco California. nov19,

Land Purchasers' Association—Office, No. 304 Montgomery street San Francisco.

Notice.—There are delinquent, upon the shares of the following named persons on account of Assessment levied on the first day of October, 1870, the several amounts set against the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Install.	Amount.
Thomas R. Mayes.....	1,2,3,4,5	5	\$250 00
James E. Boyce.....	9	6	30 00
J. W. Cherry.....	10	6	30 00
John Bay.....	28	8	80 00
Thomas H. Day.....	32,33	2	40 00

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore." Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency, postage paid.

KUSTEL'S NEW BOOK.—We have received from the publishers, Dewey & Co., a copy of Kustel's work Roasting of Gold and Silver Ores. It abounds in valuable information upon the subjects which it treats, and no person engaged in mining should be without it. Mr. Kustel's writings are based upon actual accomplishments with the ores of the Pacific slope, are not mere theoretical propositions. Sold at the SCIENTIFIC PRESS office S. F. Price \$2.50 coin, post paid.—Marysville Appeal.

San Francisco Metal Market.

and

Steamships.

REQUIRES

Fifty Per Cent.

LESS POWER

Than any Blower

Now in use.

One of these Blowers may be seen on exhibition at W. T. Garratt's Brass Foundry, corner of
Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's
Foundry, Gold Hill, Nevada; Anna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as
certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior
construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low
Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Pat-
entees, WILSON & SWIFT,
of Hudson, Michigan,
their right to this mill,
Patented June 22d, 1869,
for California, Oregon,
Washington Territory,
Montana, Utah, New
Mexico and Arizona, wish
to call the attention of
FARMERS, MILLERS AND
GRAIN DEALERS to one of
THE GREATEST IM-
PROVEMENTS OF THE
AGE for cleaning and sepa-
rating grain. While it
combines all the essential
qualities of a first-class
FANNING MILL, it also far
exceeds anything that has
ever been invented for the
separation of grain. It
has been thoroughly
tested on all the differ-
ent kinds of mixed grain,
separating all the differ-
ent seeds in almost a mag-
ical manner, placing them
in their different compart-
ments in the mill arranged
for their reception, at the
same time taking out all
the Mustard, Grass Seed,
Barley and Oats, and mak-
ing two distinct quali-
ties of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the
small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this
Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the
farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was
exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and
bore away the palm over some thirty other different mills from all parts of the United States, including the fa-
mous DICKY Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, de-
clare its perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced
on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the
State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2
Mill, 15 tons; No. 3, 10 tons. A large number of recommendations and certificates of the practical working
of the mill will be furnished. Circulars containing references sent free by mail N. B. Town, County, or State
Rights for sale on favorable terms. For further particulars apply to
N. B. STONE, 423 Battery Street, San Francisco.

THE WILSON
Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326
Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
209 1/2-tf Supt. W. P. S. S. M. Co., Philadelphia.

THE ASPHALTUM PRESSURE PIPE COMPANY,

HAVING ERECTED A MANUFACTORY
of sufficient capacity to supply their Asphaltum Pipe in
large quantities,

Are now Prepared to Take Orders
AND MAKE CONTRACTS,

This Company will manufacture Pipe and guarantee
it to stand any pressure required; it is lighter than iron
pipe, and more durable, it is not affected by chemical
action, cannot corrode, and being glazed imparts no dis-
agreeable taste to water. To miners and farmers it is
invaluable; any body can put it down; it is twenty per
cent cheaper than iron pipe and ten times more durable.
For further particulars, apply at the office of the Com-
pany, Room No. 2, 645 Market street.
Circulars sent on application. 16v21-tf

Concentration of Ores

(OF ALL KINDS,) INCLUDING THE

CHLORINATION PROCESS

FOR GOLD-DRAINING SULPHURETS, ARSENURETS,
AND GOLD AND SILVER ORES GENERALLY.

By GUIDO KUSTEL,

MINING ENGINEER AND METALURGIST,

Author of "Nevada and California Process of Silver
and Gold Extraction."

With 120 Lithographic Diagrams.

Published and sold by DEWEY & CO., Publishers
SCIENTIFIC PRESS, San Francisco, 1868.

Heads of Table of Contents.

- I. INTRODUCTION.—The Dressing; The Separation;
Cleansing and sizing Contrivances; Rotary Sizers, etc.
- II. REDUCTION.—Reduction of Ores; Description of
Batteries; Details of a Battery; Speed, Curve and Or-
der of Lifts; The Discharge of Batteries; The Feeding
of Batteries; Reduction by Rolling Mills; Grinding;
Pans with Plane Mullers; Pans with Conical Mullers;
Pans with Fractory-Conical Mullers; Pans with Per-
pendicular Mullers.
- III. CONCENTRATION.—Concentration of Reduced
Ore; A Concentration of Ore Grains, (Jigging Stuff);
Movable Jiggers; Stationary Jiggers; Centrifugal Jig-
gers; Rotary Machines; Concentration of Ore Sands;
Assorting of Sands; Feeding of Concentrator; Station-
ary Concentrators; Percussion Table; Oscillating and
Shaking Tables; Steady Moving Concentrators.
- IV. SPECIAL CONCENTRATION.—Concentration of
Gold Ores; Concentration of silver Ores; Concentra-
tion of Lead and other Ores.
- V. CHLORINATION.—Extraction of Gold from Sulphu-
rets by chlorination; Assay ditto; Loss of Gold in
Roasting; Roasting Furnaces and Operation; Roasting
with Salt; Dampening of Roasted ores; Sifting; Pro-
duction of Chlorine Gas, Lixivation; Precipitating
Vat; Precipitation; cost of Process; Remarks; Other
methods of Dissolving and Precipitating the Gold
from Sulphurets, etc.

This work is unequalled by any other published, em-
bracing the subjects treated. Its authority is highly es-
teemed and regarded by its readers. Containing as it
does, much essential information to the Miner, Mill-
man, Metallurgist, and other professional workers in
ores and minerals, which cannot be found elsewhere in
print. It also abounds throughout with facts and in-
structions rendered valuable by being clearly rendered
together and in simple order.

Price, postage paid, \$7.50, in gold or its equivalent.

MINING PUBLIC OF CALIFORNIA AND NEVADA,

With full explanations and directions for all metallurgi-
cal operations connected with silver and gold from
a preliminary examination of the ore to the
final casting of the ingot. Also, a descrip-
tion of the general metallurgy of
silver ores.

By GUIDO KUSTEL,

Mining Engineer and Metallurgist, former manager of
the Ophir Works, etc.

Containing 350 quarto pages, and illustrated with
accurate Lithographic Engravings. 1363, Sold
by DEWEY & CO., Publishers SCIENTIFIC
Press, San Francisco.

As its title indicates, this work gives a wide range of
information, applicable to all vein miners and workers
in precious metals, affording hints and assistance of ex-
ceeding value to both the moderately informed and the
most expert operator. One in hand it is held for trust-
worthy reference by the owner and highly recommended to
others who do not possess it.

Price \$5 (coin) bound in cloth, \$6 bound in leather.
Address DEWEY & CO., SCIENTIFIC PRESS OFFICE, San
Francisco.

THE MASONIC MIRROR

Is the only Masonic Publication on the Pacific Coast.
The Second Volume is published weekly, in the popular
and beautiful form of a

QUARTO-MEDIUM SIXTEEN PAGE PAPER

AND IS A FIRST CLASS

Literary and Family Newspaper,

AS WELL AS THE

Organ of the Masonic Fraternity on the
Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by
the M. W. Grand Lodge, F. A. M., of the State of
California, at its Annual Communication, October, 1870.
Whereas, in the opinion of this Grand Lodge, a well
conducted Masonic Journal is of great benefit to the
craft, in disseminating Masonic information among the
fraternity, as well as furnishing a medium for general
Masonic intelligence. Therefore,

Resolved, That this Grand Lodge, recognizing in the
Masonic Mirror, edited by Brothers Amasa W. Bishop
and Edwin A. Sherman, and published by the Masonic
Publishing Company of San Francisco, a Masonic Journal
of the character above set forth, do hereby recom-
mend the said Masonic Mirror to the craft generally, as
worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. Grand Consis-
tory, Ancient and Accepted Scottish Rite of Freemason-
ry in and for the State of California, held October, 1870
at San Francisco, the following resolution was unani-
mously adopted: Resolved, That the Masonic Mirror,
published in this city be the official organ of this Grand
Consistory.

TO ADVERTISERS.

The Mirror presents the best Advertising medium on
the Pacific Coast, as it circulates in every town and
hamlet, and among a class of citizens that it will be of
advantage to advertisers to reach.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they
have no equal. No effort has been, or will be spared,
to have them constructed in the most perfect manner,
and of the great number now in operation, not one has
ever required repairs. The constant and increasing de-
mand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly
into the pulp, or with steam bottoms, as desired.
This Amalgamator Operates as Follows.
The pan being filled, the motion of the muller forces
the pulp to the center, where it is drawn down through
the aperture and between the grinding surfaces.—
Thence it is thrown to the periphery into the quicksilver.
The curved plates again draw it to the center, where it
passes down, and to the circumference as before. Thus
it is constantly passing a regular flow between the grind-
ing surfaces and into the quicksilver, until the ore is
reduced to an impalpable powder, and the metal amal-
gamated.

Suits made on the same principle excel all others.
They bring the pulp so constantly and perfectly in con-
tact with quicksilver, that the particles are rapidly and
completely absorbed.

Mill-men are invited to examine these pans and settlers
for themselves, at the office, 229 Fremont Street,
San Francisco.

STEAM JET PUMP.

Blakelock & Williams' Patent, for
Water, Oils, Acids, Etc.

The best cold water
pump for filling tanks for
stationary or portable
Steam Engines. Also high-
ly recommended for
MINES, DISTILLERIES,
SALT WORKS, STONE
QUARRIES, and similar
places, and saving the ex-
pense of putting up and
running an engine.

We ask the attention of
all proprietors of steam
power to the following
points of merit:—It is
operated by steam taken
directly from the Boiler
into the Pump; it has no
valve or wearing parts of
any kind; it requires no
belts, pulleys, or machin-
ery of any kind; it oper-
ates entirely independent of an engine; it will not choke
up with foul water; it
start; it will not wear out in a lifetime, or require re-
pairs; it is reliable, and certain to work at all times; it
is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded.

Thursday Evening.

Owing to the time necessary to mail the present large
edition of the SCIENTIFIC PRESS, we are obliged to go to
press on Thursday evening—which is the very latest
hour we can receive advertisements.

FOR SALE.—An account due this office for advertising
for A. Jackson, of La Crosse, Wis., will discount 99 per
cent. if necessary, 19v21 1y.

THE SCIENTIFIC PRESS has the largest circulation of any weekly journal published West of the Rocky Mountains, independent of a daily issue. Its readers are prominent among the most intelligent, industrious and thrifty classes throughout the Pacific States and Territories.

A NEW PAPER FOR 1871.

PACIFIC RURAL PRESS.

A First Class Pacific States Agricultural and Home Journal.

Will be issued weekly on Saturdays, commencing Jan. 7th, 1871, containing sixteen pages devoted to

Agriculture, Horticulture, Stock Raising, Domestic Economy, Home Manufactures, Mechanics, Industries, etc.

With an able and ample corps of editors, special contributors and correspondents. We shall publish a liberal variety of articles, entertaining as well as instructive, which will not only make the RURAL PRESS an able assistant to its patrons, but an attractive and welcome visitor to every reader in every intelligent

Home Circle,

in the Pacific States. And more than this, we shall freight its columns with fresh thoughts, and new ideas, which hastened across the continent by rail, shall awaken and quicken the zeal of the more staid and gradual moving culturists of the eastern and European States, to their

Pleasure and Profit.

We shall not only make a good paper for all husbandmen and homestead owners, (who now, more than ever require a knowledge of new discoveries in science and mechanical improvements,) but shall also render the journal a desideratum for those who contemplate becoming freeholders, and a large class of

Mechanics, Teachers, Students, Business, Professional and Trades men,

whose interests are more or less identical with successful farming, and the active development of our vast and rich resources. Few there are—male or female—who will not find pleasure and ennoblement in the study of progressive farming and gardening.

Honest, intelligent and correct information will be faithfully given, in behalf of, and urging

An improved Cultivation of the Soil; A greater Diversity of Products; Better Breeds of Stock; Better Varieties of Fruits; The Culture of New Products; Creation of New Home Industries; Adoption of Improved Implements, etc. Higher and Happier Aims in Life;

Valuable and Timely Hints,

will be given weekly to lessen the labors of the farm, the household and the shop, and add to the health, the wealth and the wisdom of every patron of industry.

How to Farm in the Pacific States.

As the conditions and circumstances of soil and climate and seasons on this coast are so peculiar that many of the approved methods of eastern agriculture are not at all applicable on our side of the Continent,—special attention will be given to considering the need, extent and character of the modifications necessary. This will alone render the paper of great practical value to our home readers and more essential to them than all the distant publications obtainable, without such auxiliary and modifying instructions.

The following are among the specialties upon which the PACIFIC RURAL PRESS will treat:

Silk, Cotton and Sugar Beet Culture; Nurseries, Orchards, Tropical and small Fruits; Steam-plowing, seeding and harvesting for large tracts; Reclamation of swamp and unproductive lands; Hill and mountain farming; Grape growing; Fig, Raisin and Fruit drying; Irrigation; Lessons and Lectures on the chemistry of growing crops and on fertilizing lands; Practical Farming vs. Speculation; Taxation of unimproved lands; Railroads and improved transportation for crops and the better class of immigrants; Farmer's Clubs, lectures and associations; Co-operation in farming, mechanism, manufacturing and other industries; Government lands for settlers whether sold by R. R. operators or the U. S.; Reliable wholesale and retail market reports; Brief notices of Mechanical and Scientific Progress; Instructions for regular and farmer mechanics; Household Reading; Health and domestic receipts; a sprinkling of sprightly reading; Life thoughts; poetry, condensed stories, items of news, etc., will be given.

A Plain and Simple Style

Of writing will be our endeavor. Necessarily dealing largely in researches for facts we believe it desirable to present them in an inviting shape and in so comprehensive language that our special journalism shall advance in popularity and common relish.

No editorials or selections of unchaste or doubtful influence; or lottery, quack or other disreputable advertisements, will be admitted into its columns.

Arrangement of Matter.

Our reports of agricultural, horticultural and other fairs, lectures, farmers' clubs and social literary meetings [the improvement and increase of which we shall especially advocate] will be carefully prepared in a valuable form for preservation; and the matter of our entire columns will be so classified as to be convenient to readers of various minds and individual tastes for ready perusal and future reference.

Interesting Illustrations of Pacific States and Eastern Inventions and Machinery, Fine Arts, Science, Fruits, Rare Stock and Natural Scenery,

Of special or peculiar interest to our readers will be published weekly in liberal variety. No pains or reasonable expense will be spared to furnish a

Large and Richly Filled Journal

Nicely printed on fine paper, which will favorably compare with the long established class journals of more populous fields and older communities. Although the latter have less opportunities than new communities to be benefited by printed information of discoveries,

And Neighborly Experiences,

the reading of agricultural newspapers and books is lately increasing with a rapidity quite astonishing, and with the most profitable results.

We enter the field after a careful consideration and consultation with many of our leading agriculturists, with the strong conviction that such a journal on this coast is greatly needed and earnestly desired by the most prospectively flourishing and rapidly progressing community in the Union if not in the world. We know the task before us,—two of the proprietors and editors having experienced respectively 18 and 13 years of successful journalism in this state.

Five Thousand Subscribers.

We shall print 5,000 copies of the issue of January 7th. That is the number of subscribers we hope to start with, having half that list already.

Subscription in Advance.

One copy one year.....\$4.00
One copy six months.....2.25
One copy three months.....1.25
Single copies.....10

CLUB RATES.

Ten copies or more, first year, each.....\$3.00
[A free copy or premium sent to getter up of club.]

Advertising Rates Favorable

A select variety of advertisements only will be inserted. Circulated widely among the most thrifty of our population, the P. R. P. will be the cheapest and most effective medium for a large range of first class advertisements in the Pacific States.

Parties desiring to get up clubs or act as agents, will be furnished sample copies and prospectus free.

Giant Powder.

Proof of its Superiority for Blasting purposes.

GOLDEN CHARIOT MINING COMPANY, SILVER CITY, IDAHO TERR., Oct. 18, 1870.

Messrs. Bandmann, Nelson & Co., Agents Giant Powder Co., San Francisco, Cal.

DEAR SIR: In reply to your late favor, I give you the following result of my working here—the cost of drifting, which cost under the old system of mining here, \$40 per foot, with the single hand system of working and Giant Powder I have reduced to a cost of \$22 per foot, and when under the old system but one foot per day was given, my men are easily making one and a half feet.

Under the old system wining (5 feet square) cost \$35 per foot, same is now costing me \$24.75 per foot with the same difference in time as shown in drifting.

Under the old system, our mine could never be made to yield exceeding 400 tons per month; with Giant Powder and single hand drilling, I am now furnishing monthly 1,000 tons at a reduced cost of at least 33 1/2 per cent, less per ton than under the old system.

In conclusion, will state that the neighboring mines Ida Elmore and Oro Fino, influenced by results in the Golden Chariot Mine, have adopted single hand drilling and Giant Powder to the utter exclusion of double hand work, large drills and common blasting powder. In corroboration of results in Golden Chariot Mine, I refer you to the President and Board of Trustees, resident in your city. Yours, respectfully,

JOHN F. CASSELS, Superintendent G. C. M. CO.

Mining Edition.

A New Car Wheel.

The need of an improved car wheel is felt everywhere. In this country and in Europe railway men are looking for some device which will answer the demands of the present age. Railroadings have increased so rapidly, demanding larger and heavier cars and a greater speed for transportation of the much heavier burdens, that the wear and tear of the wheel have doubled. The average run of car wheels now may be set down, perhaps, as not over thirty thousand miles, which gives an idea of the great expense of this one part of railroad construction.

This need has called forth the most varied construction, and wheels made of all sorts of materials. Wood has been employed in various ways, with wrought iron flanges and bolts and steel tires. Even paper has been called into requisition, and numerous other constructions, all designed to give greater elasticity and hence greater durability. But these combinations are very costly and, all things considered, there seems nothing, as yet tried, which can equal good chilled iron, and the point now desired is, how to devise a way of preventing the chill from becoming imperfect on the tread.

We are happy to say that at this point California has produced an invention which we think answers the difficult question in an excellent manner. Patents have been granted this year to a Californian for the device which we here illustrate, and which we are disposed to consider of the greatest merit. The main principle of the invention is the interposition of rubber to receive the shocks, give the requisite elasticity, and save valuable material.

The accompanying cuts will give a correct idea of the construction. Fig. 1 shows the general appearance of the wheel, with a part of the covering-plate broken away to show the manner in which it is attached; Fig. 2 is a section through the wheel. A is a solid wheel with a circular opening at its center, in which fits snugly a rubber block, B, surrounding the axle, C. It is provided with circular flanges (one is shown between E and F) and with a series of projections, D, on each side, all these being cast of one piece with the wheel. The inner circular flange is surrounded by a circular ring of rubber, F, and the projections, D, are covered with rubber sleeves or thimbles, of greater length than the projections. In Fig. 2, the rubber parts are shaded with heavy vertical lines, except that part marked B.

On each side of the central part of the wheel there is a covering-plate, J, which is provided with recesses for the corresponding projections, D, of the wheel, and with a groove for the reception of the flange between E and F. D is a ring of rubber, around the central boss of the plate. The dark, diagonally-shaded parts are elastic packing fitted to the inner side of the covering plate.

The rubber and packing are made of such size that considerable power is necessary to force the covering plates on, 100 tons pressure being applied to pack the various parts. After these are put together, they are riveted (merely to hold them in the proper place) while in the press. Then the wheel is ready to be hored out to receive the axle, which is made of such diameter that when in place, all the parts are held together without the need of any bolts or rivets, which, indeed, can be entirely dispensed with.

The wheel is so constructed that 8 lbs of vulcanized rubber are distributed so as to give 350 inches of surface bearing, and to interpose between each of the parts, thus deadening any shock and preventing its passing (to a great extent) from one portion to another, and relieving the journal

These wheels are now used by the Pullman Car Co., the Michigan Central, Boston and Maine, and Boston and Fitchburg R. R. Co.'s, while other roads have sent in orders. Of these, parties have given second orders, showing that they approve of the device, which has been in use over six months. Patents have been secured in this country and Europe by Dr. A. F. Cooper, of San Francisco, who, after successfully introducing it into the East, has now come back to this State to introduce here his invention. The device may be seen at Kimball's Carriage Factory on 4th street.

Academy of Sciences.

Peculiar Fish—Meteors.

At the regular meeting last week a very large number was present. Among the

COOPER'S PATENT AMERICAN ELASTIC CAR WHEEL.

from this frequent source of accidents. This elastic packing is always in direct line with the blows or shocks, receiving them instantly and without danger of slipping. When the wheel strikes a curve, the rubber lets the wheel yield and no shock is transmitted. Those who have tried it, say that where this wheel is used, there is a remarkable increase of ease. In no case thus far has a heated journal-box been known.

The wheel is claimed to be much stronger, safer, more durable and cheaper than any wheel now used. When the tread is injured or worn, it is only necessary to force off one of the covering-plates, take off the outer part of the wheel and replace it with a fresh one, thus saving always one third of the whole wheel. Its importance in saving the journal cannot be dwelt on too much, for this point has been passed over in other constructions. Its durability is more than double that of the ordinary wheel, as one of this construction will last, the inventor claims, a run of over 75,000 miles.

contributions was a specimen and a drawing of a fish which has been regarded heretofore as very rare on this coast, but of which two specimens have been taken here at almost the same time. It is a cartilaginous fish, viviparous, when first caught of a rich brown color in places, and white elsewhere, provided with small leg-like appendages for holding during copulation (apparently), with blow-holes in the head communicating with the abdominal cavity, with a curved horny excrescence on the head, and otherwise peculiar. The back and sides were covered with gold and silver spots, and the head and back lined with black stripes. A fresh specimen preserved in alcohol was also shown. It was pronounced by Dr. Blake a species of *Chimaera*, known in Europe as the Herring-King.

Prof. Davidson gave an account of his observation of meteors on the night of the 13th and 14th. The moon was bright. From 12.30 to 1.45, 3 meteors were seen;

from 1.45 to 2, 3 others; and from 2 to 6, 66 others; all were bright and only 5 were non-conformable. He thought that the earth, at the time of the observation, had either passed through or was possibly on the edge of the meteoric belt. Last year he observed 556 in 3 hours; maximum about 2.30 A. M. One "persistent" meteor left a train after bursting which lasted 8½ minutes, in which time it changed from a straight line to two-thirds of an ellipse, and moved back over two-thirds of its track. The nights were then cloudy.

Fossil Ship—Colorado Desert—Cloud-Bursts.

Mr. Hanks reported on the "Fossil Ship" of the Colorado Desert, reading the various accounts and theories which have been published, and giving as his opinion that very likely the supposed ship was only a mass of the curious travertine which forms often in fantastic shapes in the alkaline lakes on the plains and southern deserts. Prof. Davidson remarked that a surveying party of the 32nd Parallel Railroad made the Desert 750 feet above the sea level, instead of below it. Col. Evans gave a very interesting account of his trips across the desert, during which he had seen the ship, but always at a distance of 3 to 12 miles. The clearness of the atmosphere enabled him to make out quite distinctly an object which certainly bore an extraordinary resemblance to the hull of a vessel, but he could not state with certainty that it was a ship.

Col. Evans and others made some very interesting remarks on the desert formation and the effects of "cloud-bursts." The locality of the ship is a salt plain, covered with a hard salt crust in dry weather, but dangerous as quicksand to the traveler in wet seasons. The Colonel's impression was that the desert might well be above the sea level. The "New River," running up into the desert from the Colorado, might have been formed by a cloud-burst emptying on the desert and cutting a channel which was afterwards closed by drifting sands. These cloud-bursts often make a wonderful difference in the appearance of the country. The fine shells, spirals, denote that ocean-water covered the desert at a very recent date. Graphic descriptions of cloud-bursts were given by Col. Evans and others, and the question of the level of the desert or parts of it was discussed without arriving at any certain conclusions for want of unquestionable data.

At the regular meeting of the Bay District Horticultural Society, last Saturday evening, Prof. Bolander delivered an interesting lecture on the Conifers of the Pacific Coast, which will be continued at the next meeting.

THE WIRE TRAMWAY at White Pine, from the North Aurora and Eherhardt mines to the International mill, will be commenced in a very short time.

GREENBACKS.—Last week, three million dollars, in greenbacks, were brought to this city from the East in one lot.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

All About Montana.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

In closing my series of letters from Montana, I think it will be of interest to the readers of the Press to have a general review of the territory, with facts and statistics gleaned from various publications and from my own experience in the various parts of the country. Some of the places which I have visited, I have already described quite fully, of others I have said but little, and some I have not touched at all, although intending to speak of them. Hence I am led to lump my notes into a general article. [Since the above was set, a delayed letter from Silver Star has been received.—Ens.]

Extending about 750 miles from east to west and 270 from north to south, Montana has an area of 143,776 square miles, or 92,016,640 acres, of which fully a third, according to the Surveyor General, is susceptible of cultivation. Of the remainder much will doubtless be found valuable for the farmer, while for the miner inexhaustible riches are still untouched.

Population—Labor—Climate.

The population was set down as about 40,000 in 1869. In the U. S. census reports published in September of this year, the total number of inhabitants is given as 38,580. This includes 17,995 whites, 179 negroes and of mixed blood, 473 Indians and mixed blood living among the whites, 1,936 Mongolians, and 18,000 Indians living in tribes, under charge of Gen. Sully. Of the 473 Indians living among the whites, only 87 are of unmixed blood, and these people are generally old and poor. The Chinese are beginning to come in in quite large numbers, being attracted principally to the placer mines, but the feeling of the majority here is that they are no help to the country, but rather a curse. The Indians have caused considerable trouble in former days, but strong measures and especially the completion of the Union Pacific Railroad, which brought in its train many other benefits, have made a great change for the better in this respect. No one need now hesitate to come hither on this account.

The price of labor is governed here, as elsewhere, by the law of supply and demand, and of course varies considerably. In the winter wages are much lower than in the summer, when many go into mining, which is impossible, in the placer digging, during the winter. Good carpenters and machinists get from \$6 to \$8 per day. Board is \$4 per day all over the territory for travelers stopping only a short time, and varies from \$12 to \$18 per week, currency.

The climate is naturally exceedingly varied. Often the traveler can see the high mountains covered with snow, while at his feet the cattle are feeding on the grassy plains. In winter it is very cold, but the cold is more endurable than in the moist atmosphere of the States. Yet the lowlands are often almost free from snow during the whole year, and the stock find plenty of nutritious grass in the valleys, during the long winters, on which to grow fat. Wild flowers blossom on the hills in March, and the mountain sides are often green in April. It cannot be denied that in places the winter is severe and the roads almost or quite impassable here and there, when a heavy snow has fallen; yet the mere fact of being so far north proves nothing of itself. Walla Walla on the 46th degree, according to all reports, has a similar temperature to Washington city on the 38th; Clark's Fork of the Columbia, in Montana, on the 48th, the same as St. Joseph, Mo., on the 41st; Bitter Root Valley, Missoula county, on the 46th, the same as Philadelphia, on the 41st, etc. There are also some hot days in August, but as far as I can find, the climate is remarkably equable, pleasant and healthy.

Commerce—Manufactures.

In commerce and manufactures, probably much more is done in Montana than is generally understood outside. The annual commercial transactions amount to \$7,000,000 or \$8,000,000. I know of seven flour mills,—three in Gallatin county, two in Missoula, one in Lewis and Clark, and one in Madison,—costing about \$100,000 to \$120,000, and producing about 250,000 sacks of flour worth, say at \$10 per sack, \$2,500,000; two tanneries, one foundry, 17 saw mills; 15 distilleries, four furniture and a number of plow, wagon, harness and other manufactories. These produce wares annually, worth, in round numbers, two and a half millions of dollars. Very likely others exist, here and there, of which I have no knowledge. Of other productions I will speak hereafter.

From Fort Benton to Lewiston, Idaho, on the Snake river, the distance by way of the Mullen road is given as 525 miles. Over this road trains pass in large numbers every year, although the state of the road is not such as it should be or will be soon. But the Missouri is said to be navigable between the Great Falls and Gallatin City. By this land travel from the Missouri to the Columbia is reduced to less than 300 miles. Let any one take a map and trace the river courses, and the relative position of the territory, the proposed railroads and other improvements, and he will see that the territory is bound to be a commercial center.

W. H. M.

[TO BE CONTINUED.]

Bull Run District, Nevada.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Eds. Press.—I will again send a few lines from our camp. Notwithstanding the cold, the miners are still at work, and ores are still being shipped away for reduction. The Blue Jacket Co. have contracted for the shipment of 25 tons; the Lady Don Co. will ship 10 tons next week; Johnson and Highland Queen Co.'s will ship several tons next week; all of which goes to Vance's mill at Mountain City. Some of the prospectors have already left here and more will soon follow on account of the cold weather, and want of suitable houses to live in through the winter. But about 50 miners will stay to run tunnels and work underground, most all of them having comfortable houses to live in and plenty of provisions for six months. It will thus be seen that things are improving here, as last winter only eight men remained, and if I am not mistaken we will have as large a proportionate increase next winter.

As for the climate here, we must admit it is cold. But the coldest day last winter, it was only 16 deg. below zero, while at the same time in Elko the thermometer stood at 28 deg. below. The snow is deeper here than in Elko, while it is about 80 miles further to the North and about 2,000 feet higher. Yet we are sheltered from all cold winds by the high mountains on all sides.

Our District probably will be shut off from communication for a while, but next spring lively times may be expected. BULL RUN MINER.

Bull Run, Nov. 15 1870.

Notes of Travel in Butte County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Forbestown.

Forbestown is situated about 30 miles from Marysville, and 25 from Oroville. The place is small, but its inhabitants are all alive, which makes up for number.

THE OHIO FLAT MINE, Gaskill & Bowers, proprietors, is situated 2 miles south of Forbestown, in the edge of Yuba county. This claim is a deep channel, washed quartz, gravel and decayed granite. It has been mined for some 14 years past by drifting, and paid handsomely (to other owners); but the disadvantages incurred in keeping out the water, quicksand, etc., and its apparent richness, led the present proprietors to open a cut for drainage, which they did by hydraulic process, with the exception of a very short space which had to be done by blasting. This cut is over a mile long, and averages 30 feet deep the entire length; 3½ years were spent in accomplishing this work; 100 inches of water were consumed daily, and four men constantly employed during that time; this work was finally finished July 1st, this year, after \$24,000 had been expended in running the cut and constructing the flume, which extends the entire length of the cut. In running through the adjoining claim below (which they had to do to get sufficient fall,) they struck bed-rock, 400 feet from their line. In the width of their flume, in running that distance, they took out, and handed over to the owners \$2,500. In 60 days after getting in, they took out two-thirds of their entire expenses for the 3½ years outlay (or \$16,000), and out of a spot not over 150 feet square. They have nearly 3,000 feet ahead of them, and there is no reason why it will not pay even better than that passed over, for it has not been drifted so thoroughly. The gold is quite coarse; several pieces ranging from 3 to 19 ounces were taken out of the part passed over. For some three miles up and down this flat a similar deposit exists.

SOUTH FEATHER WATER CO., Gaskill & Bartholemew. This company own the entire water privileges of this section, extending to Oroville down one range, and to the vicinity of Marysville down another. Their ditch has a carrying capacity of 3,000 inches, and in the driest season they have 1,500 inches of water to dispose of. The ditch waters a larger mining and agricultural section than any other of the same length in the State. It cost its original owners over a quarter of a million dollars. A dividend for this year of \$3,000 was declared August 1st. I should call it a splendid paying property.

TROJAN QUARTZ MILL & MINE. This property, situated 2½ miles west of Forbestown, is owned and superintended by E. W. Slater. The mine is 2,600 feet in length running northeast by south-west, with a ledge from two to six feet thick. There is an incline shaft down on the ledge 120 feet. As far as tested the rock has paid from \$5 to \$8 per ton; it is easily

crushed; for with an 8-stamp mill, 18 to 20 tons are reduced every 24 hours; nine men are constantly employed; the mill is run by a 15-horse power steam engine; and all the modern improvements are brought into use.

Oroville—Oregon City.

Oroville, the county seat of this county, is reached by rail from Marysville; distance, about 24 miles. The bed of the Feather river, which has been successfully mined by fluming for many years, has been abandoned temporarily, and its principal mining now is from the deep channel diggings on its banks extending into the hills. Its citizens are turning their attention more to agriculture, and one gentleman here has invented and patented a new and improved steam plow, a short sketch of which will not be out of place at this time. [The description of the Locher Steam Plow, and the remarks on Mr. Marchella's Turkish Melons are transferred to our agricultural columns.—Ens.]

Oregon City, is situated eight miles north of Oroville. At this point, the CAMBRIAN QUARTZ MILL AND MINE is owned, superintended and successfully worked by E. A. Halstead. This mine is worked through an incline shaft, now down 120 feet. The ledge is from one to four feet thick, and averages about 18 inches; seven men are employed below ground; a 9-inch Cornish pump keeps the mine dry. The mill has five stamps, with shafting complete for five more; at present it is crushing 7½ tons per day (24 hours) which yield about \$18 per ton, besides 4 or 5 per cent. of sulphurets which assay from \$275 to \$600 per ton.

Table Mountain.

This mountain is six or eight miles in length and capped principally by a basaltic or lava rock, lying near the bed-rock on the eastern side and quite thin. On the west side of the mountain the cap-rock is much thicker, and a deep gravel deposit lies between it and the bed-rock. The main Feather river runs at the southern base.

MORRIS RAVINE cuts through the mountain for about two miles, forming North and South mountains, and has cut down below the plane of the deposit on the lower part of the ravine several hundred feet. This ravine is a forty-niner of great richness. Several companies are at work on its sides, mining into either mountain. The principal company is an Eastern one, mining on the extreme head of the ravine, with a clear outlet behind them through Morris ravine into Feather river. Owing to a heavy land slide (which I shall term a land glacier) which has been encroaching upon them, and as yet relying upon the winter rains for water, they have not yet got through the old works and driftings of the last four years that they have been opening. They have spent about \$50,000 in purchasing other mining interests, and in constructing mining conveniences, and they contemplate a still heavier outlay to cover their claims with living water.

CHEROKEE FLAT, BLUE GRAVEL CO., has a tunnel 1,600 feet long, and an incline 750 feet down which has recently reached the deposit of blue gravel and rotten boulders. The company claim 5,000 feet on the lead, and 10,000 feet to the center of Table mountain, and claim to have a lower tunnel for drainage (when complete) than any other in progress, for outlet to this rich and almost inexhaustible lead.

SPRING VALLEY CANAL AND M. CO. are constructing works to bring water to Cherokee, which, if successful, will stir up the engineering world! They have now about 20 miles of ditch which will be extended to Kimeshew Lakes, in 1871, about 18 miles across the west branch of Feather River, at a depression from grade line of 840 feet, on a Howe truss bridge, the iron pipe lying 70 feet from the bottom of the river. The pipe is 30 inches in diameter, and nearly 2½ miles long, laid in a trench about five feet deep. The head is 180 feet above the level of discharge. N. B. Harris is superintendent, and H. B. Lathrop is secretary and agent.

Cherokee Flat

Is picturesquely situated and enjoys a pleasant, healthy climate, being too low for the deep snows of winter and too high for the miasmas of the valleys. The population, of about 500, is engaged almost entirely in mining. Here is undoubtedly one of the most extensive and richest gravel deposits in the State, the development of which has been retarded by the lack of water; being surrounded by deep cañons, it has been considered almost impracticable to get this article to the place.

THE CHEROKEE M. CO., the oldest mining company here, consists of Wm. Gregory, Jenkins Morgan, M. R. C. Pulliam, H. A. Moore, John A. Moore, David Gage, W. L. Howard and the estate of Thos. McDaniel. They have expended for tunnel and flume \$80,000. Their flume is four feet in width with 30-inch sides, and three miles in length, one half of which being through a tunnel. They use rock for rifles with the exception of a few hundred feet at the head of their flume. Having to depend entirely on the rains for water to wash their mines, they have expended \$150,000 in the construction of reservoirs and ditches, have built three miles of embankment (entirely of earth) of an average height of 20 feet, and 60 feet wide at the bottom, for their reservoirs which cover 100 acres. They have about 30 miles of ditches. Those constructed to lead the flood water to their reservoirs are ten feet wide. The deposit in their claim is of three strata; the first, or top, is of light gravel; the second, rotten boulders; the third, or bottom, blue gravel; with pay from

top to bottom. They have as yet only worked the two first. They work the top strata by simply turning the water over the banks, running a few pipes to keep the banks square. The second strata is worked by undermining and caving. During the mining season they employ 50 men. They have recently commenced a tunnel on the west side of the Table mountain, to run entirely through the mountain, which will be 8,000 feet in length, and will enable all of the mines in this vicinity to be worked to the bed-rock, thus opening up the treasures supposed to be deposited under the Table Mountain encased in basalt rock. This company having been long located here, have secured a vast amount of valuable mining ground. Some interesting agricultural statistics in my next from Chico. L. P. MC.

Mechanics' Institute—Cash Premiums for Essays.

The Mechanics' Institute offer the following premiums for essays on the following subjects:

Best General Report on the Manufacturing Interest in California, its present condition and future prospects—Statistics of Manufactures, showing their establishment, progress and present status, Imports, Exports and Consumption. Causes operating against and for it, \$400.

Best Report on the Currents and Tides in the Bay of San Francisco—the effect of building piers, jetties and obstructions therein—the requirements of the harbor and the needs of shipping, and matters of interest in connection therewith, and the water frontage of San Francisco, \$250.

Best Report on the Timber of the Pacific Coast, its adaptability to the industries—embracing its application to ship-building, house-building and general construction, with specifications of localities, distinctive features, durability, transverse strength, value in San Francisco, etc., \$250.

Best Collection of Woods of the Pacific Coast, not less than four examples of each wood—two of these samples to be 12 inches long and 2 inches square, and two to be 12 inches long, 6 inches wide and 1 inch thick—each specimen to be faced on one side, properly classed and labelled with species, transverse strength, specific gravity, green and seasoned, location, dimension of tree the specimen is from, soil, exposure, special characteristics, etc., \$250. Second ditto, \$100.

Above specimens to be the property of the Institute.

Best Collection of all kinds of Stone of the Pacific Coast, with Report on location, accessibility, available for building purposes, pavements, slating flags or ornamental work, limes, cements, etc., \$250.

Specimens to be the property of the Institute.

Best Street Pavement, adapted for heavy traffic and the climate of San Francisco, accompanied by statement of cost, methods of construction, actual tests made, durability, etc., \$150.

Best Report on System of Drainage, adapted to the City of San Francisco, its sanitary requirements and its future wants, \$200.

Best System for Economical transportation of ores, minerals and goods over mountainous places and difficult roads, and its application more particularly to conveying the products of the mines to the mill, \$100.

Best System of Reclaiming Overflowed and Tide lands, \$100.

For the best Essay and Report on the various modes of treating ores of gold and silver, here and elsewhere, showing the best practical results (i. e., the largest percentage of precious metals at the lowest cost), where and how obtained, with a view to pointing out the advantages and defects in the system adopted on this Coast in the management of the mines, above and underground, \$250.

NOTE.—In the above Report it is not the object to advance any new theory, but to confine it to practical processes, modes and results, now in existence. It is also desirable that the methods adopted in the reduction of low-grade rock in Australia be presented.

For the best method of Clearing and Cultivating Tule Lands, \$100.

Best Report on economical process of Preserving Timber and Wood from decay, with sample, \$100.

Best and most successful attempt to raise Ramie Plants, with statement of cultivation, method, etc., \$100.

Best and most successful attempt to raise Beet Root for Sugar, with statement of method of cultivation, and other data in connection therewith, \$100.

Same of Tea, \$100.

Same of Cotton, \$100.

Same of Tobacco, \$100.

Same of Rice, \$100.

Best Design for a Cocoonery adapted to the climate of California, \$50.

Best Collection and largest variety of Metals on the Pacific Coast, \$100.

Best Design for Iron Frame for Roof, \$100.

The above premiums are to be paid either in cash or plate (engraved) of equal value, at the discretion of the successful competitors. The Board of Managers reserve the right to reject any Report, Essay or Exhibit which may be deemed by the Judges to be unworthy.

All communications, reports or essays for premiums shall be considered the property of the Institute, and may be published by them in any way and time they may deem proper; and any papers which have been read in any public manner whatsoever, or published in any form shall not be admitted to competition.

Mechanical Progress.

THE HENDERSON PROCESS OF STEEL MAKING.—The *Iron Age* of November 17th thus describes it: "The new steel process consists in the combined use of fluorspar and titanio acid, applied to cast iron at the melting temperature, preferably in reverberatory furnaces. Fluorine is given off from the fluorspar, and is a more powerful agent for the removal of silicon than oxygen, and removes it almost entirely from the cast iron before the reactions with the carbon begin; the phosphorus and sulphur are next acted upon and removed in the order they are named by means of the combined action of fluorine and titanio acid, or fluorine, titanium and oxygen; and, last, the carbon is removed. The fluorine is derived from fluorspar combined with iron ores containing titanio acid in such wise as to ensure simultaneous action of the fluorine, titanium and oxygen upon the cast iron; and by reason of the affinities of fluorine, titanium and oxygen for silicon, phosphorus, sulphur, manganese, arsenic and carbon, these substances are taken from the iron in the form of vapor or slag, leaving the purified metal in the condition to be hammered or rolled as merchantable steel. English and American pig iron may be made direct into steel by the new process; and with the large class of irons smelted from hematites, specular, and better qualities of magnetic ores, with good fuel, pure steel may be made that will be entirely deacidized, dephosphorized, desulphurized, and contain but the desired amount of carbon to form steel of any particular degree of hardness, by arresting the decarbonization of the metal whilst undergoing conversion."

Details of experiments and analyses following. We quote again: "From the foregoing it will be seen that the refined cast iron of the new process contains but one twenty-fifth of the silicon, and, also less than one-half the sulphur, and about the same amount of phosphorus, as compared with the Hoop L bar iron. This is the most celebrated wrought iron in the world, and is used exclusively for making steel, and sells in Sheffield at £24 per ton. The analysis of the steel of the new process shows, as compared with Sanderson's and Krupp's that while the latter are alloys of carbon, silicon, sulphur, phosphorus, etc., the steel of the new process is practically pure iron and carbon."

NEEDLE AND FISH HOOK FACTORY.—We find in the *Iron Age* an imperfect notice of an establishment in New Haven. The writer says there is some difficulty in gaining permission to visit it. His description, though vague, may serve to give a general idea of the operations, and we give a portion of it:—"The machinery for needle making occupies but little space. First, the wire is uncoiled, passed through the straightener, then cut off the proper length; it next passes through the trimming dies, which make and perfect the point; then goes under three dies which form the eye; the eye is trimmed by trimming mills; the needle now passes along on a revolving disk, and the points are trimmed by another set of mills, after which it drops into a pail and is ready for inspection, tempering and polishing. The writer was not admitted to the polishing room. The needles are stuck upon the papers by another machine. * * * The machines for making fish hooks were of different sizes. The same can be used for a smaller hook, but has to be set over in such a case. The wire first passes from the wheel, through the straightener, is then cut off the proper length; the barb is next made, then the shears cut the point and the mills trim it; the wire now passes under the bender which forms the hook, and being ready for inspection and tempering, is dropped into a pail."

PYROGRAPHY.—This is a new art invented in England, and consists, as the name indicates, in printing by fire through a system of metallic cylinders, which burns into the wood any design required. From its nominal cost and great beauty, it seems likely to take the place of much of the expensive ornamentation and inlaid work now done by hand. The samples now on exhibition at the Fair of the American Institute, are panels of wood, printed with very beautiful and ornamental designs, in great variety; for car and carriage manufacturers, architects, builders, carpenters, cabinet makers, etc., this art must be very useful.—*Gas Light Journal*.

IRON-MAKING PROGRESS IN THE UNITED STATES.—We take the following figures from the address delivered at the Fair of the American Institute by A. W. Humphreys, Esq.:—In 1810 there were 54,000 tons of pig iron made in the United States. In 1869, 1,916,000 tons, having a greater value, by some \$5,000,000, than the gold and silver product. "Thirty years ago, not a ton of rails was made in America, the first rail having been rolled in 1843; while last year nearly 600,000 tons were made, more than half in Pennsylvania, and nearly 100,000 tons of it in New York, at Spruett Duvill, Troy, Rome, Syracuse, Elmira, and Buffalo, of a quality admitted to be far superior to the foreign rails generally brought here, and with which we are compelled to compete in price. The quality of our pig iron is better than three-fourths of that made in England, yet the question of quality is usually practically ignored, when discussing the question of sustaining in America the production of iron in any form. * * * The statistics of the Lake Superior district will place vividly before you the astonishing increase of the mineral development of our northern border. within a little more than a decade of years; beginning with 1856, when iron ore was first mined there in any quantity, there were shipped 7,000 tons of ore, but not a ton of pig iron was then made there; in 1869, 633,238 tons of ore were shipped over the two railroads leading from that region, and 39,000 tons of iron were made; during these 13 years, 3,000,000 tons of ore, and 400,000 tons of pig iron have been brought from what, 20 years ago, was practically a wilderness. Still further west, the Northern Pacific Railroad will open up another region, where a similar history will be repeated. Missouri has already begun her race in the same direction of industry; the whole tier of Southern States only need complete restoration from the fever and delirium which began in 1861, and from which they are now convalescent, to pour out from their northern frontier such stores of mineral wealth as would make us gape with astonishment, had not constant employment of that faculty made wonder at any display of material resources in the United States almost impossible."

ENLARGING PHOTOGRAPHS.—Prof. Fowler, in the *Philadelphia Photographer* describes a process for producing enlarged photographs, without solar printing. The small negative is made in the usual manner. He advises that the picture be taken with a long-focused lens at a long distance, only one principal object to be included in the view. "From the negative, print a transparency or positive upon glass. From this transparency make an enlarged negative in the usual manner, of any size desired. With the enlarged negative print enlarged positives. The glass on which these positives are printed is to be ruled over with white wax dissolved in ether, and polished with clean silk cloth. A colorless collodion, made with ammonio-cadmium, is used. After the picture is fixed, while yet wet, it is toned for a moment with a dilute solution of chloride of gold, afterwards with hyalochloride of mercury. Wash the picture and let it dry. The paper to receive the picture is prepared by floating on a solution of gelatin, ten grains to the ounce, and dried. For use, float the paper on clean water, until it lies quite flat. Then draw it once through the water and drain. Now place it upon the collodion film of the picture, cover with blotting paper, place flat weights thereon, and let stand until dry. Then, by means of a knife, cut the edges of the collodion, and the picture may be raised from the glass, mounted on the paper."

SKILLFUL MOULDING.—At the late Mechanics' Fair in Cincinnati, says the *Scientific American*, F. Lunkenheimer exhibited fine specimens of brass casting. "As an evidence of the skill of some person in his employ, there is shown a cup on the saucer with a spoon in the cup, all cast in one piece and at one time, showing no "fins" or marks where the flask joined, or the pattern parted; also a plate, knife and fork cast in the same way, and a little cream pitcher, with a big belly, all cast in one piece, without core, yet exactly like the original crockery from which it was made. We were given to understand that this ingenious piece of handiwork is produced by baking the sand mould and afterwards carefully cutting it away and replacing it again similar to statuary work."

Scientific Progress.

A NEW FIELD OF MAGNETIC RESEARCH.—Frederick Varley, F. R. A. S., read a paper before the British Association from which we quote: "It occurred to the author, in the year 1858, that as iron could be deposited by electrolysis, that if a permanent magnet were connected to the receiving pole of a battery and placed in a solution of ammonio-chloride of iron, and the dissolving pole of the battery with a plate of the same metal, iron would be deposited on the poles of the magnet, and in all probability would take up the true form of the magnetic curve, and we would thus get solidified magnetic rays. The use of the ammonio-chloride of iron gave but feeble results, as the deposit then obtained was exceedingly thin and slow in forming. Small but promising results were, however, obtained; the experiment was left in abeyance for the want of a better solvent than chloride of ammonium. This year, whilst experimenting with the new mode of electrolyzing iron by means of the solution of sulphate of iron and magnesia, a sufficiently large deposit was obtained to induce me to resume the magnetic experiments. Accordingly I placed a compound magnet into the depositing bath, and straightforth commenced electrolyzing magnetic rays. It may, and indeed, has been, asked by one of our most eminent chemists, what is the use of this mode of obtaining the contour and formation of magnetic rays, when it can be so simply obtained by means of iron filings sprinkled upon the poles of a magnet, or permanently recorded on paper in the manner so beautifully accomplished by the late Prof. Faraday? I would answer to this, that the formation of these curves, as shown by the iron filings, are a modification of the curves which magnetic rays assume in passing through non-magnetic substances; these are not the curves that would be formed if a magnet be plunged into a solution of a magnetic metal, and that metal allowed to crystallise under the influence of magnetic action. Now, if we find that when depositing iron on the poles of magnets that, instead of an uniform layer of metal, the deposited metal assumes another form, indicating the action of the magnet upon it, we have at once afforded a means by which we can get solid iron to crystallise and build itself up under the superintendence and coercive guidance of magnetism. Independently of the crystalline structure of the iron thus modified and grouped in the lines of these rays, we shall have something solid and tangible to examine. * * * Diamagnetic metals, such as bismuth and thallium, may also be deposited in a bath between the poles of a powerful magnet, and we may thus glean much information of the crystalline structure of these substances whilst crystallising upon the receiving pole of the battery. * * * We have thus obtained a new adjunct in physical investigation; the mode of research offers a means of experimenting in a countless number of ways. New facts must assuredly be derived from these researches. This magnet, which is the first that has given important results, has been in a depositing bath five weeks, and here we find that, instead of the coat of iron being uniformly deposited on the poles, it is almost entirely built up on the margin. I must admit that it gives a quite unlooked-for result; nothing can be more beautiful than the manner in which this formation of iron crystals have been arranged by the magnet. I will not theorise upon the results at present obtained, as I hope by pursuing the investigation to get solid facts."

EXPERIMENTS ON GOLD AND ITS COMPOUNDS.—J. P. Prat gives, in *Journal de Chimie*, as the result of his experiments as follows:—That nitro-muriatic acid chlorurizes gold in various degrees, and that this depends upon the composition of the acid, the quantity which is applied in reference to the gold, and the degree of heat; that pure gold can be readily and rapidly prepared and obtained in spongy state; that gold can be readily oxidized and salified by ox-acids; that there exists a liquid and volatile chloride of gold containing more chlorine than the sesquichloride; that there exists, likewise, a sesqui-iodide and a carbonate of gold; that there exist two oxides of gold capable of giving a new series of salts; and, lastly, that gold behaves in many instances like some of the other metals.

LOCAL GLACIERS IN THE WHITE MOUNTAINS.—At the Troy meeting of the American Association, was read a paper upon this subject, prepared by Prof. L. Agassiz. We give part of the conclusion:—"These facts show that there were local glaciers, on the southern as well as the northern slopes of the White Mountain ranges, moving in opposite directions; those on the northern slope moving northward, and those on the southern slope moving southward. * * * It follows from the facts enumerated above, as well as from a general consideration of the subject, that the local glaciers of the White Mountains are of more recent date than the great ice sheet which fashioned the typical drift. On another occasion I hope to show that the action of the local glaciers of the White Mountains began to be circumscribed within the areas they covered, after the typical drift had, in consequence of the melting of the northern ice-sheet, been laid bare in the Middle States, in Massachusetts and Connecticut, after even the southern portions of Vermont, New Hampshire and Maine had been freed, and when the White Mountains, the Adirondacks and the Katahdin range were the only ice clad peaks in this part of the continent. When in their turn the glaciers of the White Mountain region began to melt away, the freshets occasioned by the sudden large accumulation of water remodelled many of these moraines and carried off the minute materials they contained, to deposit them lower down in the shape of river terraces. I have recently satisfied myself, by a careful examination, that all this river terrace of the Connecticut River valley and its tributaries, as well as those of the Merrimack and its tributaries, are deposits formed by the floods descending from the melting glaciers. What President Hitchcock has described as sea-beaches and ocean bottoms near the White Mountain and Franconia Notches, as well as in the Connecticut River valley and along the Merrimack, have all the same origin. The ocean never was in contact with these deposits, which nowhere contain any trace of marine organic remains."

A NEW FORM OF SPECTROSCOPE.—Prof. C. A. Young, of Dartmouth College, has devised and had constructed a new form of this instrument which he describes in the *Journal of the Franklin Institute* for November. We quote briefly: "The light from the slit after passing the collimator, is transmitted through the lower portion of a train of 6 prisms of heavy flint glass each 2½ inches high, and having a refracting angle of 55°. A seventh half-prism follows, and to the back of this is cemented a right-angled prism by which, after two total reflections, the light is sent back through the upper part of the same train of prisms, until it reaches the observing-telescope. This is placed directly above the collimator, and firmly attached to it. Finally, a diagonal eye-piece brings the rays to the eye in a convenient position for observation. The instrument thus has the dispersive power of 13 prisms, and even with the low magnifying power of only five on the observing-telescope, shows perfectly the lines of aqueous vapor, which make their appearance between the sodium lines when the sun is near the horizon. Of course, everything shown on the maps of Kirchhoff and Angstrom is readily seen with it, and many lines hitherto."

DIMORPHISM OF TIN.—C. Rammelsberg refers to experiments made with tin by Dr. Fritzsche and other savants, and states that he concludes, as to the dimorphism of tin, as a result of researches which prove that the sp. gr. of tin obtained by electrolysis, and also that of the metal after exposure to cold, is far less (viz. from 7.143 to 7.195) than after the metal has been molten, when its specific gravity varies from 7.29 to 7.31. Its form (viz. crystalline) after fusion is, as far as can be ascertained, regular; but at a very low temperature this form is entirely modified, and belongs to the irregular system.

IRON BY ELECTROLYSIS NOT PURE.—Dr. Klein, says *Les Mondes*, has ascertained that the iron obtained by electrolysis is not, as has been often thought, the pure metal, but, on the contrary, a compound or mixture of iron and hydrogen, which, when heated to redness, gives off an enormous amount of that gas, and becomes, while greatly increasing in bulk, a silver-white, very soft, ductile, and malleable metal, which decomposes water readily below its boiling-point, and oxidizes most rapidly.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

WILL START UP.—*Chronicle*, Nov. 19th: The saw mill of the Exchequer Co. will probably start up work next week. Two weeks more of fine weather will get out the winter's supply of timbers and lumber for the mine.

GLOBE.—*Miner*, 19th: About sixty thousand feet of lumber already delivered for the mill, and carpenters are framing. Good progress made in the drift on the ore vein, and samples yesterday showed ruby silver.

MT. BULLION.—Last week the rock was hard and progress slow. This week, the ground is working better, and the tunnel going ahead at a satisfactory rate.

TARSHISH.—The three companies working this lode are still pushing ahead. The Schenectady winze is near making the connection from lower to upper works.

AMADOR COUNTY.

SUTTER CANAL AND MINING CO.—*Ledger*, Nov. 26th: This canal, which will carry 5,000 inches of water, miner's measurement, is 23 miles in length, from the 700-foot tunnel at Slabtown, now being run, to Sutter Creek. It will now be completed in three or four weeks. A cut 1,000 feet long and 20 feet deep, is nearly finished. Nearly two thousand feet of the iron pipe, thirty inches in diameter, is ready for laying. From Slabtown up the river nearly two hundred men have been constantly employed. The benefit to the county will be immense. It will furnish cheap water power for cheap quartz mills. We learn that the Amador, Oneida, Keystone and other mills will change from steam to water. Col. C. C. Bowman of San Francisco was the originator of the enterprise, and is now the President of the Co. There are immense gravel ranges and placer mines along the line of the canal known to be rich in gold, and we shall see a revival of mining that will remind us of the days of 1850-'51.

CONY.—On the contract to sink 100 feet, the price to be paid was \$28 per foot, it finished in 3 months, and only \$26 if not. It was done in 2½ months. The same parties have commenced on a contract for another 100 feet.

INYO COUNTY.

CERRO GORDO.—*Cor. of Independent*, Nov. 21st: Mr. Belshaw is running his furnace incessantly. Mr. Beaudry has made some improvements to his furnace, and intends to start it again as soon as a supply of ore can be obtained; which will be when the miners on the Belmont side complete their tunnels. The Belmont miners are in with their lower tunnel 375 feet, and have their track laid, which will expedite the working. They are in the upper tunnel taking out some fine silver ore. The Wittekind still work on their tunnel with two shifts. The rock is somewhat harder, but good headway can be made. This tunnel is in 140 feet. The Crowning Glory are in with their tunnel 150 feet, and are working night and day. The Oseola have their tunnel in 100 feet. The Friendship after having lain idle for a year, is being worked again with good results, although the shaft is only down 75 feet. It has produced since the present commencement two tons of first class ore, that will assay nearly \$450 per ton; two men having extracted that amount in about a month. Burns & Harrington, sinking upon the Sunburst, are down 75 feet, the ledge being ten feet wide, with spots of very rich ore. The Cumberland has changed hands. Dr. Gould, the purchaser, has changed the name to Buena Suerta, or "Good Luck." On this side, Hart & Co. are taking out the most ore at present.

NEVADA COUNTY.

MINING AT EUREKA.—*Gazette*, Nov. 26th: The Erie mill south of Eureka three miles, leased by Veatch & McCurdy, had a clean up on Tuesday last, after eleven days' crushing, and realized \$3,800. The mine and mill employ about fifty men. The rock yields on an average thirty dollars a ton. The ledge is seven to nine feet wide. Black & Irwin, are working thirty men, ten in their mill and twenty in their mine. They are taking out from \$1,200 to \$1,500 per month clear of all expenses.

GOOD RUN.—*Grass Valley Union*, 27th: The Eureka mine and mill had a good run for the twelve days ending yesterday. The clean up amounted to about \$30,000. It will be noticed that the Eureka has paid over \$2,000 per day for the last six months.

RICH STRIKE.—Telegram, Grass Valley Nov. 30th: The Hope Gravel struck a very rich deposit of blue cement, three feet thick, in the west drift to-day.

A SPECIMEN.—Same of 29th: A Chinaman on his way from Deer creek yesterday, picked up a quartz specimen worth \$30 from a rut in the road over which a wagon had just passed.

NORTH BLOOMFIELD GRAVEL CO.—*Transcript*, 22d: This Co. has gravel averaging a "hit" to the pan, and no hed rock. They are sinking an additional shaft a quarter of a mile further west, are down 70 feet, obtaining excellent prospects, and this week intend commencing a third one further down the ridge.

Same of 23d says of the same Co.: A correspondent writes that the hed rock has been reached in the shaft by the North Bloomfield Co., at a depth of 208 feet, through 138 feet of blue gravel which gave a number of colors to every pan the whole distance down to within 15 feet of the bottom, which yields from 15 to 25 cents to the pan—20 pans giving a product of \$3.83. They are now preparing to run a drift at the bottom, to ascertain the inclination of the bed rock northerly. The shaft in the Hiller Ravine is now down 83 feet, prospecting well all the way.

U. S. GRANT.—Same of 24th: This mine is at Carlile, Meadow Lake Township. The new stamp mill started up for regular work last Monday week. They have not yet cleaned up, but the rock is yielding handsomely, from the appearance of the battery. They have out about one hundred tons of first grade ore, and keep a force of twenty-two men constantly at work. The mine will be worked without interruption during the winter.

PLACER COUNTY.

NORTH FORK DITCH.—The Rattlesnake cor. of *Stars and Stripes*, Nov. 24th, says the ditch is being driven ahead energetically with Chinese laborers.

Dutch Flat cor. of same says: The mines which will be worked the coming season are waiting for rain, only one washing at present, Kelsey, supt. The law providing for the sale of mineral lands is having a good effect here. Many will avail themselves of it, and ground which has lain idle for years, will be entered and purchased.

PLUMAS COUNTY.

INDIAN VALLEY.—*Quincy National*, 19th: We are informed that a remarkably rich quartz ledge has been discovered in Light's Cañon. Messrs. Tanner & Cole found rich specimens of float quartz, and commenced a tunnel in search of the ledge; after running sixty feet, they struck a lode twenty-eight inches wide, and the richest rock ever discovered near Indian Valley.

TUNNEL.—The O'Neill boys, who have very flattering prospects in a shaft near Elizabethtown, but were unable on account of water to find the hed-rock, have commenced a tunnel which is expected to open up rich diggings.

POORMAN'S CREEK.—*Cor.* of same: Henly & Co. are well fitted up for the winter. Harry Brown & Co. are rigging up their claims for spring; so are White & Gains. Old man Riley has laid his prospect tunnel over till spring, when he thinks to strike it rich, on the South Fork. Evan Jones took out a nugget of gold on the main creek, opposite to town, weighing forty-two ounces, this week.

SISKIYOU COUNTY.

RICE.—*Yreka Union*, 23d: A very rich quartz ledge has been discovered on Salmon near Sawyer's Bar. A cut was being made along the mountain side for a road where the ledge was uncovered. The ledge is eighteen inches in thickness. Sheffield and others located a claim. It is in the vicinity of the Black Bear and Klamath.

TRINITY COUNTY.

PROSPECTS WELL.—*Journal*, 26th: We are told that the high and low bars on Trinity river, from Lowden's bridge to Cement hill, will pay half an ounce a day. There is no water, but Mr. Woods intends to extend his Rush creek ditch to cover the section.

TULARE COUNTY.

The *Visslia Times* of 19th says: New mines have been discovered near home, and we have some rock which, we think equals Yellow Pine rock. The parties owning assure us that the ledge is at least twenty-five feet in width at the surface. These mines are forty to sixty miles from Visalia, easy of access, and have abundance of timber and water. The owners intend to open their claims as soon as the Spring opens.

Nevada.

COPE DISTRICT.

MOUNTAIN CITY.—*Elko Chronicle*, Nov. 27th: All three of the mills are now in operation—the Vance crushing rock from the Blue Jacket, with small supplies from Bull Run and Bruno to test. Norton's mill is crushing rock from the Belle of the West, but will soon commence crushing

200 tons from the Excelsior lode for the Argenti Co. Drew & Co.'s mill is running on the Idaho. New discoveries are being made in Bruno. A ledge called the Lady Franklin and owned by Bohem, Mardis & Co., is thought to equal the Miners' Rest. The Spiritual ledge continues to show rich rock and abundance of it.

BULL RUN DISTRICT.—A friend writes Nov. 19th: "I have been spending the last week in this place, and you can bet we have mines here that are richer, more extensive, and more numerous than they are at White Pine or Mineral Hill."

SPRUCE MOUNTAIN DISTRICT.—*Elko Independent*, Nov. 26th: This is 40 miles southeast of Humboldt Wells. J. B. Osborne has a shaft down 120 feet, following a very rich silver bearing lead. On the side of the mountain below is an old incline tunnel connecting with the shaft from above, both shaft and incline showing the characteristics of those in the mining regions of Mexico and South America. In addition, later developments have proved that this is one of the richest countries yet discovered in Eastern Nevada, as the Latham, Schuyler, or Osborne mines will prove.

HUMBOLDT.

OREANA.—*Cor. of Silver State*, Nov. 26th: The large smelting works are closed pro tem. I hear that George Lovelock will reopen them. Torry and son have commenced smelting at their works on the river, and are getting out ore from their mine. The Miller mine, Relief District, will pay back to the New York company all the money it has expended on its other mines. The company is erecting workshops, etc., and is about to erect a mill.

CRYSTAL.—This is a promising mine, owned by James C. Wood and J. F. Cole. It is on the eastern slope of the main mountain. The ore assays from \$182 to \$431 the ton. The claim was located last August, and an incline, following the dip has been sunk twenty feet, exposing a fine body of ore.

CONTRACT.—The Potosi Co. has let a contract for sinking on the Potosi ground, one mile south of the Inskip, and the prospect, so far, is flattering. The vein tapped is said to be nearly five feet wide, and the ore of good quality.

INSKIP AND NORTH STAR.—As work progresses these mines continue to improve, both in quantity and quality of ore at present, a quantity of fine shipping ore is being taken out.

REESE RIVER.

An Austin telegram of 23d says: The Manhattan mill has just completed a run of 93 tons of ore from the El Dorado South mine, of Belmont, belonging to Leon & Co., which keeps up with the previous yield. The 90 tons gave an average assay value of \$240 per ton, and three tons yielded at the rate of \$303 per ton. The ore was obtained from the water level, at which point the lode is nine feet thick. The lot worked was selected from this vein in the proportion of one-third, the other two-thirds, averaging between \$60 and \$75 per ton, not being sufficiently rich to justify hauling. Upward of 1,200 tons of this class of ore are now on the dump at the mine, and the quantity is constantly increasing. Fifty tons of first-class ore are now on the way here for reduction.

DEEP SPRING VALLEY.—The Franktown Cor. of the *Inyo Independent* assayed ore samples from 23 locations, and found the lowest \$29, and the highest \$1,091 per ton. A sample of La Cruz ore assays \$7,491 in silver.

WHITE PINE.

The *News* of Nov. 26th says the principal mines on Treasure Hill have finished their preparations for winter; and without inconvenience will be enabled to work all the time. The Eberhardt Co.'s wire tramway, which will pass the dumps of the principal mines on the southern slope of the hill, will enable those mines also to deliver ore at the mills even when all the roads are blocked up with snow.

ITEMS.—South Aurora is steadily producing the same quantity and quality of ore during each week. The housings are finished. North Aurora is being partially worked by contract. Some fair ore is taken out of the Iceberg. On the Earl, close to the northern line, two shafts are being sunk. Out of the lower, ore is produced, which by mill workings has yielded \$75 to \$100 per ton. The shaft was down 25 feet and indications favorable. Eberhardt is improving daily. The working force has been increased to 25 men. It is surprising to see how advantageously the men have been put to work. Not only does the mine yield a fair quantity of the old rich chloride ore, but immense quantities of low grade ore have been put in such shape that they can be extracted in large quantities with little trouble. The lower works, have

demonstrated lately, that the claim below is as good as on top. Ward Beecher dumps are full, ore-house is full, and teams hauling away as fast as possible. A prominent gentleman of this city recently offered to the owners the sum of \$60,000 in cash for one month's lease of the mine, but was refused. Mammoth has still a small force at work prospecting the eastern part. Anchor has commenced shipping ore to the mill. On Thursday 27 tons were shipped. Work is to be pushed through the winter. Wahash has been enclosed, and is being vigorously worked. Some fine rock is taken out. Silver Wave, a small force is developing the mine, at the same time taking out fair ore. Noon-day still yields some good pay ore. On Chloride Flat, Sagebrush is taking out good ore; Posthole is prospecting; Industry has ore and is doing well; Nevada is yielding pay ore.

BASE RANGE.—Owing to the stopping of Gov. Matteson's works there is little to report. Most of the mines are nevertheless taking out ore, so as to be able to supply the furnaces as soon as they start up again, which it is expected will be shortly.

MILLS AND FURNACES.—The battery at the International mill is being put in place, and the mortars for 30 stamps are fixed. Tee pans and settlers, with their machinery, are in place. The engine heds are nearly finished. Work on the wire tram-way has been commenced. Its length will be two miles and 1,000 feet. It is to be finished in 30 days. Stanford mill, in Eberhardt, is running steadily on South Aurora ore. Oasis is working ore from the Eberhardt. Sheba has Ward Beecher rock. Metropolitan is running on ore from Chloride Flat. Big Smoky is running, and work has been commenced on the new roasting furnace. Swansea mill is crushing ore from the Original Hidden Treasure. Monte Christo has just finished a run on ore from the Maryland mine, in Pinto District, which gave great satisfaction. Powers' Furnace is shipping large quantities of base bullion. Hamilton Furnaces are both smelting Jennie A ore.

OUTSIDE DISTRICTS.—Eureka Consolidated Co. has declared a dividend of \$50,000. Parties are said to be negotiating for the Waller mines, in Robinson district.

ELY.—The *Record* says that the Burke mine, which averages eight feet in width from the surface to the 200-foot level, yields daily 50 tons of ore averaging \$300 per ton. Another mine, which belongs to Messrs. Rutherford and Hanchett, has an incline 200 feet deep, at which point the lode is six feet thick, the ore of which averages \$300 per ton.

MINERAL HILL.—*Eureka Sentinel*, Nov. 26th: There is not a more lively camp in Eastern Nevada than Mineral Hill—52 miles north of Eureka. Their new mill has been running for some time. The rock is the richest in the state, and the machinery perfect. A considerable amount of the ore worked has produced as high as \$1,500 per ton, and they now have in the mill 500 tons that will average \$500 per ton. The company that bought out the original owners have 29 mines, all of which are producing ore of high grade. The Grass Valley Tunnel Co. has been incorporated with a capital stock of \$600,000. The tunnel has been run 320 feet. Several spurs have been reached that assay \$10 to \$20. They are now within 250 feet of the Silver Queen, one of the best mines of the company.

BULLION.—From Palisade, the new town on the railroad, 85 miles north-west from Eureka, was shipped, for the week ending Nov. 24th, 132,255 pounds of crude bullion, and refined bullion of the value of \$61,715.85.

Colorado.

NEVADA DISTRICT.—*Central City Herald*, Nov. 19th: Work has ceased on a number of mines on Quartz Hill. Still rich ore is being taken from the Roderick Dhn, Kansas, Flack, Gardner, and California. The Kent County has a busy look, and several claims are being steadily worked. Bradley & Cree have put up a steam engine on this, and Collins & Co. one on No. 4 of the California. The latter claim, and Stalker's near, continue to yield 11 oz. ore. Bennett & Guy Bros., on the Kansas, have been taking out ore running from 10 to 13 ounces in stamp mill. P. M. Willingham, agent for the Rotary Stamp Mill Co., of Chicago, is putting up a ten stamp mill of that kind at the Flack lode.

DR. RAE is said to have obtained good results from his Electrical process at the Myers mill. We are told he obtained \$258 in gold by his process from ore that assayed \$271 per ton.

OHIO.—This mine, two miles south of Cariboo, already takes rank among the best lodes of Grand Island District. John Ba-

ker has a force of men working it, and also the Indiana, Eva, and other lodes. The assays have given from \$1,400 to \$500 per ton, the last considered an average.

(GEORGETOWN.—Cor of same: Stewart's old works are silent; the new, in full blast. The price of reduction has fallen from \$60 to \$35 per ton. At the Washington Co.'s mill, Mr. Bement is working Terrible 3d class ore and using Krom's Ore Dressers. The Georgetown smelting works are deserted. Burleigh tunnel goes ahead. The Brown lode has produced more rich ore this summer than ever before. The Terrible ships 500-ounce ore to England every month. Good ore comes out of the Mendota every where. The Helmick tunnel is in 400 feet. The Marshall, 900 feet.

(TREMS.—Register, Nov. 23d: Capt. Hall, of Elkhorn Gulch, has struck ore the first load of which assayed 500 ounces silver per ton. The Boston and Colorado smelting works will be ready for work by January 1st. Mr. Thatch has been working the Anoka County lode. He has thirty or forty tons piled up at the mill, which is worth \$50 per ton in gold. B. C. Waterman has sent five tons of first quality Flack ore to Swansva. He has also sold eighteen tons to Hill's smelting works and has quite a pile on the dump. In company with A. M. Jones he is also working on the Cooper. On this they are down 80 or 90 feet, and have a fine crevice. About ten cords are lying on the dump waiting for reduction in Whitcomb's new mill, which will soon be in operation. The Whale mine, at Spanish Bar, is looking better than ever before since '60 and '61. Quartz Hill Tunnel is in 545 feet, without having struck any lode of good pay. They have first-rate indications of cutting another vein soon. The Polar Star mill is putting in eight more stamps, making 32 in all. More ore is offered than ever before.

(GEORGETOWN.—Miner, Nov. 24th: On Saturday last the International Co. shipped a silver brick weighing 1,210 oz., coin value, \$1,100. Since last report the Stewart Co. have shipped silver bullion \$4,600, coin. The Cashier lode continues to turn out good ore. The Ocean Wave, is now furnishing good ore from the breast of the tunnel. On Tuesday the Brown Co. shipped a button of silver weighing 4,426 troy ounces, coin value, \$5,532. Since October 1st, 169 sacks of first-class Terrible ore has been shipped to England and a further shipment of 200 sacks leaves to-day. Last week the owners of the Correct lode received a bar of silver bullion weighing 105.20 ounces, valued at \$128.67, coin. We learn that a new discovery, called the Raymond, has been made in Spanish Bar District. One pan of dirt gave \$25 in coarse gold. The Rockefeller lode, Leavenworth mountain, is now in mineral. The Sterling is yielding very rich ore. The Silver Plume is yielding \$800 ore. Drifting continues with good results on the Snow-Drift. Eight men are employed. Work on the Magnet has been commenced. This ore in the 3d level of the Terrible is now worth 600 ounces per ton. Ore from the Bismark lately assayed \$1,600 a ton.

British Columbia

PEACE RIVER.—A letter appears in the Bulletin of Nov. 29th, from which we quote: The scene of the last discovery is a large creek, called Germansen Creek, 75 miles northeast of Vital Creek. It empties into Omineca river, a branch of the Findlay. A well defined trail exists between the landing on Lake Tahla and Hoganville, sixty miles. Lake Tahla landing is the junction of the two routes from the lower country, one by way of the Fraser river valley, and the other via Skeena river. The miners of Vital and Silver Creeks, with the exception of three on each, decamped for the new diggings immediately upon receiving information of their discovery. These diggings have the reputation of being shallow and rich. About four miles of the creek has been taken up, and it all proves of a similar character, ranging from three to six feet in depth. The miners who have communicated with their friends give flattering reports, but those who have temporarily returned to Cariboo, are reticent. According to statements from reliable sources, many of the companies are making \$25 to \$50 per day, per man. Provisions command \$1 per pound for every variety. The Cariboo mines are in a more prosperous condition than for years. William Creek, continues to yield largely. Several companies have taken out an average of one hundred ounces each per week, throughout the season. The attention of the mining community, appears to be centered on Lightning Creek, on which new developments are being continually made. The "Lightning Company" has yielded regularly throughout the summer from 200 to 500 ounces per week.

Idaho.

(TREMS.—Avalanche, Nov. 10th: The shaft on the Belgium mine is down about 12 feet, showing a good looking ledge 20 inches wide. Mr. Johnson is getting along finely with rebuilding the quartz mill below Fairview. It will probably be ready to run in two weeks. They have commenced taking ore out of the Oro Fino. In the Golden Chariot, the vein in the bottom of the winze south of the shaft from fifth to sixth levels, is over four feet wide, and the ore is as rich as ever. During November, up to last Wednesday, 700 tons of ore had been taken out, and as much more will be taken out during the remainder of the month.

WILLOW CREEK.—Boise News, 10th: A Chicago Co. are completing a ditch bringing in Burnt river; the ditch will be 80 miles long, 8½ feet wide on top, 5½ on the bottom, and three feet deep. They have four hundred men at work. The Co. have also projected another ditch which will bring in water from the Malheur; there are 700 men already there, and three towns: Malheur, Amelia and El Dorado. Mr. Green White, our informant, says the mines are first-class, that he got as good prospects as ever got in the Basin, and there is room for five thousand men.

Montana.

ARGENTA.—Helena Gazette, Nov. 21st: The Tootle Co., G. W. Stapleton, Supt., have been running their furnace day and night all the season, and shipping regularly buttons varying from 100 to 250 pounds every two weeks, and have this summer and fall shipped over a ton of pure silver. Mr. S. has run ores from Argenta and vicinity only.

PHILLIPSBURG.—From Mr. Hauser we learn that the St. Louis Co.'s mill has been leased to Captain Plaisted, and is now running. They have 300 tons of good ore to commence with. Cole Saunders' furnaces are also in operation.

TUNNEL.—The Miners' and Mechanics' Tunnel Co., at Cable City, have run their tunnel 900 feet into the hill, having been three years in the work, and will probably have to run 300 feet farther before striking quartz.

SURVEY.—Engineers are surveying the line of the grand canal from the Jefferson river to the Prickly Pear valley.

UNIONVILLE.—The Whitlatch Co., composed of the McClure brothers, Tom Argyle, N. N. Sensesderfer and J. W. Whitlatch, have leased the Whitlatch Park Co.'s mill, and are crushing quartz from the Parkinson lode. They employ 30 men, and have upon the dump 300 tons of quartz. A new incline is down 100 feet, and shows a body of rich ore three to five feet thick. The Columbia Co., of Philadelphia, own No. 3 west, on the Whitlatch Union lode, and employ now 40 men. The Co.'s magnificent thirty-stamp mill is running night and day on the rich ore, 4,000 tons now on dump. The incline is down 560 feet. No. 2 west, owned by the National Co. of New York, is putting up an enormous Cornish force pump, which has nine-inch lift and a five-foot plunge. The iron pipe is nine inches in diameter. Everything will be ready in a week.

RADESBURG.—Keating & Blacker, having made enough hullion for present use, have shut down for repair. Sample's mill was crushing Dunn's rock from his shaft on the Iron Clad at the rate of fifteen tons a day. The run would be at least \$40 to the ton. Three other shafts are worked on this lead. At least 300 men are employed in and about the quartz lodes here.

JEFFERSON GULCH.—New North West, Nov. 18th: Messrs Ruhl and Gregory, inform us there is only three hours water in the gulch, and only 15 or 25 men are washing. The Gregory Co. cleaned up \$1,000 for the last two weeks' run. A number of men have commenced drifting for the winter on the "back streak."

LINCOLN GULCH.—A. P. Rose writes that "only the Upper Drain Co. and two or three others are sluicing. The prospects on Sour Kraut Gulch are very flattering. The Discovery Co. is making \$15 per day to the hand. The Keep Cool Drain Co. will start up again in a few days."

EMMETTSBURGH.—We learn that a rich har was opened on the gulch, three-quarters of a mile above town, last week. It was purchased some time since with gulch claims, by Warren and Henderson. Last week they prospected it, and on Saturday, with 20 inches of water, two men took out in one hour and a half \$65. The bar is 2 to 4 feet deep and pays all the way. It is only 1,500 feet long.

The Independent says that Deer Lodge County has yielded not less than \$3,000,000 in gold during the past six months.

CEDAR CREEK.—The Missoula Pioneer of Nov. 17th says the Miners at Forest City

will keep at work during the Winter, and are covering the mouths of shafts and tunnels. There was three feet of snow there already.

New Mexico.

RALSTON.—Cor. of Press and Telegraph, Nov. 19th: Much has been said about what the California Co., intend to do, but as yet they have done nothing but comply with the District laws. Messrs. Harpending, Arnold & Cooper, three of the solid (?) men of this Co., arrived here, via Santa Fe, from San Francisco three weeks ago. They thought the quartz extraordinarily rich, said they must have a rail-road; talked of letting contracts for ties, grading, &c., but they lacked faith or had not the money. Mr. Harpending with a John Bull, who came with the party—started for New York to raise capital. Messrs. Arnold & Cooper remain, and have succeeded in getting several thousand feet hauled to them, for one dollar per foot. Many of the lodes are rich enough to pay a respectable dividend on all necessary out-lays, if properly managed. But I believe the time is yet far distant, when this will be done. Chloride District in this county has rich rock, timber and water in abundance. Men too, who although poor, possess more energy than the majority here, and by the time you receive this, they will have smelting works in operation. But alas for Ralston!

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Dec. 1.

The mining share market has been somewhat irregular this week, with a little falling off in sales from the preceding. We notice quite a number of sales of Amador, which commenced at 242½ and rose to 245. Belcher was steady until yesterday when it took an upward turn, and to-day sold at 5.

Chollar-Potosi has varied considerably, from 67 to 79. On the 29th ult., \$62,135 were shipped from the mine to this city. Crown Point sold, on Saturday, for 3. Last week 400 tons of ore were raised, valued at \$10,431. On Monday a delinquent assessment of \$3.50 was added, and the stock rose to 6. On Wednesday it varied from 6 to 8, and to-day there were large sales between 8 and 12, the shares finally reaching 13.

Golden Chariot has ranged from 68 to 73. The company reports \$52,826 received on November account. Gould & Curry has sold from 72 to 77½, but the sales have been very light. The report for the last week show 475 tons of ore extracted, of an average value of \$49.36. Hale & Norcross has had light sales at 101 to 106½. From this mine, 830 tons were raised last week. Mammoth sold last Friday at 30 cents, but has since come down to 25 cents. Meadow Valley has been in good demand, selling from 22 to 24½, closing at 24½. The company report receipts for November amounting to \$104,463. Ophir has varied from 2½ to 3½. Savage has sold, in larger amounts than any other stock, from 35½ to 39½; and Yellow Jacket from 29 to 35½. The Savage mine reported 715 tons of ore raised last week, of an approximate value of \$14,300, on which the profit is stated to be less than \$900.

Dividends were paid by the following mining companies last month: Black Diamond Coal, \$25,000; Natoma Water and M. Co., \$3,000; Chollar-Potosi, \$112,000; Eureka, \$40,000; Golden Chariot, \$30,000; Hale & Norcross, \$40,000; Meadow Valley, \$60,000; North Star, \$4,500; Sierra Nevada, \$7,500. Total, \$322,000. Total dividends October, \$270,300. Total dividends November of other local companies, not mining, \$199,658. Dividends in November of 1869, 1868 and 1867 were \$99,200, \$184,000 and \$185,000 from mining companies.

The total shipments of treasure from this city since January 1st amount to \$31,763,579, of which \$12,719,888 was sent by railroad.

The coinage of the Branch Mint, for November, was \$1,860,000 in double eagles, \$40,000 in half eagles, \$25,000 in quarter eagles, \$35,000 in half dollars and \$5,000 in dimes, the last not having been coined here for a long time before. Total coinage, \$1,965,000. Deposits at the Mint were \$112,404 ounces gold and 40,836 ounces silver.

The Narrow Gauge Railroad Company offered their stock upon the market. Subscriptions will be received until December 26th:

Exaggerating.

It seems to be the almost universal custom in America, for a writer to give an exaggerated picture in describing any locality. But few really true accounts appear in our papers of to-day. A state or territory is either the finest or the worst in the world, a medium condition being impossible, apparently. We are getting used to the habit, and rarely believe all that is narrated in such accounts; but people at a distance are very often deceived. Probably not one man in ten at the east has a correct idea of this coast; certainly not one description in ten gives a correct idea. We refer to the descriptions given by travelers.

One of the daily papers of this city lately published a letter written by a gentleman who has "lately arrived" here. The writer mixes up truth and fiction in the usual manner. While he says much that is true, he also says much which is not sustained by facts. Thus he dilates on the cheapness and excellence of our restaurants. We agree with the general statement that the restaurants are cheaper and better here than in any other part of the United States, as far as we know or can learn. We have been in restaurants in very many of the large cities in the North and East, and have, among our personal acquaintances here, people who have been in probably every large city from Maine to Louisiana. Our practical experience tallies with the above assertion. But when out late arrival talks of the possibility of obtaining "in excellent eating houses, where everything is cooked in the French style, * * * a plate of roast wild duck, a pot of splendid chocolate, coffee or tea, a piece of pie or a pudding, bread and butter—the latter of excellent quality—ad libitum, and a cigar, all for twenty-five cents; or a cup of coffee, two eggs, and all necessary accompaniments, including bread and butter, for fifteen cents; or any kind of a roast and a dessert for the same price," we feel strongly inclined to ask where such restaurants are to be found. If there are any such above the third or fourth class places, and which can with any justice be denominated "excellent," we should like to patronize them. As we board at restaurants, we are interested in the reply.

We have picked out this statement principally because it appeared in one of our leading city papers and relates directly to the city in which we reside. We have a due appreciation of the good points of San Francisco; but to spread abroad such statements is to show a spirit not cosmopolitan (a term we are very fond of here) but intensely provincial. We ought to state, perhaps, in justice to the paper alluded to, that it does not really endorse all that is said. Nor does it take the trouble to correct anything.

Farming in Montana.

[Written for the Scientific Press.]

City of Boseman.

Boseman, the last settlement going east, is situated in a fine, flourishing farming region and is the county seat of Gallatin county. Many new buildings are going up here, and among others a fine brick hotel. I stopped at the Guy House, one of the best hotels for rest and accommodation in this region. Fort Ellis is only three miles distant, where some 500 U. S. soldiers are stationed, with little to do, however, as the Indians in this neighborhood are very peaceable.

At the time of my visit the wheat crop was exceedingly promising; and although there is much land already under cultivation, many thousand acres are still laying idle in this valley, which might be taken up and successfully cultivated. There is a fine stream of water, the Gallatin river, flowing down from the mountain which may be extensively utilized for irrigation. There is good reason to believe that the Northern Pacific Railroad will pass through this valley and within about a mile of this town.

Boseman is probably to-day the most progressive town in Montana. Its advancement seems to be healthy, substantial and fully justified by surrounding developments. Unlike most other commercial points of the territory, it is independent of business fluctuations in the mines, and has for the foundation of its prosperity the sure and steady development of agricultural interests. It is the center of trade for

The Gallatin Valley,

About 10 by 30 miles in extent, which all admit to be the most extensive and productive farming district of the territory. The first settlements in this valley were made in the spring and summer of 1868. Alder gulch, or the great mines of Virginia City, having been discovered in the previous year.

Interesting Experience in Mountain Farming.

The first farm sites were located low down on the water-courses; the locators, wholly inexperienced in mountain farming, deceived themselves into the belief that they would there find the soil warmer, and consequently more productive. Failures were so frequent in 1864-5-6 that many of these pioneer cultivators concluded that only partial success was to be expected in Montana farming, and all parties settled down to a sort of slipshod management, which only looked to temporary residence in the country. Finally, experiments were tried back on the foot-hills, or table-lands, which proved abundantly successful. It was found that the frost did not linger there so late in the spring, nor appear so early in the fall; consequently the upland soil returned the cultivator large and well matured yields of every production ordinarily cultivated in these latitudes on the Pacific and in the states of the northwest.

All former ideas of cultivation were thereupon abandoned, and a complete revolution was thus inaugurated. Thenceforth the low-land farms—for the first three years esteemed the best—were only considered desirable for stock raising. The cultivation of the soil is now mainly confined to the table-lands.

[The experience of the Gallatin Valley farmers is but a repetition of that of many in this state, especially in the Santa Clara valley, in the cultivation of semi-tropical fruits. It is found that such fruits do better on the hill or low mountain slopes than in the valley below, and for the very same reason as observed in Montana. Cold air always descends, while warm air rises. Hence, within slight elevations, the air will always be found warmer on the hill-slopes than in the valleys. This rule fails when we get above the general level of the hills, because we then encounter large and cold upper currents of more permanent temperature, which interfere with, or rather pass over and keep down as it were, the local currents. Fogs, which

are due to sudden chills in the atmosphere, never form on the tops of hills, but always in the valleys.—EDS. PRESS.]

Productions, Etc.

The Gallatin valley is now famous, far and near, for its yield of small grains, while it produces all manner of excellent vegetables of first-class quality, such as potatoes, turnips, radishes, cabbages, squashes, and the like, and some young apple orchards are thriving and very promising. Experiments in the cultivation of forest trees also promise well. The editor of the *Pick and Plover* has quite a grove of black walnut trees now flourishing six miles south of Boseman.

Thus the agricultural development of Gallatin valley, which was at first inaugurated to supply the miners of Alder Gulch, is steadily advancing while mining camps are being established on all sides, until this valley has now become the grainery of the Territory. It has now, according to the last returns of the County Assessor, a little over 48,000 acres of improved land, and the aggregate grain yield this year is estimated at near one million bushels; there are three large grist-mills in the valley, running night and day, and a fourth is projected. There are over 5,000 head of cattle, in the county, and a large number of swine; and the population and fixed capital are represented to be doubling every six months.

Boseman is not only the trade-center of the valley, but it is also the key to the great valley of the Yellowstone and all the splendid country bordering to the eastward—supposed to be rich in mineral wealth and undeveloped agricultural resources.

In this connection, I cannot forbear paying an especial tribute to H. N. Maguire, editor of the *Pick and Plover*, for his untiring efforts in calling attention to, and his active and direct labors in building up Eastern Montana. His vigorous journal was inaugurated last January, during a period of trade stagnation and general business despondency; but as a long residence on the Pacific slope and in the West, had given him correct ideas of what might be accomplished in the development of Eastern Montana, he was not discouraged by the prospect, and is now reaping a just reward for his efforts. I shall furnish you some further agricultural and other facts from this interesting region in my next.

W. H. M.

An Extraordinary Melon.

Our correspondent, "L. P. Mc." writes us that R. Marchella, proprietor of Marchella's saloon, Oroville, has raised a few of the *Turkish melons* this year, (the proper name is *Buciri*.) They are the only specimens of the kind in California, and probably in America. From the difficulty experienced in obtaining the seed, which I shall not attempt to explain in this letter, it cost Mr. M. \$50 to obtain 100 seeds. This melon does not differ very much either in size or shape from the ordinary Musk-melon, except that it is little darker in color. Its other peculiarities, however, are very distinct. The taste is slightly nutmeg-flavored, but much more solid and nutritious. If hung up in a dry cool place it will keep from 18 months to two years. In fact it tastes best (in February or March,) after being hung up six months. The opinion of your correspondent is, that it is the best tasting melon in America. The seed could not be purchased for love or money before another season.

ALKALI SOILS FOR ROOT CULTURE.—Persons in the mountains and elsewhere who have alkali soils on their farms will be interested in the following item from the *Sacramento Union*.

We have been shown by John A. Anthony of this city, some fine potatoes and turnips raised near Mill City, on the line of the C. P. railroad, and sent to him as samples of the crop that can be raised on the alkali ground in that vicinity. The potatoes were of a mammoth size, perfectly sound, and when boiled were as white and mealy as could be desired. The turnips were very large, one weighing 19½ pounds and five of them being large enough to fill a sack of moderate size.

A LONG SQUASH VINE.—At Worcester, Massachusetts, there was a squash vine 1,112 feet long, which produced this season 350 pounds of squashes.

Sugar and its Production.

At the present rate of increase but little time will elapse before the consumption of sugar in this country will reach an annual value of \$200,000,000. The chief part of the sugar now consumed here is grown abroad, and only refined in the United States. More than half the cost of sugar, in a condition for consumption, is involved in its production from the soil and conversion into "raw sugar," in which state we obtain it from abroad. How important then that we should save this great outlay of money, and produce the value from our own soil. It would be worth more to the country than all the gold of California.

The success of the beet sugar production in this state, is a most promising event in this connection. We look forward with much confidence to the time when California will not only produce her own sugar, but will raise and refine immense quantities for the supply of the interior portion of the continent, if not for the Atlantic seaboard. A thousand acres of land devoted to the production of sugar will benefit this state more than the cultivation of 30,000 acres of land devoted to wheat.

Change a Law in Agriculture.

We clip the following remarks on change of rotation in agriculture from *Forney's Press*: "The farmer grows a certain variety of potato year after year, until it fails to produce the same good crops it once did. He sends a few hundred miles for new seed of the same variety, and it will at once, and without adding anything to the soil, produce as good crops as it ever did. We have heard agriculturists deny the possibility of this, but we think that most practiced farmers know that this is really the case. Yet surely the same variety of potatoes require only the self-same elements. There has been no other difference but the change.

So also in the matter of manure. People sometimes find benefit from phosphates, or guano, or some other commercial fertilizer. But in a few years it turns out to be no better than brick dust; but any other kind of manure will have a wonderful effect. We knew a friend once who used to raise enormous crops in his vegetable garden, which was annually manured from his horse stable. It failed at last. Even weeds seemed to disperse it. He changed from horse to cow manure, and again wonderful crops awarded him. Chemically there was not much difference in the manure. The change was more than all.

It is well to remember that as a general principle, Nature loves change. There is a seeming contradiction, for we speak of the certainty of nature's laws. But those who know her best, know that she has laws which seem contradictory. The same elements that make fire, largely make water, which is the enemy of fire; and some of her most harmless elements will often unite to make the deadliest poisons. At any rate, constant as she generally is, we know she sometimes likes a change.

SWEET POTATO VINES FOR FODDER.—A correspondent of the *Farmer and Artisan*, writing from Barnwell, S. C., says: In our ordinary plantation system, the supply of long fodder for stock is generally made a secondary consideration, and, consequently, is never abundant. In the middle and lower counties of this state, where the sweet potato is largely planted, an addition of considerable value may be made to the fodder left with but little trouble. I have long been in the habit of going into my potatoe before frost—say about the 10th of October—pulling by hand the vines, and immediately putting them into compact cocks about twice the size of a flour barrel. They remain thus four or five days, when the cocks are thrown down for three or four hours' sun, and then hauled in and housed. It makes an excellent hay. Horses eat it with avidity. The greater facility with which the potatoes are dug, after the beds are cleansed of the vines, saves the expense of making the hay.

PRESERVING POTATOES IN SAND.—It is claimed that if sweet potatoes are carefully packed in perfectly dry sand so that they will neither touch each other nor the sides of the packing vessel or box, they may be thus kept for twelve to fourteen months as sound as when first taken from the earth.

TOMATOES FROM CUTTINGS.—George Henning, Saratoga, N. Y., informs the Farmers Club that he plants his tomato-seeds in January and February, and when the plants are five or six inches high, cuts off the tops just above the seed-leaves, and sets them out as cuttings in a properly prepared hot-bed, where they take root and grow. In April, they are transplanted to cold frames, and finally set out in the open ground. Mr. Henning claims that by this treatment the plants have better roots than when allowed to retain their original ones, and that they bear earlier and are more productive.

CASTOR BEANS.—The Pacific Oil Works of this city advertise that they will contract, at good prices for all the castor beans raised in the southern part of the State, and furnish seed on credit to reliable parties, if necessary. The same institution is also a large buyer of the same product in other parts of the State. Our farmers know or ought to know the peculiar adaptability of the soil of a large portion of this State for the culture of the castor bean, and they should also know that its cultivation promises large profits.

A GOOD WAY TO DESTROY STUMPS.—A little excavation is made under the stump, between two of the large roots, some combustible material put in, and then set on fire. Previous to this, however, some dry materials should be piled around the root, above the surface of the ground, and covered over with a compact layer of turf, forming a sort of coal pit. It has been found, upon experiment, that the stumps will burn in this way a number of days, with a sort of subterranean fire; and, when the turf falls in, nearly all of the root is found consumed below and above the face of the ground.

The hole left by the consumed stump will contain a quantity of ashes, charred wood, burnt earth, etc.,—all valuable fertilizers—a part of which may be thrown out for use elsewhere, and the crater or hole then filled up to the level, with fresh turf or earth.

DOWNING ON CALIFORNIA FRUITS.—Downing's standard work on the "Fruit and Fruit Trees of America," has just passed to another edition, which has been enlarged by several additional chapters on the fruits of California.

VALUE OF FARM ACCOUNTS.—A correspondent of the *Boston Cultivator* writes that since he first began to keep careful farm accounts he has cleared double the money, which he had before—which increase he ascribes mainly to this practice named.

Household Reading.

How to buy Meat.

The following hints on buying meat for the table will be found worth hearing in mind. They should be read over and over until the facts are familiar. Then go to the butcher's and practice upon, and verify what has been learned. When once fairly fixed in the mind, by practical examination, they will never be erased:—

BEEF.—In buying beef, the finest grained is the best; the flesh should be light red, and the fat a light cream color, but not yellow—it should also be hard and firm. Ox beef is best, and the animal should be about five or six years old. Heifer and cow beef may generally be known by its being a little paler than that of the ox. The meat of an old animal is dark red, and the fat skinny and tough. If the meat rises quickly when indented with the finger it is good, otherwise not.

MUTTON.—The lean of good mutton is somewhat darker than that of beef, and the fat whiter. Old mutton is darker than young, and when fat and juicy is better—say up to four or six years of age.

LAMB should be pale red and fat.

VEAL should be of a light color, with plenty of fat, especially about the kidneys. The flesh should be drier than beef, and finer. If coarse grained, moist or clammy, reject it. Veal should not be over ten or twelve weeks old. It is less healthy than either beef or mutton.

PORK, if ever brought to the table, should come from an honest butcher, and should be examined by the buyer with close scrutiny. It is never a healthful meat. The skin of pork should be thin and smooth and white, and the flesh both lean and fat, should be firm. The lean should be a light red. If it feels flabby or clammy it is not good. Examine it close for kernels or hard bunches; if any such thing is found have nothing to do with it. There is more diseased pork sold than of all other meat together, and it is bad at the best.

Meat of any kind—flesh, fowl or fish, after being brought to the house should be wiped clean and dry with a dry cloth, and carefully examined for fly-blows, if in the season of flies. If a loin piece be purchased, take out the long, white, marrow-like string which is usually exposed by the side of the bone. It will become tainted in less than half the time required for other portions of the meat, and if allowed to remain, will effect the entire joint.

POULTRY.—A very correct judgment can be formed of the age of a fowl by the state of its legs. If the scales are rough it indicates age. If the under bill is so stiff that you cannot bend it down, or if the comb is rough, or the spurs hard, you certainly have hold of an old fowl. The legs of a young hen are smooth, glossy and fresh-colored, whatever the shade may be; the claws are also tender and short, the under-bill soft and comb thin and smooth.

An old hen turkey has rough scales on her legs, callosities on the bottom of her feet, and long, strong claws. A young one has the reverse of all this. In all kinds of poultry the breast should be broad and plump, the feet pliable, and the toes easily broken when bent back. Young and tender poultry may also be judged by pressing the lower end of the breast bone: if it yields readily to the pressure, it is not old.

A tender goose or duck may be determined by raising the wing; if the skin tears easily the fowl is tender. If you can easily insert the head of a pin into the flesh of a goose or duck it is tender and young. The strength of the joints of the legs and the coarseness of the skin generally is a good guide in buying a goose or duck. Such a test is also more or less applicable to all other fowls.

FISH.—In purchasing fish, care should always be taken to have them perfectly fresh. To know whether it is or not, aside from the smell, observe the eyes—if they have a bright, life-like appearance the fish is fresh; but if they are sunken and dark colored, or have lost their brilliancy, the fish is too old for a good fry or bake. If the dealer is honest, the buyer may judge by the redness of the gills; but some fish-mongers knowing this will color them to deceive their customers. But they can't paint the eyes—look at them.

Our readers, after carefully studying the above directions, need never be deceived in the character of the meat which they buy.

Don't Eat Without an Appetite.

It is wrong to eat without an appetite; for it shows there is no gastric juice in the stomach, and that nature does not need food; and, not heeding it, there being no fluid to receive and act upon it, it would remain there only to putrefy, the very thought of which should be sufficient to deter any man from eating without an appetite for the remainder of his life. If a tonic is taken to whet the appetite, it is a mistaken course; for its only result is to cause one to eat more, when already an amount has been eaten beyond what the gastric juice supply is able to prepare.

The object to be obtained is a larger supply of gastric juice, not a larger supply of food; and whatever fails to accomplish that essential object, fails to have any efficiency toward the cure of dyspeptic diseases. The formation of gastric juice is directly proportioned to the wear and waste of the system, which it is to be the means of supplying, and this wear and waste can only take place as the result of exercise. The efficient remedy for dyspepsia is work—out-door work—beneficial and successful in direct proportion as it is agreeable, interesting and profitable.—*Hall's Health by Good Living.*

Hints About Housekeeping.

We give to intelligence, to religious and to all virtues, the honor that belongs to them. And still it may be boldly affirmed that economy, taste, skill and neatness in the kitchen have a great deal to do in making life happy and prosperous.

Nor is it indispensably necessary that a house should be filled with luxuries. The qualifications for all good housekeeping can be displayed as well on a small scale as on a large one.

A small house can be more easily kept than a palace. Economy is most needed in the absence of abundance.

Taste is as well displayed in placing dishes on a pine table, as in arranging the folds of a damask curtain.

Skillful cooking is as readily discovered in a nicely baked potato, or a respectable Johnny cake, as in a nut brown sirloin or a brace of canvas-backs.

The charm of good housekeeping is in the order of economy, and taste displayed in attention to little things has a wonderful influence.

A dirty kitchen and bad cooking have driven many a one from home to seek comfort and happiness somewhere else.

Corrupt Blood.

The commonest scratch of a pin on the hand of a man whose blood is corrupt, will not get well for months; if the skin is abraded or scraped off by a misstep or other accident, a running sore is sometimes established for life, it is because the blood is bad; it is poor, too thick, and even poisonous.

Persons have poor blood when it is observed that scratches and cuts and bruises are a long time in healing, and this should be a friendly warning to correct that condition of things, because it shows there is but little vitality, little stamina, and disease of some kind is impending, especially of the typhoid type, and recovery will be slow, doubtful, and in many cases not possible.

The first step to be taken in all cases, to get rid of bad blood, is to spend a large portion of daylight out of doors in remunerative labor or agreeable employment, or in journeying, on horseback being the best; this helps nature to work the bad blood out of the body, and at the same time gets up a good appetite and a vigorous digestion, which makes pure blood supply the place of the bad, and the man is well without an atom of medicine or a dollar's expense.

HOW TO BOIL TOUGH MEAT TENDER.—Alexander Forsyth—who besides being an original genius, was once a pupil of Louis Philippe's head cook—says that while tough and lean meat is made tougher and leaner by being boiled in water, it may be made tender, and have the requisite fattiness applied, by being boiled in suet or other fat. He says that a thin lean strip of beef, of the toughest and cheapest character, may be rolled into a cylinder-shaped mass, bound with cords, and boiled in suet, in a small vessel of nearly its own size and shape (so that but a small quantity of the fat will be needed), and thus made fat, tender, delicious, and fit for an epicure. The experiment is simple, easily tried in any kitchen, and it looks promising. Fatty oils boil only at from 600° to 700° F.; while water boils at 212°. The same result is attained by boiling in oil that would be reached by boiling in water under great pressure, as in a steam-boiler.

Household Receipts.

SOUP WITHOUT MEAT.—Pare and slice four onions and eight potatoes, and put them in a kettle with six quarts of water. While they are boiling, toast a few slices of bread, which, when toasted, butter and lay in a soup dish. When the potatoes and onions are well cooked, season well with salt and pepper, pour over the toast and serve hot.

EGG CRACKERS.—Four eggs, one-half cup of butter, one coffee cup of sweet milk. Mix quite stiff. Pound the dough ten or fifteen minutes. Have all the ingredients cold. Bake three quarters of an hour in an oven nearly as hot as for bread. Cut them into small cakes one-half an inch thick.

RAISIN CAKE.—One pound of flour, one pound of sugar, one-half pound of butter, half-pint sour cream, five eggs, one and a half pounds of raisins, one nutmeg, and one heaping teaspoonful of soda.

CHOCOLATE CARAMELS.—Put in a saucepan, over the fire, one cup of ground or crushed chocolate, one cup of common molasses, one cup of milk, and a piece of butter as big as an ordinary hen's egg; stir all the time while boiling. Try it in cold water; if it hardens, it is done.

ANOTHER.—One cup of sugar, one cup of molasses, one cup of cream, one cake of chocolate, one tablespoon of flour, half bottle of vanilla. Boil half an hour.

ICING FOR CAKE.—For a large cake, sift a half pound of white sugar, with four spoonfuls rosewater, and the whites of two eggs beaten and mixed well, and when the cake is about cold, dip a feather in the icing and cover the cake. Set it away in some dry place.

Mechanical Items.

TO PREVENT ESCAPE OF GAS FROM INDIA-RUBBER TUBING.—India-rubber tubing is slightly permeable to gas. The amount which escapes through the walls of the tube is, however, very small, it may be advisable sometimes to render an escape impossible. This can be done by giving the tubing a thin coating of a varnish made by dissolving one part and a half of treacle and two parts gum arabic and seven parts of white wine and 3½ of strong alcohol. The treacle and gum must be first dissolved in the beer or wine, and the alcohol must be added very slowly, constantly stirring the strong mixture, or the gum will be thrown down.

PERMEABILITY OF CAST IRON BY GASES.—When stoves are red-hot, the gases of combustion leak through their pores like water through a sponge. This is one of the chief causes of the unhealthiness of rooms thus heated.

JAPANESE CARPENTERS are ingenious workmen, and their work is done with marvelous neatness. A curious feature of their houses is that they do not contain a single nail, all of their joints and timbers being dove-tailed together by many ingenious devices; and the whole work, even the rafters, is as smooth as if it had been polished down with sand paper.

The steam power employed in this country is equal to 130,000,000 of men, but that of Great Britain is superior, being equal to 400,000,000 of men.

DIAMONDS ON WINDOW GLASS.—Dissolve a sufficient quantity of dextrine in a concentrated solution of sulphate of Magnesia, sulph. of zinc, sulph. of copper, or any other salt; strain, paint over the panes quite thin, and let dry at common temperature (very slow), keeping the panes level. This coating can bear some rubbing. In order to protect it the better, varnish with any alcoholic varnish. The panes look like being incrustated with diamonds, sapphires, &c., according to the color of the salts.

HOW TO DEODORIZE TANNIN.—The peculiar odor given off by commercial tannin is caused by a greenish colored resin which it contains. This resin may be removed by the following process: Dissolve six parts of tannin in 12 parts of hot water; then add about one part of ether and shake vigorously. The mixture will appear cloudy and greenish; but after standing a few hours, the greenish matter separates into coagulated flakes. The fluid may then be filtered and evaporated to dryness, and the tannin thus produced will be perfectly odorless.

WOODEN CARPETS are now being used in preference to oil-cloths for the sake of greater neatness, cleanliness and its lower price.

ICE BOXES should always open at the top instead of from the side, as the passage of warm external air is facilitated by the latter mode.

Life Thoughts.

IDLENESS has no advocate, but many friends.

FANCY runs most furiously when a guilty conscience drives.

NEVER sigh over what might have been, but make the best of what is.

THERE is in this world no unmixed evil. **RELIGION** is not mere sentiment. It is a vital experience of the heart, a resolute exercise of the will, a heroic service of the life.

DAILY NOT WITH EVIL.—If you have been tempted to evil, fly from it; it is not falling into the water, but lying in it, that drowns.

HATRED AND LOVE.—The deadly weapons of hatred must be blunted and entirely changed by the mild, strong hand of love.

HOW TO WIN HAPPINESS.—To rejoice in the happiness of others, is to make it our own; to produce it, is to make it more than our own.

FORGIVENESS.—The brave only know how to forgive. Forgiveness is the most refined and generous pitch at which virtue can arrive. Cowards have done good and kind actions; cowards have fought, nay, sometimes even conquered; but a coward never forgives. It is not his nature.

POLITENESS may prevent the want of wit and talent from being observed; but wit and talent cannot prevent the discovery of the want of politeness.

THE HUMBLE SOUL is like the violet, that grows low, hangs the head downwards and hides itself with its own leaves; and were it not that the fragrance of his many virtues discovered him to the world, he would choose to live and die in secrecy.

A Golden Thought.

A more beautifully expressed thought than the following is rarely met with in the current literature of the day:—

Nature will be reported. All things are engaged in writing their own history. The planet and the pebble go attended by their shadow. The rolling rock leaves its scratches on the mountain side; the river its channels on the soil; the animal its bones on the stratum; the fern and leaf their modest epitaph in the coal. The falling drop makes its sepulchre in the sand or atone; not a foot steps into snow or along the ground, but prints, in characters more or less lasting, a map of its march—every act of the man inscribes itself on the memories of his fellows, and in his own face. The air is full of sound—the sky of tokens; the ground is all memoranda and signatures, and every object is covered over with hints that speak to the intelligent.

The Sexless Soul.

The following, which lately emanated from the pen of MacDonald, is one of the most beautiful thoughts which has been born of the newly inaugurated discussion upon the Women's suffrage question:—

Suffrage is not a question of color, but of sex. And what is sex? An ordination of nature for the perpetuation of the human race, relating only to the perishable body, and not to the immortal soul. The imperishable soul has no sex; the everlasting mind has no sex; the angels and arch-angels have no sex, and that distinction is unknown among the viewless throng that march the causeways of the air; for it is unnecessary where there is neither birth nor death, neither marrying nor giving in marriage, and where no soul was ever divorced from the bosom of its love. It is not a slave-like body that votes; it is not the piece of paper that bears the inscription; but it is the absolute human will, the great, the God-like, indestructible, sexless soul—that which is to live on and on after the last star shall have expired and departed from the desert heavens.

HOLD ON!—Hold on to your tongue when you are just ready to swear, lie, or speak harshly, or say improper words.

HOLD ON to your good name at all hazards for it is of more value to you than gold, high places, or fashionable attire.

HOLD ON to the truth; for it will serve you well, and do you good throughout eternity.

HOLD ON to your virtue; it is above all price to you in all times and all places.

HOLD ON to your good character; for it is, and always will be, your best wealth.

HOLD ON to your temper when you are angry, excited, or imposed upon.

Scientific Press.

W. B. EWER,..... SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY,..... GEO. H. STRONG,
W. B. EWER,..... JNO. L. DOONE.

Office, No. 414 Clay St. below Sansome.

Two Editions.—We now issue a mining edition and a farming edition of the Press. The difference consists in changing the reading matter of the 6th and 7th pages [All advertisements appear in both issues, affording an immense circulation.] Subscribers will please notify us if they do not receive the edition they prefer. Both editions furnished to one address for \$7 per annum.

Gold and Legal Tender Rates.

San Francisco, Thursday, Dec. 1, 1870.—Legal Tenders buying @90%; selling @91%. Gold in New York to-day 110%.

NARROW GAUGE.—Mr. D'Aligny, one of the U. S. Commissioners to the Paris Exposition, writes to the *U. S. R. R. and M. Register* that we shall soon have a number of branch roads in the U. S., on the 2 ft. 6 in. gauge, for the general transportation of minerals, freight and passengers. The first one contemplated is to be built this winter to connect the Iron Hill mines with the Eastern Kentucky railroad. The U. S. Narrow Gauge R. R. Co. is being organized for the same purposes as the company lately incorporated in this State. At present the company expects to build branches or feeders to main trunk roads, but the writer is convinced that ere long many through single roads will adopt the narrow gauge. He says: The economy of the construction and equipment of a narrow gauge road, 2 feet 6 inches, is immense when compared with the cost of a road 4 feet 8½ inches. For a single track it is 50 per cent. over an ordinary flat country, but in mountainous or mining districts the proportion increases to 75 per cent. and more. In fact, a narrow gauge road can be established and will prove a paying concern in countries so rough that no attempt would be made to construct a road of the usual 4 foot 8½ inch gauge. I am aware that many arguments are now brought against the narrow gauge roads by people accustomed to a certain routine in railroading. But I close these hasty remarks by saying that within a very short time the standard narrow gauge roads will accomplish a revolution in our railroad system in the United States.

C. P. R. R.—During October, there passed over the Central Pacific Railroad 26,074 passengers bound east, and 28,450 bound west. The number of through passengers both ways was 5,175; of way passengers 48,875; free, 474; total, 54,524.

THE FIRST RAIL OF THE STOCKTON AND COPPERPOLE RAILROAD was laid at Stockton on the 29th ult.

TOANO.—The new road from Toano to Boise City, 130 miles long, is now completed.

Treating Silver Ores in Mexico.

Mr. E. B. Smith, who has had charge for seven years of the Pittsburg and Sonora M. Co., of Sonora, Mexico, has recently called on us, and from his account we are enabled to make some statements on the treatment of ores as there practiced, which will interest many.

The works are situated on the Yaqui River, about 140 miles back of Guaymas. The company work three mines,—the Ramona, La Dura and Grijola, and their lowest workings are some 250 feet below the surface. The average width of the ledges is about 12 inches. The gangue is quartz. The ore has given considerable difficulty, containing, besides the silver, large amounts of lead, copper and zinc. It will average about \$125 to the ton. The mill, of 8 stamps, is about a mile from the mines.

Amalgamation failed to give satisfactory results. Only about 50 or 60 per cent of the silver was extracted, and the hullion was very base. Next chlorination and lixiviation was tried, and after a number of experiments, in which several ways were given up, some merely on account of the great difficulty and expense of obtaining the necessary chemicals, the following process was adopted with success.

The ore is first crushed under the stamps. Crushing very fine has been found to give poor results besides costing more than is necessary. If the ore is very fine, the water filters through too slowly and the process is more objectionable in several respects than when the rock is coarse. That passed through a No. 30 screen chlorinates as well as the finer, and filters better. Even this seems too fine at times, and a No. 24 screen is to be tried hereafter.

The crushed ore is roasted with salt in a long reverberatory furnace with 3 hearths or floors, raised 4 inches higher than the next preceding. Plans of a similar furnace are given in the Press of July 2nd, of this year. The furnace has a total length of 30 feet and a width of 10 feet. It has been found necessary to have the arch at least 26 inches above the floor of the lowest hearth, in order to get sufficient heat in the upper without melting the ore on the lowest one. The roof may, perhaps, be inclined downwards as it extends over the higher hearths with advantage. A charge is 800 lbs for each hearth, and this amount is drawn out every two hours. From 8 to 12 per cent of salt is used according to the character of the ore; and 5 men are employed during each shift of 12 hours.

Brückner cylinders were tried here at a former day. They were very poorly constructed and were at first revolved too rapidly. Mr. Smith took them in hand, however, rebuilt them, ran them very slowly, from one revolution in one minute to one in five (and he thinks the last preferable), and obtained good results. But a flood, two years ago, destroyed the company's works and carried away the cylinders, which have never been replaced.

The roasted ore is cooled and dampened, so that it will "ball" in the hand. This causes it to swell and act better in the following process than if put in dry. It is then put, in charges of 3 tons, into tanks 9 feet long, 4 ½ feet wide, and 30 inches deep, with the bottoms sloping to a point to facilitate the exit of all the liquid. There is a false bottom of slats, covered with coarse cotton sheeting, which serves as a filter. Water is now put into the tanks and this dissolves the chlorides of the base metals, copper, lead, zinc, etc., without touching the chloride of silver. When a test shows that the base chlorides have been removed, a solution of hyposulphite of lime is added, in which the chloride of silver is soluble, until all the precious metal is removed.

The solution is now led into precipitating tanks where sulphide of calcium is added until all the silver is thrown down as a sulphide. In the mean time this reaction changes the sulphide of calcium into hyposulphite of lime, which is used over in the leaching tanks. The silver sulphide is

strained and pressed in canvas bags, and dried and roasted in a small reverberatory furnace. As some sulphur still remains, it is melted in crucibles with scrap iron, and now yields bullion from 900 to 950 fine.

The sulphide of calcium is manufactured by boiling, with steam, pulverized sulphur (40 per cent) with lime (60 per cent) in an (iron) vessel partly filled with water. The hyposulphite of lime is obtained, when it is required fresh, by precipitating the base chlorides from their solution by the sulphide.

By this treatment from 85 to 90 per cent of the silver is obtained from the ore, whether rich or poor. The cost of treatment, with 8 tons treated daily, is not over \$15 per ton. To one ton of rock about 20 lbs. of sulphur and 30 lbs of lime are used. In 24 hours, 10 men are employed at the furnaces, 4 on the tanks, 2 as battery-feeders and 2 as firemen, with 2 engineers, 2 foremen of the tanks and furnaces and 1 overseer. Wood costs about \$3 per cord.

The hullion is sent to the mint where the coinage charges amount to about 5 per cent and counting the duty of 8 per cent shipment etc., the charges from the time the bullion leaves the mill until it arrives in San Francisco, amounts to about 15 per cent. Mr. Smith has had complete charge of the works since they were started, and to his energy and ability their success is almost entirely due.

The Roberts' Ditching Machine.

The California Peat Company, owners of this machine, have been experimenting with the ditching portion (i. e. without the pulping apparatus) on Twitchell Island. A committee appointed to examine the working of the device, has lately made a report to the company, which, at our request, has been furnished us for publication. One of the committee, Mr. Bowers, whose name is signed to the report, is probably as well qualified as any one in the State to judge of the merits of such a machine, being himself an inventor and familiar with all the ditching, dredging and excavating apparatus now in use. Having two applications for patents for machinery intended for similar work now pending through our agency, he would not be likely to over-rate the merits of a rival machine:

To the Trustees of the California Peat Company:

GENTLEMEN:—The following unsolicited editorial notice of the ditching machine belonging to this company, appeared in the *Alta California* of the 22d instant:

"The Roberts' Ditching Machine, invented in Wisconsin, and improved here, has lately been used on Twitchell Island, where it cut a ditch six feet wide, three and a half feet deep and thirty-two feet long, in seven minutes. W. C. Walker who has superintended much of the tule reclamation, considers the machine a success, and thinks that with its aid, he can make tule embankments that shall not cost more than seven cents per cubic yard."

At about the same time, the company received notice from the owners of Twitchell Island, that their lands were sufficiently dry without further ditching. Thereupon, and in consequence of said editorial and notification, and at the request of Mr. Roberts, the undersigned were appointed a committee to examine and report upon the machine before its removal from the Island, and to make such suggestions as we might deem conducive to the welfare and success of the company.

Having obtained permission from the owners of the Island to run the machine for a short distance, we went there for the purpose of seeing it in actual operation.

We found the machine in ground of the most unfavorable description, consisting of a perfect net-work or matting of coarse, tough grass-roots, of unknown depth, but of undiminished toughness six feet from the surface. We learned from gentlemen of extensive experience in tule reclamation, that no more unfavorable ground could anywhere be found in the tule except in places covered with brushwood or timber, where it was never designed to operate the machine. This is the uniform testimony of persons of experience in the matter consulted by your committee, and accords with the personal knowledge of a portion of the committee familiar with nearly all the reclamation work in the State. The machine is so geared that each bucket cuts one inch in advance the whole width and depth of the ditch. Upon the side of each bucket, knives are so arranged as to cut this slice into narrow ribbons or strips. A slice (cut by one of the buckets from which the dividing knives had been removed) one

inch thick, six feet long, and about four feet wide, was raised by the edge without breaking, by one of your committee, which sufficiently illustrates the toughness of the ground. This slice presented very much the appearance of a heavy, wet door-mat or rug. Under circumstances so unfavorable, the machine ran an average of three feet five and one-seventh inches per minute, cutting a ditch six feet wide and four feet deep, depositing the dirt in an embankment some distance from the side of the ditch, and leaving it in a firmer and more compact form than that of the adjacent levee constructed by hand labor, and consolidated by the settling of more than a year; showing that levees constructed by the machine will be capable of greater resistance to the action of water, and much more valuable than those constructed by hand. The cutting apparatus is adjustable so as to cut a greater or less depth, and by repeating the cut any desired width may be given to the ditch, and any desired elevation to the embankment. The machine was originally much stronger than our heretofore constructed by Mr. Roberts, four of which have been put into successful operation, but when first put up, it proved inadequate for such heavy work, and constant breakage attended each firing up, until the requirements of the case were gradually ascertained and provided for; and the machine, as it now stands, is a fitting monument to the energy and perseverance of the inventor. Nevertheless, the experience of the past summer and the present workings of the machine have suggested to the inventor certain alterations and improvements, which your committee regard as of the utmost importance. They will cost from one to two thousand dollars, and, it is confidently believed, will more than double the working capacity of the machine. We therefore recommend that a portion of the unsold capital stock be disposed of for this purpose at double the original price,* and that when this has been done, that no more stock be sold except to the men employed by Mr. Roberts, who are anxious to receive stock instead of cash in payment for their labor; and that any further expenditures for machines, peat beds, etc., be met from the earnings of the machine. We also recommend the Trustees to advertise for contracts, and in view of the early income reasonably to be expected from the earnings of the machine, we recommend that steps be taken to secure desirable peat beds and to construct peat machines to be put in operation as early next spring as the weather will permit, believing this, the legitimate business of the company, to promise even better results and profits than that of ditching and diking.

A. B. BOWERS, C. E.
H. J. FAINE,
E. R. HAWLEY.

San Francisco, Nov. 25, 1870.

*This recommendation arose from a misunderstanding on the part of the committee. The capital stock can be disposed of only at par, payable in instalments, no one of which shall exceed five per cent. on the par value; and no second instalment can be called for until the whole stock has paid the first five per cent. A large portion of the stock now offered has already been engaged by the purchasers of the first stock sold.

SALT LAKE EXCHANGE.—We are indebted to Mr. B. Fabian, Secretary of the institution, for a copy of the by-laws of the Salt Lake Exchange and Reading Rooms. The object of the Association are those of News and Reading Rooms, receiving the latest despatches and news, providing periodicals and other publications, collecting ores, etc., and adopting other measures and resources for the benefit of the community. To visitors the institution will prove a very pleasant place of resort, and to residents a most valuable one.

STOOD THE TEST.—Passing by the California Tool Works, on Beale street, our attention was called by Mr. Weichhart, the proprietor, to a fire-proof safe blackened and damaged on the outside, but well preserved internally. We were informed that this safe was owned by Messrs. Miller & Haley, and had preserved their books and papers in good order during the great fire on Fremont street, last October. The safe was built by Mr. Weichhart, at his works in this city.

OAKLAND is to have a foundry.

Patents and Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING NOVEMBER 22d.

ROPE HOLDER.—Cornelius Weygant Huson, French Corral, Cal.

SEWING THIMBLE.—Albert H. Law, San Francisco, Cal.

HALTER FOR HORSES.—Augustus Le Plongeon, San Francisco, Cal.

GENERATING GAS FROM HYDRO-CARBONS.—James R. Smedburg, San Francisco, Cal.

DEVICE FOR EXHIBITING PHOTOGRAPHIC PICTURES.—Albert G. Walton, San Francisco, Cal.

APPARATUS FOR COLLECTING PRECIOUS METALS.—James T. McDougall, San Francisco, Cal.

YERBA SANTA.—A. McDermott, Oroville, and Redington, Hostetter & Co., San Francisco, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

STAMP BATTERY.—F. D. Crocker, Virginia City, Nevada. Hitherto the common stamp battery has enjoyed a higher reputation among mill-men than any other. There have been very many improvements made in the details of construction, which are very evident from an inspection of those made a number of years ago, and those now turned out by our foundries. But the general features, the form, manner of raising the stamps etc., remains about the same. Mr. Crocker, however, after studying this matter in its practical bearings for years, and after having held positions which gave him the best opportunities for viewing the subject in all its bearings, has adopted an entirely new style of stamp. His method consists, briefly described, in constructing his stamps so that they can be operated on the principle of the trip-hammer. Tappets on a horizontal cam-shaft in their revolutions strike, and depress, the short arms of levers, thus raising the stamps attached to the end of the long arms; and as these tappets leave the lever arm, the weight of the stamps causes these last to fall on and crush the ore. The force of the blow is increased by springs which tend to throw up the short lever-arms, under whose extremities they are placed. Thus is obtained, it is claimed, a greater crushing capacity with the important item of a less expenditure of power, than is accomplished in the usual methods.

HYDRAULIC NOZZLE.—T. Watson, Nevada City, Cal. The improvement in hydraulic mining is partly due to improved apparatus and is partly the cause of the improvement of such apparatus. The latest device in this direction is the invention here spoken of. The claims here are two in number, viz: the improved manner in uniting the two sections of a hall and socket joint so that the pressure of the water will tend to separate rather than close the joints; and the devices here used for retaining these sections in position. The arrangement is such that the pressure is transferred from the joint to slides, and to an inverted plane on which the slides move, and the invention has been highly praised by a number of parties who have tested it. The nozzle is manufactured by the Nevada Foundry.

SHOE FASTENING.—H. T. Lee, Marysville Cal. Those who are fond of getting up estimated statistics, may, perhaps, derive some amusement from calculating the amount of time annually lost in tying shoe-strings, and the amount of power wasted in uttering expletives when these strings break, as they will persist in doing at just the wrong moment. They can then possibly express, in hours and foot-pounds, the gun which would inure to the world if Mr. Lee's invention were universally adopted. This invention consists in riveting to one leaf of the shoe (over the instep) a set of spring studs, which are forced into corresponding eyelet holes in the overlapping leaf, and which thus hold the two leaves firmly together. The device is most simple and ingenious, and we recommend it to the attention not only of lovers of computed statistics, but also to those of a more purely practical turn of mind,—to the attention, in short, of everybody.

The Electric Probe.

We have previously alluded to an ingenious method, invented by M. Trouvé, of Paris, to discover the locality of a bullet or other metallic substance in a wound,—often a matter of considerable difficulty. The *Am. Artisan* having illustrated the apparatus, we make use of the figures and matter in the present article.

Employing electricity in this way had been previously tried by Prof. Favre, of Marseilles, but not always with satisfactory

results. M. Trouvé then took up the matter, and is said to have rendered it capable of practical use. He bases his method on the principle that when water is subjected to a current sufficient to decompose it, it will not move the indicator of an induction apparatus, as it will not constitute a sufficiently good conductor.

Fig. 3.

The probe consists of two stylets of steel, silver, or platina, that are varnished to insulate them from each other, and are enclosed in a silver case so arranged as to permit only their points to project, and which is itself furnished with a pipe resembling the nozzle of a syringe. The two stylets are in communication with the poles of a battery of sulphate of mercury, so that the circuit is formed whenever a metallic conductor is interposed and in contact with the two points of the stylets. This sets in motion the indicator, which is so arranged in connection with suitable mechanism as to sound or make an audible noise when thus acted upon. As the indicator is inclosed only by glass so that it may be seen, there are three distinct indications given when the bullet or the like is touched, viz: that given by the sense of touch and those afforded by the indicator to the eye and ear.

The pile or battery employed is shown in Fig. 3. The casing is made of hard rubber

lined with carbon. The zinc element is suspended in the top of this case, and is of such length that when the battery is in a vertical position, as when not in use, the zinc will be kept out of contact with the exciting liquid. This latter consists of bisulphate of mercury dissolved in four or five times its weight of water. When the apparatus is to be put in operation, the case is simply laid in a horizontal position, which, by bringing the liquid in contact with the zinc, produces the requisite current.

In order to avoid the non-working of the device, which in some cases might result from the oxydation of the surface of the bullet or other body, or the interposition between the same and the stylets of muscular or other tissue, either of which would act as a non-conductor, the points of the stylets are made sufficiently sharp to pierce such interposing material, and thereby secure the completion of the circuit and consequently the operation of the probe. In some instances, where the wounds are of a sinuous character, the stylets are made flexible and inclosed within an india-rubber instead of a metallic sheath.

The engravings, as well as the description, are taken from our excellent French contemporary, *La Propagation Industrielle*.

The Berthon Log.

One of the most interesting of the varied apparatus for measuring the velocity of ships is the Berthon Log, a device which is said to have successfully stood the test of twenty years' hard service, which is different from all other means employed, and which involves a unique application of obscure scientific principles.

In its earliest form, this consisted essentially in a small tube, passed through the keel of the ship at or about midship. At a distance of a few inches from the keel a small aperture is made in one side of this tube. The tube is carried up into the captain's cabin, or any other convenient place; there it is turned over and united to one leg of a siphon tube inverted, and containing mercury. A motion of about $1\frac{3}{4}$ inches in the column of water will cause a motion of about 1 inch in the column of mercury. When the ship goes ahead, the water forces its way into the tube, and affects the gauge, marking the speed of the ship as in the former case; and through this

scale could be set to this, and then, on the pipe being returned to bring the side aperture ahead, a correct reading would be at once obtained of the speed of the ship. It was concluded that the neutral position would be that in which the aperture was turned exactly at right angles to the keel of the ship.

In actual trial, however, the following results occurred: "With the aperture directly ahead, the column of mercury actuated by the column of water stands 4 inches above zero. When the aperture is turned directly astern, the column of mercury falls 2 inches below zero, or 6 inches lower than when the tube is in the first position. When the aperture is turned to the side, that is to say, into just the position where we would expect to find the motion of the ship powerless to affect the height of the column of mercury, there is absolutely the maximum effect produced, the column being lowered not less than 6 inches below zero, or 10 inches lower than when the aperture is right ahead. But the most extraordinary circumstance of all is that the zero angle is apparently constant for all circular tubes, and all shapes of aperture and all speeds, being invariably 41 deg. 30 min."

Why this is so is a subject for discussion, and to illustrate the nature of the problem *The Engineer* has published the engraving which we have here transferred from the *American Artisan*, and invites consideration upon several points in the following language:—"Why should the figures given bear to each other the relation of 2, 4, 6? Why should the action be more powerful while the orifice is turned abreast of the current than in any other direction? And why should the angle of 41 deg. 30 min. be the zero position? Those who address themselves to these excessively interesting questions—questions which are intimately connected with the laws of induced currents—will do well to bear in mind that the laws we have laid down are stated to have been ascertained and confirmed by many thousand experiments conducted on board Channel steamers and her Majesty's ship *Danvers*. They are not the result of theoretical deduction, but of practical tests. We are not aware that any attempt to explain the relations existing between a column of water within a tube and an outside current—communication being established by suitable orifices—has ever been made; but we think these relations deserve the attention of those interested in ejection-condensers, injectors, induced-current dredgers, hydraulic propulsion, etc."

MONTANA MINERALS.—The following is from the *Missionary Pioneer*, in reference to the existence of quicksilver in the Coeur d'Alene mountains, and is of interest, but we wish the paper had not added the assertion of Gen. Meagher, which is about the tallest story we have met with lately: Father De Smeth, whose name is familiar to most of our readers, seemed to be positive, at the time the assertion was made, of the existence of cinnabar, in the Coeur d'Alene mountains; and Lieutenant Lander, while passing through the same mountains, found cinnabar croppings, and located the precise spot on a map. Researches made afterwards, by parties now in Missoula, were without result; but as Lieutenant Lander is well known as a scientific man, and a mistake with him not likely to occur, we hope that future investigations will prove more successful. In the year 1866, General Thomas Francis Meagher traveled through the Coeur d'Alene mountains, and on his return assured us that he had seen great quantities of lead ore (galena), and some places where even the mountain sides were covered with metallic lead, which the reducing blast of forest fires had produced from the outcroppings.

A RICH PLACER.—According to the *New Northwest*, Pilgrim Bar, Montana, has yielded during the season \$100,000 to Roe, Beery & Co.; \$45,000, upper ground, and \$85,000, lower ground, to Catching, Kohrs & Co.; \$20,000 to Timberlake, Hagan & Co.; and \$75,000 to other parties; making a grand total of \$342,000. The paper adds: The lower Bar, where mining has been vigorously done for the past two years, is not over one-fourth worked, while Gold Hill (upper bar) is yet practically unopened. It is believed to be fully as good as the lower bar. There are therefore good diggings for the next six years.

THE DEEPEST excavation in the United States is a copper mine near Lake Superior. It is 1,300 feet deep.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market Street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warerooms and inspect our stock.

GEORGE E. PHELAN.

BANCROFT'S NEW MAP
OF THE
PACIFIC STATES

California, Oregon, Washington, Idaho, Montana, Nevada, Utah, Arizona, British Columbia and Alaska.

Elegantly engraved on copper and colored in counties. Fifth edition, thoroughly revised and brought down to date 1870. It shows the great Overland Railroad, also the proposed Northern and Southern Pacific Railroads and their connections; also all Railroads completed and projected in California and Oregon.

Upon the same sheet, on a less scale are the maps of Alaska, and a complete Railroad map of the United States.

No other map can compare with this edition in fullness of detail, and beauty and accuracy of its topography.

An enterprise of such magnitude and importance as this large and elegant copper-plato map, in order to be properly appreciated, should be in every office, school-house and dwelling. Those wishing an agency should apply immediately for terms, to

Longshores Combination Tool.

own on this Pacific Coast to sell this valuable little implement. Retail price fifty cents.

Simonds Patent Collar Stud.

Every one who wears a "Butterfly" tie, knows well the vexatious incident to fastening the loop of these ties over the common collar stud or shirt buttons. This stud while serving every purpose of the common article makes this task as easy as hanging ones hat on a nail. The loop slides readily into the slotted hub, and cannot escape by accident, thus preventing the loss of the tie; now so common. They are well plated with gold. It is very seldom that a patent is offered which affords a larger profit than this one. Parties buying the right to a town, county or state, will be furnished with the studs at what they cost to manufacture. A sample will be sent to any one by mail, on the receipt of the retail price, fifty cents.

Improved Construction of Roofs for Tobacco and Fruit Drying Houses.

Persons who are interested in the drying of fruit or tobacco, can fully appreciate this new and useful invention. The object of the invention is to construct the two inclined sides of the roof of a Tobacco or fruit-drying house, so that the sides can be readily and quickly thrown into a vertical position, so as to expose the fruit or tobacco to the drying effects of the sun and air. By the use of this simple device, the labor and expense of handling the tobacco leaves, and changing them upon the racks, is avoided. In California and Oregon, this invention can be used to great advantage in fruit drying. In time of rain the sides of this roof can be almost instantly lowered to protect the fruit from dampness. This invention has been recently patented by M. de K. Cutts, of Richmond Va., and a full set of drawings, and Letters Patent, can be seen at our office. Here is an opportunity for a profitable investment, as we are authorized to dispose of Rights at very low prices. Full particulars can be obtained from any of our travelling agents, or by calling at our office.

NEW HOSE COUPLING.

This coupling is one of the most useful and perfect inventions of the day. It can be joined almost instantaneously and answers equally well for gas or water hose. Call and examine samples. The Right, to any town or city on the coast, will be sold at a reasonable price.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

Mechanic Arts College Lectures.

Prof. Le Conte, in his third lecture, commenced with an eloquent introduction concerning the relations and dependencies of sciences, and their method of progression from the simple to the complex, showing the application of his remarks to the reconstruction of the coal flora in its fullness from the broken fragments presented to the geologist. He then turned more directly to the subject for the evening.

The Flora of Coal.

Of the 2,000 species of terrestrial plants known, about 700 are found in the coal measures. These are found as fronds, as trunks or fragments of trunks, often flattened out as thin as one's hand, between the black shale and the coal seams; often as stumps with bark blackened and turned to coal and the inside filled with what was once mud, now hardened to stone; often as roots in the clay below. In the black slate or roof above, leaves of ferns and other plants are found, frequently perfectly preserved, but often requiring a close examination to detect them, as the black lines in the black rock are not very conspicuous. But when the shale is gray, the black lines are clear and form most beautiful objects. We find these in great numbers, of large size and grotesque forms, as shown in the diagrams (which hung on the walls of the hall).

To give an idea of how nature has progressed always according to immutable laws, and to correct the impression existing among many that the coal period was merely a time of natural irregularities and monstrosities, it is necessary to enter into some of the details of the

Classification of Plants.

The following table gives a view at a glance of the classification of plants:

Plants	Phanogams	Angiosperms	{ Dicotyledons or Exogens Monocotyledons or Endogens
		Gymnosperms	{ Conifers Cycads
	Cryptogams	Vascular Cryptogams	{ Ferns Club mosses Equisets
		Cellular Cryptogams	{ Mosses Lichens Fungi Sea Weeds

The first division is into Phænogams and Cryptogams, or flowering and flowerless, or seed-bearing and spore-bearing plants. There is a great difference between a *spore* and a *seed*. Every one is familiar with the common "puff-ball," which, on being pressed, throws out a cloud of dust. This dust is composed of minute *spores*, or microscopic cells, each of which has the power of reproducing others. But the seed consists not of a single cell, but of thousands of cells aggregated into organs, and each seed contains all the organs of the grown plant, which require only development, not reproduction.

Cryptogams are divided into cellular cryptogams, which consist entirely of cellular tissue, or tissue which when cut shows under the microscope a collection of little cells, and into vascular cryptogams, which consist principally of long tubes, beautifully marked. Phænogams are divided into gymnosperms or naked-seeded plants, where the seeds have no protection, no pods; and angiosperms or covered-seeded plants, where the seeds are inclosed and protected in pods. Angiosperms, again, are divided into dicotyledons, where the embryo has two cotyledons or seed leaves (as the common forest trees); and into monocotyledons, with only one seed-leaf (as palms, bananas, corn).

Determining Fossil Plants.

Now, it will occur to one that this method of classification will not do for fossil plants, where, for instance, we have only a fragment of a trunk. We have here no seed or spore to tell us whether it is a phænogam or a cryptogam, etc. How can we then determine the class to which a specimen belongs? In two ways:—from the structure of the stem, and from the venation, or arrangement of veins, in the leaves.

STRUCTURE OF THE STEM.—Three kinds of tissue can be distinguished in plants:—the cellular, composed of little cells, more or less spherical or polygonal; the vascular, with long tubes, running generally in the direction of the length of the plant and marked with lines or spots; and the woody, consisting of small tubes with thick walls so as to be almost solid. Fig. 1 shows all three kinds, denoted respectively by a, b and c, this figure showing likewise how the three occur in a common hard-wood tree of the exogenous kind.

Now it has been found, as before remarked in part, that cellular cryptogams consist of cellular tissue, and vascular cryptogams principally of vascular, with a little cellular, tissue. In the other plants, the woody tissue predominates.

But in dicotyledons (every one has seen this in the case of common trees), a cross section shows always three parts: pith, wood and bark. Again, the wood shows concentric rings, defining the separate layers of wood, formed outside of the preceding, each year that the tree lives (hence the name "exogens," or outside-grow-

ing); it shows also radiating lines (of cellular tissue) extending from the pith to the bark, called pith-rays or medullary rays. From this we can always tell a dicotyledon from other kinds of plants.

A monocotyledon is distinguished, although like the preceding it has all three tissues, from the fact that it has no distinct pith, wood and bark, no concentric rings, no rays; but it has threads of wood distributed throughout the vascular tissue, without any particular order.

Lastly, we find that the gymnosperms have a peculiar tissue. This resembles very much that of the dicotyledons, so much that they are often classed with these. But a distinctive mark is found in the disks which we can see distinctly marked on a longitudinal section. Fig. 11. illustrates this.

VENATION OF THE LEAF.—We have here also three kinds: the reticulated, where from one rib, running along the middle line of the leaf, veins branch off at various points, and from these last, smaller ones run (as in our ordinary hard wood trees); the parallel-veined, where the frame-work consists of slender ribs or veins running nearly parallel with one another from the base to the point of the leaf without dividing or forming meshes (as above), except very minute veinlets (as in corn, grass, etc.); and radiated, where the veins branch off from three to nine ribs, which radiate from the top of the leaf-stalk. Now we find our various classes of plants characterized by the venation of the leaves, as follows:

Cellular cryptogams have no venation. Vascular cryptogams have the radiated venation (as ferns). Of angiosperms, the leaves of the monocotyledons are all parallel veined; those of the dicotyledons are reticulated. In gymnosperms it is rare that we can trace the venation, the leaves are so narrow; but some of the conifers (cone-bearers) which have quite broad leaves, show a radiated venation.

In regard to the gymnosperms, it may be well to say a word or two here, as they are examples of what are called *connecting types*, of which more will be said hereafter. They form a connecting link between higher and lower orders of plants. They are related to the highest, the dicotyledons, in the stem structure, as shown by the distinctness of pith, wood and bark; by the manner of growth indicated by the concentric rings; and by the medullary rays. But they differ in their tissue, which is related to the lower orders, is midway between the true vascular and the woody tissues. They are allied in the lower orders in their naked seeds; for protecting the seeds, like taking care of the young, is a characteristic of the delicacy and complexity of organization. In the venation of the leaves they resemble the lower vascular cryptogams. Hence we place them, not with the dicotyledons in the highest place, as many have done, but below, in the intermediate position in which they belong.

Plants of Coal.

The coal plants belong generally to the five principal families of Ferns, Pines, Lepidodendrids, Sigillariids and Calamites.

Of all these, the ferns occur in the greatest profusion. In the English coal beds alone, 250 to 300 species are found, a larger number than now grow on the British Isles. We distinguish them by the large fronds, the peculiar venation of the leaves and, in the case of tree ferns, (for they often grew up into veritable trees) by the large irregular marks on the trunks, the scars left where the fronds were attached. Ferns have certain characteristics alluding them to higher orders (conifers).

Pines are found as logs which have been drifted on the waters and imbedded in (what is now) the sandstones above the coal seams. Pines grew on the highlands of the carboniferous period. Their fruit is also found. This tree differs from our common pine but is nearly related to certain broad leaved varieties called the Araucariae. They almost always had a very large pith, while the present common pine has a very small one.

While the ferns formed the thick underbrush and the pines the highland plants of the period, the other three families were the huge swamp trees which, by their great number and size, contributed more than all others to form the actual coal seams. And these families were entirely different from any now found.

The Lepidodendrids, "scaly trees," grew up to 4 or 5 feet in diameter, and 40, 50 and 60 feet high. Their trunks were covered with rhomboidal, scale-like markings (whence the name) where the leaves fell off, branched sparingly and had hairy arms with scales, as of the club-mosses, and terminating in club-like shapes. These ends were not cones, as has been thought, but bare spores. The trunks have a ring, a mass of cellular tissue, then bundles of vascular tissue, no wood fibre, but a central pith. They are therefore a connecting type, related to

the higher pines and to the lower mosses.

The Sigillariids grew in tall columns, sometimes with a few large cylindrical branches, sometimes with none, 5 to 6 feet in diameter, 70 to 100 feet high, fluted or grooved from top to bottom, and marked between the grooves with seal-like impressions (whence the name, from *Sigillum*, a seal), in regular rows. Their tops were clothed with long narrow leaves (as in the Lepidodendroids). Their roots, which have been wrongly taken to form a separate class, the Stigmariæ, were large, spread out in all directions, and covered an immense area with their small rootlets, being adapted to hold the tree firmly in the loose swampy soil. In the internal structure they show a great mass of cellular tissue, with cylinders running through the center, but divided into wooden wedges. The microscope shows also a true woody tissue. There is but one tree now growing which resembles them, the cycad, or sago-palm as it is wrongly called. The sigillariids are allied then on the one side with the club-mosses and lepidodendroids (from which last indeed, they sometimes cannot be distinguished), and on the other side with the cycads. They are a connecting type.

The Calamites (from *Calamus*, a reed) have long, slender stems, six inches to a foot or more in diameter, jointed, ribbed and hollow, with leaves at every joint like the equisetum. A section shows true woody tissue. This is then another example of a connecting type.

General Picture—Conclusions.

A general picture of the coal period would show us none of our ordinary hard-wood forest trees, no grasses or palms, no flowering plants, but huge sigillariids with fluted columns and hairy-armed lepidodendroids and the like, while the most graceful plant was the fern; we should see no men, no quadrupeds, no birds, no reptiles except a few of the lowest orders, but great grotesque fishes enveloped in a mail of bony armor and a few insects. No flowers or grassy slopes would enchant the eye, no song of birds charm the ear, no fragrance perfume the air; only the wild wilderness without voice and almost without sound.

The most important philosophical conclusion to be drawn is that all our coal plants are connecting types of classes now entirely different. And this is shown to be general in all things. Nature never introduces at first a typical feature, but always a connecting type. The first fishes were reptilian fishes, often hardly to be distinguished from reptiles. The first great Samarian reptiles were monsters allied to birds and mammals. We find reptiles with two legs and birds with jointed tails. And numberless other examples could be given. Thus nature expresses her thoughts at first in general terms, and afterwards amplifies; first draws the outlines and then fills in the details.

The lecturer proceeded to develop more fully and to illustrate this subject of the universal law of development, the law of differentiation, of increasing difference, of growing diversity. He showed how in the history of animals, of plants, of human society, the first forms were simple and representative of many, and how afterwards there was a gradual process of development and division, leading to greater perfection and to organic unity. Thus, for instance, at first the same temperature prevailed over the whole globe. Gradually the climates of different localities have been changing until the greatest diversity now exists; while such is the unity of the whole that the climate of no one place can be varied without producing a corresponding change in that of all others.

Life Insurance.

During the last quarter of a century, and more especially during the last ten years, the development of life insurance in our country has been wonderfully great. Its growth has been so rapid and so healthy, that this fact alone attests to its beneficial action and to the intelligence of our people. Our excellent cotemporary, the *Technologist*, has given a few figures illustrating the progress made during the last decade in New York. It appears that, in 1859, there were but eight life companies incorporated under the laws of New York; now there are thirty-five. Six companies from other States were then, and twenty-four are now, transacting business there. The gross assets of the New York Companies were \$12,090,815; premiums received, \$2,013,376; losses paid, \$3,591,426; for 1859. In 1868 these were, respectively, \$89,063,961; \$35,691,951; and \$5,553,840. A brief biennial table, compiled from the Massachusetts department reports, gives a view of the growth throughout the Union, among the sound companies making annual returns. The table (which, it should be stated, does not represent a considerable number of companies which do not report at the East) gives the number of companies in 1858 as 14, in 1868, 56; the number of outstanding policies in 1858 as 42,502, in 1868, 548,280; the amount insured in 1858 as \$116,482,156, in 1868, \$1,566,901,509.

These numbers show an astonishing growth. But when we consider the great anxiety of men, exposed so often in our country to great vicissitudes of business, for the future welfare of those dependent on them, and the loss of peace of mind (resulting in diminution of power) occasioned by such anxiety, we can no longer wonder at this growth, nor be blind to the beneficial effect exercised by life insurance. A man who knows that his dearest ones have nothing to fear from want to come, can work with redoubled power. Life insurance, says the journal spoken of above, must be regarded as adding to the wealth of a community, and consequently to the wealth of an individual, to an extent greater than that of stored up treasures; it adds during long years to our power of attaining wealth, and consequently to our wealth itself. It has been said with truth that he who has a family has given hostages to fortune; it may be said with equal truth that he who has effected an insurance on his life has taken hostages from fate.

In California life insurance has had a growth more remarkable, we are tempted to say, than in most any other place. Indeed, there has been some trouble in overdoing the thing, and several companies have come to grief; not so many, however, comparatively as in other branches of business. This fact does not militate at all against the system nor against its benefits, which are undeniable. It only serves as a warning to insure in sound companies.

A reference to our advertising columns will show the strong points of a good company, the Connecticut Mutual Life Insurance. This a *purely mutual*. There are no stockholders, to absorb any part of its funds, and its surplus of \$10,000,000 belongs wholly to its members. Its management appears to have conducted its business at a lower average of expenses than any other, the ratio of expense to total income for the last year being only 8.89. It seeks no loose business, is careful in the selection of lives, invests with intelligence, at the highest rates of interest that can be obtained consistent with security, and not in fancy stocks. A long experience and careful management result in the greatest benefits to those who insure in it, and it announces dividends amounting to \$2,300,000 for 1870, and a total amount insured of over \$177,000,000.

LIGHTNING IN A CHURCH.—During the severe thunderstorm which prevailed on Thursday, the Universalist Church at Mount Vernon, Westchester county, was struck by lightning, which, in addition to the damage inflicted, shook the structure to its foundation. The electric substance first came in contact with the wooden spire, instantly stripping its exterior and scattering the debris in every direction. Descending into the edifice, marking a path of destruction, the fiery element crashed through the floor into the basement, and escaping through the granite foundation rolled upon the ground outside for a short distance, and then exploded with a tremendous report. Its appearance, before exploding, as seen by a couple of citizens, resembled a ball of fire about the size of a hen's egg, and when bursting emitted a shower of sparks which impregnated the surrounding atmosphere with a sulphurous odor. The occurrence caused quite a panic in the neighborhood.—*N. Y. Herald.*

AN EASTERN BANKER, whose name is very familiar to the public, in early life resolved to take the Patriarch Jacob's pledge, "Of all thou shalt give unto me, I will surely give the tenth unto Thee." He directed his clerk to open an account with O. P. J. (Old Patriarch Jacob), and to credit it one-tenth of all the commissions that came into the office. For years this banker has been one of the largest operators in the country, and the thousands placed to the credit of O. P. J. have been faithfully applied to benevolent and charitable objects.

LADY—A telegram from Havana, of the 25th, announces the successful laying of the cable between Aspinwall and Jamaica.

A NEW PAPER FOR 1871.

—THE—

PACIFIC RURAL
PRESS.

A First Class Pacific States Agricultural and Home Journal.

Will be issued weekly on Saturdays, commencing Jan. 7th, 1871, containing sixteen pages devoted to

Agriculture, Horticulture, Stock Raising, Domestic Economy, Home Manufactures, Mechanics, Industries, etc.

With an able and ample corps of editors, special contributors and correspondents, we shall publish a liberal variety of articles, entertaining as well as instructive, which will not only make the RURAL PRESS an able assistant to its patrons, but an attractive and welcome visitor to every reader in every intelligent

Home Circle,

in the Pacific States. And more than this, we shall freight its columns with fresh thoughts, and new ideas, which hastened across the continent by rail, shall awaken and quicken the zeal of the more staid and gradual moving culturists of the eastern and European States, to their

Pleasure and Profit.

We shall not only make a good paper for all husbandmen and homestead owners, (who now, more than ever require a knowledge of new discoveries in science and mechanical improvements,) but shall also render the journal a desideratum for those who contemplate becoming freeholders, and a large class of

Mechanics, Teachers, Students, Business, Professional and Trades Men,

whose interests are more or less identical with successful farming, and the active development of our vast and rich resources. Few there are—male or female—who will not find pleasure and enlightenment in the study of progressive farming and gardening.

Honest, intelligent and correct information will be faithfully given, in behalf of, and urging

An improved Cultivation of the Soil;
A greater Diversity of Products;
Better Breeds of Stock;
Better Varieties of Fruits;
The Culture of New Products;
Creation of New Home Industries;
Adoption of Improved Implements;
Higher and Happier Aims in Life, etc.

Valuable and Timely Hints,

will be given weekly to lessen the labors of the farm, the household and the shop, and add to the health, the wealth and the wisdom of every patron of industry.

How to Farm in the Pacific States.

As the conditions and circumstances of soil and climate and seasons on this coast are so peculiar that many of the approved methods of eastern agriculture are not at all applicable on our side of the Continent,—special attention will be given to considering the need, extent and character of the modifications necessary. This will alone render the paper of great practical value to our home readers and more essential to them than all the distant publications obtainable, without such auxiliary and modifying instructions.

The following are among the specialties upon which the PACIFIC RURAL PRESS will treat:

Silk, Cotton and Sugar Beet Culture; Nurseries, Orchards, Tropical and small Fruits; Steam-plowing, seeding and harvesting for large tracts; Reclamation of swamp and unproductive lands; Hill and mountain farming; Grape growing; Fig, Raisin and Fruit drying; Irrigation; Lessons and Lectures on the chemistry of growing crops and on fertilizing lands; Practical Farming vs. Speculation; Taxation of unimproved lands; Railroads and improved transportation for crops and the better class of immigrants; Farmer's Clubs, lectures and associations; Co-operation in farming, mechanism, manufacturing and other industries; Government lands for settlers whether sold by R. R. operators or the U. S.; Reliable wholesale and retail market reports; Brief notices of Mechanical and Scientific Progress; Instructions for regular and farmer mechanics; Household Reading; Health and domestic receipts; a sprinkling of sprightly reading; Life thoughts; Poetry, condensed stories, items of news, etc., will be given.

A Plain and Simple Style

Of writing will be our endeavor. Necessarily dealing largely in researches for facts we believe it desirable to present them in an inviting shape and in so comprehensive language that our special journalism shall advance in popularity and common relish.

No editorials or selections of unchaste or doubtful influence; or lottery, quack or other disreputable advertisements, will be admitted into its columns.

Arrangement of Matter.

Our reports of agricultural, horticultural and other fairs, lectures, farmers' clubs and social literary meetings [the improvement and increase of which we shall especially advocate] will be carefully prepared in a valuable form for preservation; and the matter of our entire columns will be so classified as to be convenient to readers of various minds and individual tastes for ready perusal and future reference.

Interesting Illustrations of Pacific States and Eastern Inventions and Machinery, Fine Arts, Science, Fruits, Rare Stock and Natural Scenery,

Of special or peculiar interest to our readers will be published weekly in liberal variety. No pains or reasonable expense will be spared to furnish a

Large and Richly Filled Journal

Nicely printed on fine paper, which will favorably compare with the long established class journals of more populous fields and older communities. Although the latter have less opportunities than new communities to be benefited by printed information of discoveries,

And Neighborly Experiences,

the reading of agricultural newspapers and books is lately increasing with a rapidity quite astonishing, and with the most profitable results.

We enter the field after a careful consideration and consultation with many of our leading agriculturists, with the strong conviction that such a journal on this coast is greatly needed and earnestly desired by the most prospectively flourishing and rapidly progressing community in the Union if not in the world. We know the task before us,—two of the proprietors and editors having experienced respectively 18 and 13 years of successful journalism in this state.

Five Thousand Subscribers.

We shall print 5,000 copies of the issue of January 7th. That is the number of subscribers we hope to start with, having half that list already.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where you can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Bookkeepers. This school is connected with the International Business College Association, or Bryant & Stratton chain. Its scholars are good for tuition in any of the forty colleges located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 23v22 3mb

FROM ALEX. N. DOUGHERTY, M. D., late of the Medical Directors U. S. A., Newark, N. J. "Having been made acquainted with the composition of the preparation known as SOZONOR, I have some time past permitted its use in my family, where it has given entire satisfaction. It is an elegant toilet article well worthy of the encomiums it has received."

"SPAUDINO'S PREPARED GLUE."

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, OR ENAMELED CARDS, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 23 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 0v15 6m B. F. HOWLAND.

BLOK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Orty, 437 Brannan street. 7v11 3m

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 St. Vedron street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your journal is very valuable. No better investment for \$4. Respt. B. C. B.

ROSE PEARL AND PROLYLINE.—A new base and gum superior to any other material in use for artificial teeth. I have recently introduced it in my practice. Call and examine it at my office, 235 Bush street. H. J. PAINE, Dentist.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

DEWELL'S COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma, they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers' Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills Brick Lane, London. 6v20-17

Patents Obtained Promptly. Caveats Filed Expeditiously. Patent Reissues Taken Out. Patents Secured in Foreign Lands. Assignments Made and Recorded in Legal Form. Copies of Patents and Assignments Procured. Examinations of Patents made here and at Washington.

DEWEY & CO.,

Publishers and Patent Agents, No. 414 Clay street below Sansome, San Francisco.

THE PRESS is just such a journal as the people of this valley should patronize—it ought to go to every residence. It is devoted to the agricultural and mining interests, mechanic arts and general industrial progress. The subscription price is \$4, which, considering that the PRESS is one of the largest and ablest journals of its class in the Union, we consider very reasonable.—Every business man of Bozeman, will we are satisfied, give Mr. Murray his name, and we hope such of our country friends as he interviews will be equally liberal. PICK & FLOW, MONTANA.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

SCIENTIFIC PRESS.—three numbers—terms \$4 per annum.—San Francisco. Constant improvements are being made in this publication. Illustrated machinery devoted liberal attention. Of late, an edition exclusively devoted to agricultural matters is issued simultaneously with that devoted to mining and scientific affairs generally. The growth of the paper and multiplicity of subjects embraced in the table of contents give evidence of an increased patronage and a corresponding industry to maintain its high character.—*Colorado Herald.*

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentee, WIRTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 23d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first class FARMING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

REAPER AND MOWER SECTIONS, BARS

AND ALL KINDS COMPLETE.

At a saving of 50 per cent. New Files of every description on hand and made to order. Old Files re-cut, and warranted equal to new. Orders from the country promptly attended to. 4v19-qy

McAFEE, SPIERS & CO.,
BOILER MAKERS'S
AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, and put new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making Drawings of their Inventions, giving them the benefit of their practical knowledge of the construction of Machinery, and attending to the manufacture and introduction of their Inventions. 1v161f

GOLDEN CHARIOT MINING COMPANY,
SILVER CITY, IDAHO TER., Oct. 18, 1870.Messrs. Randmann, Nelson & Co., Agents
Giant Powder Co., San Francisco, Cal.

DEAR SIR: In reply to your late favor, I give you the following result of my working here—the cost of drifting, which cost under the old system of mining here, \$40 per foot, with the single hand system of working and Giant Powder I have reduced to a cost of \$22 per foot, and when under the old system but one foot per day was given, my men are easily making one and a half feet.

Under the old system wining (5 feet square) cost \$35 per foot, same is now costing me \$24 75 per foot with the same difference in time as shown in drifting.

Under the old system, our mine could never be made to yield exceeding 400 tons per month; with Giant Powder and single hand drilling, I am now furnishing monthly 1,000 tons at a reduced cost of at least 33½ per cent, less per ton than under the old system.

In conclusion, will state that the neighboring mines Ida Elmore and Oro Fino, influenced by results in the Golden Chariot Mine, have adopted single hand drilling and Giant Powder to the utter exclusion of double hand work, large drills and common blasting powder. In corroboration of results in Golden Chariot Mine, I refer you to the President and Board of Trustees, resident in your city. Yours, respectfully,

JOHN F. CASSELS,
Superintendent G. C. M. CO.

Organ of the Masonic Fraternity on the Pacific Coast.**ENDORSEMENT OF THE GRAND LODGE.**

The following resolution was unanimously adopted by the M. W. Grand Lodge, P. A. M., of the State of California, at its Annual Communication, October, 1870.

Whereas, In the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,

Resolved, That this Grand Lodge, recognizing in the MASONIC MIRROR, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said MASONIC MIRROR to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the MASONIC MIRROR, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The MIRROR presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

Drying Foundry Molds by Hot Air.

Drying molds for castings in the ordinary way by extemporized fires is a method long, costly and imperfect. The heat is transmitted to the mold only by radiation, and very imperfectly, almost always some parts remaining damp while others are burnt. Pieces of cinder and unconsumed fuel often fall into the mold, and the blast employed to remove them is apt to blow away also the edges of the sand. The cost of fuel is considerable, especially when the mold is large and a number of fires is required.

The method of drying by stoves is doubtless more economical, but is also unsatisfactory. If the molds do not fill the drying chamber, the economy of fuel is lost. The molds being placed one above the other, are not exposed to an equal temperature, and the moisture from the upper is constantly precipitated upon the lower ones. Hence some must often be subjected to a second baking. The consequence of this irregularity, especially when the molds are large, is that fragments are apt to break away, a danger augmented by the unavoidable handling. This method, moreover, involves the necessity of flask moulding and the constant removal of heavy weights.

In order to obviate these inconveniences, a valuable method was introduced some time ago in France in the foundries of Rive-de-Gier by the managers, the MM. Brunnon. Through the kindness of our excellent cotemporary, the *American Artisan*, we are enabled to reproduce the description and illustrations of the method as originally given in the *London Engineering*.

From the section, Fig. 1, it will be seen that in a walled pit, D, is placed an iron grate proportioned to the size of the molds which have to be dried. Openings, O, O, are made around the circumference of a cast-iron plate, situated above the grate, as seen in the section, and in Fig. 2, which is a plan of the pit and its plate and openings. An upper plate, H, arranged as shown, covers the grate, and can be removed for the introduction of fuel. When not in operation, the openings, O, are closed by dampers; but when at work they are opened, and give passage to a current of hot air, which is led by means of pipes, L, L, to the center of the mold, and which enters it in the middle, as shown in the section, whence it spreads over the whole of the mold and escapes through the air-openings at the

edges. The passage of the hot air is regulated by a damper placed in each of the openings, O, and by the air-holes, which are stopped readily by a little sand, if desired. A thorough control is thus maintained throughout the arrangement, and there is no possibility of burning or unequally drying the mold. This simple operation can be employed with still greater convenience when a rapid drying is not absolutely necessary. By passing a hot blast into the mold, and then closing the air-opening, the heat is sufficient slowly to dry the sand.

DRYING FOUNDRY MOLDS BY HOT AIR.

It will be seen by Fig. 1 that the fireplace is nothing more than a stove on a small scale, in which the loss of heat is reduced to a minimum, and the supply of warm air variable and entirely under control. The greater portion of the air forced in by the fan envelops the outside of the fireplace, and is heated by contact and radiation. This offers another means of regulating the heat, and at the same time prevents any cinders from being drawn off in the mold through the pipes. The heat moreover, is better applied than in the ordinary drying stove, as the warm air acts equally on every side, and is not obliged to penetrate the whole thickness of a mold before reaching the opposite side.

The system which we describe has been in successful operation in the foundry of MM. Brunnon for more than a year, and has satisfactorily proved its economy in fuel, as well as its advantages in saving of time and reliability of action.

AN OLD LANDMARK GONE.—The winds, on Wednesday morning, destroyed the old telegraph station on Telegraph Hill, the point toward which so many eyes were wont to be directed in our earlier days.

Work at the City Foundries.

The foundries are having another season of comparative quiet, although there is enough work to keep a fair number of men employed. The Pacific Works have a considerable job for the Bazada mine in Mexico. For this they have made the castings for three large water-wheels, for eight German amalgamating barrels, the shafting for a pulverizing mill, the iron work for dump cars, retorts, etc. For the Palmarejo mine, also in Mexico, they are building the pumping machinery, including a Cornish pump,

long. For the San Francisco Refining Works they are making two large evaporating pans, 7 feet long. They are building a 5-stamp mill for White Pine, and a Hepburn roller pan and a large settler for a newly opened mine at Auburn.

The Golden State Iron Works are building a 20-stamp mill for the Oneida company, Amador. In this they introduce a cast iron apron in front of the battery to prevent the water from being splashed around. This is the design of Mr. W. H. Patten, Chief Engineer of the company. Pans, settlers, rock-breaker, etc., are being

made for the Nevada Metallurgical Works, which are about to commence operations in a few days. Messrs. E. N. Riotte and C. Luckhardt, both well known gentlemen, are interested in this new institution. The iron works are also building retorts etc., for the Ida Elmore mine, shafting, pulleys, and casting generally for a flour mill in

Secramento; and a large amount of white-iron castings for California and Washoe. They are receiving quite extensive orders for Stevenson's Mold-Board Pan, which is said to be successfully competing with other pans and to be introduced generally in Washoe where a new pan is put in.

The Risdon Works are busy on various jobs, some of which have been mentioned before. They are now making a large lot of car wheels for the various roads of the State, in which they are driving the Eastern article out of the market.

The Fulton Foundry are engaged on large tunnel drills of the Diamond Drill Co. The machine is made to drive four drills at once. The engines for driving the drills have two 7½-inch cylinders. For driving the 16-inch air compressors there are two 6-inch engines. The works continue to build Brodie crushers, being engaged now on one of small size and one of large size, the latter being for the Sierra Butte M. Co. They have a considerable amount of general work on hand, sufficient to keep their hands busy all the time.

TELEGRAPHIC MONEY ORDERS.—The Western Union Telegraph Co. has inaugurated a new system of telegraphic money orders, extending this to every office on the coast, and then doing the community a great service. The money orders are limited to sums up to \$50. The company is crowded with orders although they commenced on this system only on the 1st inst.

FIG 2

East.

The Vulcan Works have been making some large retorts, 7 feet in diameter and 5 feet high, for the Pacific Wood Preserving Co.; also 10 retorts for the bone-black furnaces of the California Sugar Refinery. They are just finishing a number of columns for the new Mint, and likewise an extensive lot of machinery for the State Prison at San Quentin. They are busily engaged in turning out a large amount of machinery for the San Francisco and Pacific Sugar Refinery, including a large steam engine, 20x30 in., with two air pumps, 20x24 in., and two tubular boilers, 22½ feet long, 6½ feet in diameter, with 77 tubes, 4 inches in diameter and 16 feet

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

All About Montana.

[Continued from page 373.]

Silver Star District.

[We here give the missing letter from Silver Star, to which we alluded last week.—Ens. PRESS.]

Silver Star is located on the Jefferson river, 45 miles from Virginia City and 75 miles from Helena. The town is a small place, has a quartz mill, a few stores, etc.

The mill is that of the EVERETT GREEN CAMPBELL Co., and Mr. T. J. Johns, the foreman, kindly showed me through it. There are 10 stamps, of 650 pounds each, with a drop of 7 inches, working at the rate of 65 drops per minute. Four Horn pans are used. The steam engine is of 33-horse power, and the whole of the machinery is of good quality. The capacity of the mill is 18 tons daily, and they work night and day.

In the mine, the company started their lower tunnel in August, 1869, to penetrate the Wick lode (the east extension of the Green Campbell), at a depth of 104 feet and 500 feet east of the Green-Campbell ground; to be carried along the Wick lode west for the development of the Green-Campbell; and to reach a depth at the main shaft of the latter of over 230 feet. It is in now 550 feet, with as yet no positive development. Work on it is temporarily suspended, to be prosecuted again however, at an early day. A large body of water has already been drained by this tunnel, and still continues in considerable quantity. At one point of Green-Campbell, the lead was some 20 feet wide and its width throughout is from 6 to 15 feet. It displays some exceedingly rich streaks of ore, and when carefully assorted yields a handsome revenue.

The mine certainly promises well and both mine and mill are yielding handsome profits. I see a notice in the PRESS from Mr. Everett, to the effect that he was sorry that the agent of the PRESS did not visit his district. He did call, but the superintendent was away, and he failed to see him.

Iron Rod.

THE IRON ROD LODE is about four miles from Silver Star, and up on a high mountain. The ledge is from 1 to 3 feet wide, runs east and west, and dips 52 deg. to the south. It has a main shaft, 340 feet deep, and five others ranging from 60 to 340 feet in depth. Trivett & Co. (John Trivett, T. C. Stevens and others) have run several tunnels, one to the main shaft being 160 feet long, and have drifted 162 feet west from the shaft. The tunnels drain the mine. Mr. L. Rowley is foreman. The ore contains a considerable amount of iron and copper sulphurets. It is hauled to the company's mill, near by, and yields on the average (so I am told) \$60 per ton, sometimes running as high as \$100. The mine looks excellently well. The mill is a fine affair, which the owners have been repairing and remodeling, introducing all necessary improvements. The engine is of 25-horse power, with two tubular boilers, is known as the Little Giant, and uses only two cords of wood in 24 hours. The stamps drop 50 times per minute.

Hollman & Co. own another mine near by on the HARLEM ledge. This they claim to be a distinct vein; others say that it is a spur of the Iron Rod, while some affirm that it is the same as the Iron Rod.

THE CLIFFER MINE is located above the Iron Rod, is owned by H. Lehmer & Co., and promises to become one of the leading mines of the district. The ledge runs east and west. The shaft is 140 feet deep. The ore resembles that of the Iron Rod.

Argenta—Bannock.

Argenta is a small place on the road from Ryan's Junction to Bannock. Here is the T. E. TOOLE M. Co.'s property. Their mine is being worked and is paying well. The ore is galena and is smelted. The furnaces have given considerable trouble formerly, but Mr. George W. Stapleton has succeeded in running them profitably, and deserves the highest credit for his proven ability. Formerly the bullion was all shipped to New York, but Mr. Stapleton informed me that the advertisement of Selby's works in the SCIENTIFIC PRESS led him to write for information as to shipments to San Francisco, and very likely your city may receive bullion from this side of the mountains.

Bannock, the county seat of Beaverhead county, 75 miles west of Virginia City, is the place where mining was first carried on successfully in this territory, although not the place where gold was first discovered. At an early day rich returns were obtained here and many miners came hither. When Virginia City rose into prominence, large numbers left this camp for that place. Mining is at a low ebb here now. I noticed a smelting furnace, a few quartz mills and a large number of lodes, as the Dakota, St. Paul, Wadham, Springfield, Cherokee, True Flag, etc. These are gold lodes, containing a low grade ore, which many are inclined to think might be worked to the best profit by the arrastra process, not guaranteeing the expense of costly machinery.

W. H. M.

[TO BE CONTINUED.]

To and Through Lake County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

On the Road.

Ens. PRESS:—Thinking that perhaps you might some time like to take a pleasure trip for the benefit of your health, and also to see some of the most beautiful scenery and sights of this county, I herewith send you a slight description of what is to be seen here, and also on the way hither.

Starting from San Francisco, we take the steamer New World, at 4 o'clock P. M., to Vallejo. This is a flourishing town of about 5,000 inhabitants, situated on a good harbor, three miles long by half a mile wide, which separates it from Mare Island, where the U. S. Navy Yard is located. The climate here is fine, being free from ocean winds and fog and the excessive valley heat. We now take the cars for Calistoga, passing through the beautiful Napa valley and stopping a few minutes at Napa City. This is a thrifty village of about 3,500 inhabitants, situated in about the center of Napa valley, and surrounded by one of the finest agricultural regions in the State. Fruits of all kinds abound in great luxuriance. The climate is beautiful. The well known Napa Soda Springs are situated a few miles east of the town. We now leave here, follow up the valley, passing a few small stopping places here and there, and finally reach Calistoga, the terminus of the Napa Valley R. R. It is in the center of a valley about a mile in width, surrounded by hills and mountains. The town is handsomely laid out, with villa residences, two hotels, two or three stores, stables, etc., besides the well known Calistoga Springs, attached to which is a warm swimming bath, forty feet square, an attractive feature of the place. The surrounding scenery is beautiful, the wild grandeur of rugged mountains, covered with oaks, pines, ash, maple and madrona, besides a great variety of shrubbery, mingling in the same view with cultivated fields. It is the center of considerable teaming business, the various routes connecting it with Russian River valley, Lake county and other points. Leaving this beautiful valley we now take the stage, and commence to wind our way up over rugged, steep mountains (but yet over a good graded road), from the top of these mountains having a fine view of the valley below us. We soon reach

Lake County.

This county is bounded on the north by Colusa and Mendocino, on the south by Napa and Sonoma, on the east by Colusa and Yolo, and on the west by Mendocino and Sonoma. It is about sixty miles in length by about twenty miles in average width. The whole of it is embraced within two branches of the Coast Mountains, running nearly north and south, covered with timber of various kinds, underbrush, wild-oats and grapes; also all kinds of wild game are in abundance. We pass numerous places such as Siles saw mill, Bradfords, Soconoma valley and Cayote valley, in the two latter of which are situated some very fine ranches. In this county are numerous hot and cold springs of all qualities, colors and temperatures, besides vast deposits of sulphur, quicksilver and various other minerals. One of the most valuable springs is the well known Harbinger Springs, situated in a very pleasant location surrounded on all sides by mountains which are thickly covered with numerous varieties of trees and wild shrubbery and in the spring of the year with thousands of wild flowers. Then there is the Sigler valley, a few miles south-west of Lower Lake, a very fine little vale surrounded by mountains of the most picturesque form. One of these mountains, from which the valley receives its name, contains a large number of springs, ranging in temperature from icy coldness to boiling heat, of different colors and flavors, including one of cold soda water. At both these localities there are good hotel accommodations for visitors. Leaving this interesting locality, we now reach the town of

Lower Lake.

This is a pleasant healthy town, situated near the outlet of Clear Lake, about 35 miles from Calistoga. It contains one good hotel, one or two restaurants, three stores and a few other places of business, also numerous dwelling houses, one large public school house, sometimes used for a church, one young ladies' seminary, and supporting one newspaper, the Lower Lake Bulletin, (a live journal). Ascending the mountains just back of the town, we get a good view of Clear Lake and the surrounding valley and mountains for miles and miles. About one

mile west of town near the margin of the lake, is a very cold soda spring, besides numerous others of different kinds. On our way to the upper end of the lake, we pass fine ranches, here and there, for miles. We now go over vast deposits of obsidian or volcanic glass, near the base of what is known as Uncle Sam mountain, which has an altitude of about 4,000 feet above the level of the sea. We ascend this mountain, which rises almost perpendicularly from the waters of Clear Lake to an altitude of about two thousand five hundred feet, and from here get one of the finest views of

Clear Lake

That is to be found. This beautiful sheet of water is about 1,500 feet above the level of the sea. It is about 30 miles long and from two to ten miles wide. Its waters are as clear as crystal, cool and, in some places, quite deep, from one end to the other full of fish of different varieties, and unbroken by a single island. The narrow portion of the lake, however, contains several beautiful little isles, inhabited by Indians, who live on roots, fish and game, which are abundant. This lake and vicinity afford fine amusement for all persons who are fond of fishing and hunting. North-west from here is a belt of fine bottom-land, known as Big Valley, which rises gradually from the border of the lake, extending to the head of the main valley, nearly two miles wide, thickly sprinkled with oak and willow, and traversed by numerous small streams which empty into the lake. The eastern shore is quite mountainous; but towards the north the range is much broken, and several creeks flow into the lake. Along the banks of these creeks, and at bottom places near the shore, are considerable patches of rich grazing land.

Kelsey Creek.

We now pass along the valley and finally come to the village of Kelsey Creek, a thriving little village, which contains one hotel, two or three stores, one good school house, one church, and a number of dwelling houses. In the immediate vicinity are quite a number of fine farms. A little south of the town is a somewhat singular place of about two acres, where you can dig a hole almost any where 3 or 4 feet in the ground and find gas springs, which, when lighted, will burn for hours with a strong blue flame; and if you put an old stove pipe in the hole and bank it up, it will burn for months, sometimes at night blazing up two or three feet, showing that there must be vast quantities some where below. Perhaps at some future day it may be made useful. Leaving here we now follow along the valley, passing numerous fine ranches here and there, until we come to

Lake Port.

The county seat of Lake county is situated on the shore of Clear Lake, about 100 miles north of San Francisco. This town commands a good view of the lake, and is a place of frequent resort for persons who are fond of fishing and hunting. It contains the county court house, one fine hotel, three or four stores, one fine school house, one church and quite a number of dwelling houses. It also supports one good newspaper. Good agricultural and timber land is found in the vicinity, a large number of fine farms extending along the margin of the lake for miles. In summer the winds blow mostly from the north and west, in winter from the south and east. It is said that the rainfall of this locality equals, if it does not exceed, that of any other place in the State. After taking a fine sail on this lake, and having a good time fishing, we cross to the opposite side and come down to the Sulphur Works refinery, situated on the margin of the lake. Here the crude sulphur is refined for market, hundreds of tons being prepared in the course of the year. Near these works are numerous hot boiling springs, which contain large quantities of soda. A short distance from this is quite an extensive deposit of

Sulphur.

Which is well worth visiting, where the solfataric acid is yet apparent. The volcanic rocks have been extensively fissured, and through the orifices and seams, steam and sulphurous vapors are constantly issuing. A large amount of sulphur has been deposited, the extent of which is uncertain and can only be demonstrated by the pick and shovel, though it is known to occur over an area of several acres. One of the most interesting facts in connection with these deposits is the association of cinnabar with the sulphur, sometimes distinctly separated from it in quartz, evidently deposited from solution, but often thoroughly intermixed with it. On this are also deposited some very beautiful straw-colored crystals of native sulphur. In working these banks, they frequently break into small caverns which are filled with beautiful stalactites of native sulphur, in all forms imaginable. There appears to be enough sulphur here to last for a hundred years to come.

Some time ago I was reading in one of the scientific journals, of a vast deposit of solid sulphur. The recent boring of artesian wells, on the Calcasien river, in Louisiana, has brought to light the existence of an immense deposit of solid, pure, crystallized sulphur at a depth of 400 feet, and more than 100 feet in thickness,—a stratum which, perhaps, has scarcely its parallel in geological history. The commercial value of such a bed of sulphur is enormous, and we shall doubtless soon hear of

a shaft being sunk and the mineral taken out in large quantities. If such is the case, why may we not suppose that these are as vast a deposit in the Clear Lake sulphur banks? Perhaps one of these days we will see this tested.

Borax Lake—Quicksilver Mines.

Going about two miles north-west of here, over a small range of hills, we come to the well known Borax Lake. This is a sheet of shallow water, the average depth of which is from three to six feet, comprising generally about one hundred acres in superficial area, but varying greatly in size with the seasons, as the shores are low, and their slope towards the center is very gradual. The water of the lake is highly impregnated with borax. The principal deposit of crystals is in a layer of blue mud of varying thickness, beneath which is mud free from borax. At present they are not working in this lake, but intend to do so soon.

Leaving here, on our road back to San Francisco by way of Knoxville, we pass the extensive quicksilver mines of Knox & Co., known as the Manhattan mine, where a large number of hands are employed. They have quite large furnaces erected here for the extraction of the metal. We next pass the well known Redington quicksilver mines, where there are also quite a large number of hands employed and also large furnaces. As these mines are so well known to the public it will hardly be necessary to give a description here, especially as that would occupy so much of your space. But I may give one in some future letter.

The town of Knoxville is situated on a hillside and in a canyon. It contains quite a number of small dwelling houses, one hotel, one store and one school house. There is also quite a number of work shops of different kinds connected with the mines. Stages connect here with Napa. From here we pass by the Zem Zem Sulphur Springs, which are said to be very valuable for various complaints. Passing various ranches here and there, we come to the town of Monticella, quite a flourishing place, situated right in the midst of a very fine farming country, containing numerous stores and shops, one or two hotels, one school house, one church, etc. Leaving here and passing numerous ranches on our way and enjoying some fine scenery, we finally get back to where we started from.

From Cerro Gordo.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

EDITORS PRESS:—I suppose you have begun to think that I had "chopped" on you, as the Californianism would have it, but such is not the case. I have simply been waiting until something of moment should transpire which might interest the "outside world." On this side of the Sierra, this season has been an eventful one. The Cerro Gordo mines have proven fully as good as the most sanguine have anticipated, the furnaces have been as fully successful in reducing the ores. Cheap transportation is all that is required now to place this section as the *ne plus ultra* of mining enterprises in California.

Cheap Transportation.

While touching upon the subject of cheap transportation to and from this valley and adjacent mines, I may remark that, in my opinion, there is the greatest chance for a profitable investment in a railroad (that would pass through this valley from the Central Pacific to Los Angeles,) that there is on the continent of America at the present day. And for these three reasons: First, the grading would cost only a nominal sum, and ties could be furnished at a small expense for the whole route from the Sierra Nevada. Second, the road would pass through seven hundred miles of as rich a mineral region as there is upon the face of the globe, and it certainly is a very fair agricultural section, which would materially augment the traffic. Third, if the Pacific Railroad companies had this proposed connection or branch road, passengers, in place of being exposed to the inclemencies and dangers, of the passage across the Sierra in winter time, could pass through a temperate and almost tropical climate over the whole route, and entirely free from the dangers of avalanches, blockades of snow, and other dangers too horrible to think of.

Mines.

As a sample of what this country is beginning to be thought of, I will state that the Kearsarge mine, situated about 12 miles west of this town, under the supervision of a Mr. Pierce, for the first time in its existence has this season cleared all expenses of improvements, mining, milling, etc., and left a heavy margin for further improvements. Gen. J. B. Winters, Chas. Van Gorder and Col. Avery, of Gold Hill, Nevada, the largest owners of the above mine, paid a visit to the mine and were so well pleased with the prospects, that new improvements have been ordered, and would have been under good headway by this time, if the late storm had not taken place. As it is, I suppose they will be delayed until next spring, when it is the intention of the corporation to erect a large Stetefeldt furnace, build a tramway from the mine to the mill, and put in a 30-inch turbine wheel, to drive the mill, in place of using the steam engine now in use for that purpose. Mr. Van Gorder is expected down again in about two weeks, when I may obtain some other items of interest to your general readers. Gen. John B. Winters will be the future superintendent.

CROWQUILL.

Independence, Inyo Co., Nov. 21, 1870.

Mechanical Progress.

NEW METHOD OF LAYING RAILWAY TRACKS.—A. Platte, Superintendent of the Austrian Crown Prince's Railway, suggests a new plan in the *Journal of Austrian Engineers*. He proposes the use of the best steel rails, of such shape that they can be used on one side until worn out, when the rail is reversed. This is enabled to accomplish by the use of a rolled-iron longitudinal support, which forms a continuous iron box, in which the rail is laid. This trough or box, with a base from six to ten inches broad, is laid directly upon the carefully prepared road-bed, and provided at suitable intervals with lugs on each side, through which bolts are passed, which secure the box to the iron cross-pieces used in place of wooden ties. Thus the cross-pieces or ties are firmly secured to both the inner and outer sides of both boxes. The sides of this box are of different heights, the outer being two or three inches the higher, and to this side the rail is bolted, a piece of hard wood being interposed between the rail and the side of the box. The ordinary fish-bars are used to complete the connection of the ends of the rails. When the rail has thus been bolted to the side of the box, its under side is two or three inches from the bottom, and its sides about the same distance from the sides of the longitudinal box. The space thus left Mr. Platte proposes to fill with melted vulcanized rubber, or with some other substance possessed of considerable tenacity and elasticity.

A NEW JOURNAL BOX.—Murphy's journal box and lubricating material is thus described in the *American Artisan* for Nov. 16th: "In preparing the lubricating material, the surface of a sheet of paper, leather or chamois skin is so operated on by a fine picker, as to separate or raise the fibers, so as to produce a flocky surface upon a stiff, strong and unyielding backing. This is done by subjecting the paper to the action of a series of circular saws having teeth of such shape as to penetrate but not pass through the material. Thus provided, the surface is covered with powdered plumbago or similar lubricant sifted upon it, and then passed between pressure-rollers. In some cases, before the application of the plumbago, the surface is treated with a solution of india-rubber and paraffine. A sheet of lubricating material thus prepared, with a backing of felt or leather, may be used either for packing or bearings. After the material is placed in the bearing, the surface should be rubbed with a suitable tool, so as to provide a polished surface."

THE HOOSAC TUNNEL.—A colossal transit instrument has been constructed at the expense of the State of Massachusetts to facilitate the work. A line twenty-seven feet in length, has to be marked at the bottom of the dark, wet central shaft, 1,030 feet deep, so that when prolonged, it shall pass through the terminal points of the eastern and western approaches, each being 12,000 feet distant. The external line of the tunnel has to be surveyed over the surface of a rugged mountain, and across points from 1,500 to 1,800 feet above the grade at the termini. By means of this instrument the most accurately verified lines have been run over the Hoosac mountain, and have been extended for many miles in both directions.

NEW HAMPSHIRE LOCOMOTIVE WORKS.—The *Iron Age* says At the locomotive works in Manchester during the year ending October 1st, the castings amounted to 2,200,000 pounds. It is said to be a day's work for a man, with an assistant, to make a driving wheel, the weight of which is 1,500 pounds, sometimes ranging as high as 1,800. At these works, one man has turned out his wheel a day for 774 successive working days.

IRISH HOD-CARRIERS SUPERSEDED.—We see described an arrangement, consisting of an endless chain ladder, by means of which two men at the cranks can raise to the top of a building seven hods of brick or mortar per minute. The ordinary hod is furnished with a hook, and the laborer has only to hang it on the ladder, from which it is taken by another laborer at the top of the building. A dozen hods may be going up and down at once.

PEAT FUEL FOR LOCOMOTIVES.—The managers of the peat-works near Meriden, Conn., have published an article upon this subject in the *Iron Age*, setting forth the advantages claimed for this fuel, as observed during practical tests continued for several weeks. "No destructive agent, such as sulphur, phosphorus, or arsenic, exists to corrode the grate bars, sheets, or flues; there is no accumulation or deposit of clinker or unburned peat upon or between the grate-bars; no incrustation of soot along the flues; no deposit of ash in the smoke-box; nor is there any emission of heavy sparks, lighted coals, or smoke from the top of the stack. * * * Under fair condition of track and good weather, a result was obtained of 7.75 lbs. of water for 1 lb. of peat burned. The above, if calculated by size of cylinders, diameter of driver, speed, and pressure for distance run, will prove the statement, showing, say, 139,890 cubic feet of steam, by consuming 2,620 lbs. of peat fuel. No doubt exists that, by better knowledge of the way of firing, the above result can be exceeded, which, if it shall be the case, will place peat fuel above coal or wood, at one-half the price, throughout the United States; for the deposits of peat are everywhere generously distributed. The duty of the bituminous coal, as used in the United States, is found to be from 7 to 10 lbs. to evaporate 62½ lbs. of water. The above especial duty, under careful manipulation, shows peat at 9 lbs to 62½ lbs. of water—a result almost equivalent."

IMPROVEMENTS IN STREET CAR CONSTRUCTION.—We condense these items from the *Chicago Railroad Gazette* of November 5th, which describes a new car furnished with all the latest improvements: The brake consists of a shell or dish wheel made fast to the axle of the car wheel, fitted with an entering cone wheel which is loose on the axle, and which is forced into the dish wheel by straightening a knuckle-joint, one arm of which abuts against a shoulder on the axle. The journal bearing is formed by three steel interlapping friction rollers, resting upon the top of the journal. A swing motion is given to the car body by the following device: The body rests on eight rubber springs—the springs resting on projecting shoulders of the journal casing. Passing vertically through each spring and the shoulder of the casing is a bolt, extending from the car body to the stirrup brace below. The hole in the casing shoulder has twice the diameter of the bolt; and by this simple means ample lateral play is given to secure an easy and comfortable swing motion. A series of annular rubber springs on the follower is so arranged with reference to the form of the draw head, in combination with the journal bearing described, as to wholly avoid the violent jerking so disagreeable usually in starting.

THE BEUTHER AXLE-BOX.—Of this the *London Engineer* says: "The main features consist in drawing up the oil, by capillary attraction from below to cotton pads, so hinged against the journal as freely to adjust themselves to it by gravity; and the spent oil is led into a central receiver below, where it can deposit its abraded metal and grit. A cast iron cover is fitted to the box, which is cast with lugs to receive the hinges of the brass side pad holders. From four slits in the back of each holder there hang down as many syphon wicks, dipping into the main reservoir below. Any excess of spent oil drops from the axle into the central wrought iron cup, which only communicates with the main reservoir by holes at its upper end, so that it forms a separation of any impurities."

COPYING DRAWINGS BY THE AID OF THE INDUCTION COIL.—All draftsmen are acquainted with the device of puncturing holes through a drawing for the purpose of obtaining an outline and afterwards transferring the outline by sifting fine plumbago or other powder through the small holes. The fatigue of making the holes by hand is great, and M. Claudray, of Lausanne, proposes to employ the induction coil for this purpose. A table covered with tin-foil is connected with the negative pole, on it may be placed as many sheets of paper as the spark will pass through. The positive pole, consisting of a metal bar, insulated with gutta-percha, can serve as a pencil for copying the tracings. The metal point of the pencil being moved about on the contour and outline of the engraving, electric sparks spring across every time a connection is made, and puncture fine holes through the paper.—*Sci. American*.

Scientific Progress.

THE TENDENCY TO VARIATION UNDER LIES NATURAL SELECTION.—The following detached paragraphs are from a paper read before the British Association by Alfred W. Bennett:—"Every gardener knows how uncertain is the produce of seeds compared with the produce of buds or off-shoots from the same plant. The ordinary mode of obtaining new varieties of strawberries or other fruits is from seeds. An endless variety of the commonest florist's flowers is produced by sowing seeds from the same capsule. Of the laws of this variation we are, as Mr. Darwin says, 'profoundly ignorant'; but it does not follow that a patient interrogation of nature pursued in the true Darwinian spirit, may not reveal to us something of these laws. Of one thing we are certain, that natural selection here plays no part. If then we must admit that the first beginning of change takes place without the operation of this principle, why should we claim for it the main, almost the exclusive agency, in the changes which follow? Some other principle, at present unknown to us, originates these variations; what right have we to say that this principle, whatever it may be, then ceases to act, instead of being the main agent in all the other subsequent changes? * * * M. Claparede, one of the few genuine Darwinians among French writers, points out the dangerous and unscientific manner in which the theory of natural selection is made, in the hands of its too zealous advocates, to explain phenomena which are probably due to other causes. The discovery of this law marked an era in the history of natural science, and gave a wonderful impulse to original research. The danger now is that the law will be pressed into services which have no claim upon it; and that, in the hands of injudicious partisans, it will become a hindrance rather than an aid to science, by closing the door against further investigations into other laws which lie behind it. To claim for natural selection the main agency in the creation of the countless forms of organic life with which we are surrounded, is straining it beyond its strength. An era of equal importance will be marked by the discovery of the law which regulates the tendency to variation which must necessarily underlie natural selection. The argument of 'design' was undoubtedly pushed by pre-Darwinian writers to too great an extent. The most recent phase of Darwinianism, however, is a complete denial of the existence of design in Nature. It is the carrying into natural science of the Hobbesian principle of self-love. Every individual and every species exists for its own advantage only, and has no *raison d'être* except its own welfare. To my mind the beauties and wonders of Nature seem, on the other hand, to teach a different lesson; that there are laws, albeit almost unknown to us—not laws merely of external circumstance, but laws of internal growth and structure,—which actively modify each individual organism, not only for its own advantage in the struggle for life, but for the higher end of subordinating every individual existence to the good of the whole."

ENERGY OF POSITION.—"In a fire, we burn carbon, and make it unite with oxygen in order to form carbonic acid, and in so doing we change the energy of position derived from the separation of two substances having so great an attraction for each other, as oxygen and carbon, into the energy of heat. In a leaf, on the other hand, these two strongly attractive substances are forced asunder, the powerful agent which accomplishes this being the sun's rays, so that it is the energy of these rays which is transformed into the potential energy, or energy of position represented by the chemical separation of this oxygen and carbon. The carbon, or rather the woody fibre into which the carbon enters, is thus a source of potential energy, and when made to combine again with oxygen, either by direct combustion or otherwise, it will in the process give out energy. When we burn wood we convert this energy into heat, and when we eat vegetables we assimilate this energy into our systems, where it ultimately produces both heat and work."—*Bilfour Stewart*.

THE EASTERN EARTHQUAKE WAVE.—At the moment when the late earthquake was felt at Mimonski, Canada, the telegraph operator sent instantly to Quebec, a distance of 200 miles, to ask, "How do you feel?" While the operator was at his work the shock arrived. He at once sent to Montreal, about 200 miles further on, to ask if they had felt it. They had just time to say "No" before the earthquake came up.

MOTION NO PROOF OF LIFE.—The following is from an article by "C. S." in the *Boston Journal of Chemistry*: * * "Here is where I believe the great mistake of microscopists has often been made, probably in part owing to inferior instruments. They have assumed that a body with a 'jerking movement,' or any movement, must be an infusorium, or a germ, or some organic being. This is the important point now for the study of microscopists. In August, Mr. D. S. Holman, of Philadelphia, brought to me a slide. It was placed under the microscope with a good objective, and I saw the field filled with an immense number of minutespheres, all in lively motion. I at once saw that they were what have been called monads by some writers, germs by others, and 'oöplasm' by Beale. Mr. Holman then informed me that what I saw was white of eggs coagulated by carbolic acid; that it was prepared and sealed up in July, 1869; and that the lively movement had been going on constantly ever since. A few days since I prepared some white of egg myself, and have obtained the same results. The whole field of the microscope is filled with minute granules, all dancing together. Now here we have matter in which it is impossible that any animal or vegetable life can exist, and yet in which there is present that one evidence of life, motion. Nor is this all. I have prepared slides of inorganic matter,—e. g., minute particles of chalk and china clay, suspended in a solution of glycerine in alcohol; and these not only present the same movements, but an expert eye cannot distinguish a particle of organic from one of inorganic matter, with the same magnifying power."

DISEASE GERMS.—We quote a few sentences from an article in the *Microscopical Journal* by Dr. Lionel S. Beale, F. R. S.: "In vaccine lymph which has been kept for some time in glass tubes multitudes of very minute particles are observed, and these exhibit the most active molecular movements. These particles have often been termed *debris*, and have been regarded as quite unimportant elements of the lymph. To them, however, the active properties of the lymph are entirely and solely due. And I should be no more inclined to regard the fluid portion of the vaccine lymph as the active material, than I should be to assume that the fluid in which the spermatozoa were suspended was the fertilizing agent, and that the spermatozoa themselves were merely epithelial *debris*, and quite unimportant; or to infer that the fluid in which the yeast fungi or bacteria were growing was the active agent in exciting fermentation, while the actually growing, moving, and multiplying particles were perfectly passive. The germinal particles in all cases are, without doubt, the active agents, and it seems to me as much opposed to the facts of the case to maintain that the *materies morbi* of cattle plague and other contagious fevers is a material that can be dissolved in fluid, and precipitated and re-formed, or sublimed as a volatile substance, as it would be to look upon any living organism as the result of the concentration of an albuminous solution, and capable of resolution and precipitation. * * I consider it to be almost certain that the material of which these particles are composed has the power of forming matter like itself from pululum around it, which differs from it in properties and composition. Such living germs may pass from the organism on which they grew to another, and will grow and multiply there if they meet with the proper pululum. The only condition in which matter is known to exhibit these powers of self-multiplication is the living state."

OXY-CALCIUM LIGHT IN PHOTO-MICROGRAPHY.—We some time since noticed the report of Lieut. Col. Woodward on the use of the magnesium and electric lights in photo-micrography. Since that time he has made experiments with the oxy-calcium, or Hare's light, for the same purpose; and announces in the *American Journal of Science and Arts* that he has succeeded in obtaining excellent pictures with powers as high as a thousand diameters, that he finds the light steadier than either of the others mentioned, and that it is managed with less trouble.

Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

California.

ALPINE COUNTY.

EXCHEQUER MILL.—*Chronicle*, Nov. 26th: Yesterday the steam was turned on. The saw-mill portion is running, and it will not be long ere the stamps will be clattering. This is an eight-stamp mill, with a furnace for roasting ore. The amalgamating is carried on in six wooden barrels. The engine is of sufficient capacity to run the quartz and saw mills at the same time.

GLOBE.—*Miner*, Nov. 26th: Machinery to the amount of 20,000 pounds weight arrived at the works to-day. The carpenters will have the frame raised next week.

MONITOR No. 3.—Yesterday the workmen struck into a large pocket of soft ore of the Tarshish sulphuret variety. They are evidently coming into one of the regular pay-ore chimneys.

TARSHISH.—Besides the strike in Monitor No. 3, the Schenectady on the same lode has encouraging symptoms. The soft ore stored is being washed for shipment, and the shaft to connect the two levels is progressing at a favorable rate. The Silver Glance tunnel on the same lode is making good headway.

AMADOR COUNTY.

THE KENNEDY.—*Ledger*, Dec. 3d: The work on the new hoisting works are fast approaching completion. The boiler is in position. During the week a survey has been made for a ditch to supply water, and men set to work on it.

GOOD HOPE.—Mr. Charles Peters having bought out the partners in this mine, has commenced work in earnest. The mine is believed to be on the Hayward lode. Mr. P. has just completed new hoisting works, propelled by a mule. The shaft is down 70 feet.

The company of Chinamen in the bed of Jackson creek, are making from two to four dollars per day to the hand.

INYO COUNTY.

CERRO GORDO.—*Independent*, Nov. 28th: Beaudry's furnace started up Tuesday, and has been reducing ore to metal at the usual satisfactory rate. Belshaw's works are in full operation, having on hand sufficient supplies for a month's run.

GRANITE MOUNTAIN DISTRICT.—A miners' meeting at Darwin Springs, on Oct. 24th, organized a mining district with the above name.

NEVADA COUNTY.

OMEGA.—*Gazette*, Nov. 29th: Extensive preparations have been made for hydraulic mining. The Prescott claims, Kidd & Co., have their drifts run, and are ready to fire their blasts. They use 50 to 75 kegs of powder only, having proven that for their claims that amount does better than a greater. Their blasts are exploded 75 feet in from the face of the bank. Kidd & Co. will use in these claims 600 inches of water. They have 700 feet of pipe from eleven to thirteen inches in diameter. Their banks are 140 feet high, and their pressure is also about the same number of feet. The same own the Teeple claims, which are in complete order for working. In these they will use 600 inches of water, through 300 feet of 17-inch pipe. Two blasts of 39 kegs each were fired last week. Pease & Co. have their claim in order. They have 300 feet of 13-inch pipe and will require 400 inches of water. They work their ground by blasting. William Perry is opening a new set of diggings near town, and will use 250 inches of water. He has 500 feet of 11-inch pipe. M. McSorley will work his claims with 400 inches of water through 400 feet of 11-inch pipe. Amount of pressure 160 feet.

Moses Bates is making preparations for hydraulicing and will use 250 inches of water. The five companies we have mentioned will use 2,500 inches of water, while the total amount used at Omega, this season, will not fall short of 3,000 inches.

THE RAIN.—*Transcript*, Nov. 30: The first regular storm came on with a howl on Monday, and continued yesterday. The miners rejoice at the prospect of abundance of water.

NEW DITCH.—Same of Dec. 1st: Contracts have been made by the Eureka Lake Ditch Co., for the building of a ditch from Shady Creek to the Buckeye Hill diggings, near Sweetland, five miles. A large number of Chinamen have been employed.

GETTING READY.—Same of 3d: Very extensive preparations have been made throughout the county for working gravel claims, and there is every prospect of "big runs."

KATE HAYES' FLAT.—The Welsh Co. are taking out very high pay. Eddy & Co. and

Bell & Co. are about ready to commence operations, and in the claims of the former a blast of 1,500 pounds of giant powder was to be discharged yesterday.

ITEMS.—*Grass Valley Union*, Dec. 1st: The Hope Gravel Co. on Alta Hill is erecting an eight stamp crushing mill, and running two bed rock tunnels fifteen feet below the one now in use. The yield for the month has been over expenses. Wednesday very rich cement was struck in the west drift. This stratum is fully three feet in thickness, and is richer in gold than any dirt which has yet been found in any part of the east drifts. The gravel on Goshen Hill is on the same channel which runs through Alta Hill, Randolph Hill, Rich Flat, and down to Sucker Flat, in Yuba county, where it meets with the San Juan North, Sweetland and French Corral channel. On Goshen Hill Black & Landis are running a bed rock tunnel which is now in 609 feet, and through which they intend to commence washing in February. At Randolph Flat, McSorley & Co. have their tunnel into the gravel at the bed rock. The flume is completed, iron pipe is being laid, and washing will soon commence. The Picayune Co. have rich gravel, and will complete their drain this month. Alta No. 3 has a steam engine on the ground and will soon commence sinking for the channel. Webster & Co. are putting up steam machinery and expect to be taking out gold by February 1st. It is estimated that these claims will pay from \$30 to \$50 a day to the man. The Baltic is an incorporated Co. and has only to build a flume across the road to be ready for washing. This company has 800 feet of flume and 800 feet of iron pipe. The Red Jacket is near Mooney Flat, supposed to be on the same channel, and the company is running a prospecting tunnel. The Town Talk, east of Grass Valley, is washing cement. In quartz, the Eureka on Saturday, cleaned up \$57,000 for 24 working days, run, without cleaning up the batteries. Of the Empire mine, the pumping out has been going on for some weeks, and the water was reduced to a point about 30 feet below the 7th level. At this point the pump gave out and the water rose to near the 7th level, when a reserve pump was put in, which started to work yesterday. The mine will soon be free of water. Before Christmas the new mill will be completed. The Coe mine is worked in the first level on shares, and the second level of 270 feet is being opened. The rock shows much sulphurets. Perrin's mine is being opened at a lower level and crushing will be resumed in five weeks. The Idaho, North Star, Allison Ranch, Green Mountain, Greenhorn, Golden Gate, Wisconsin, Phoenix, Orleans and several other quartz mines have been worked during the month with good results.

PLACER COUNTY.

RICH MINE.—*Herald*, Dec. 3d: The claim known as the "Green Mine," a mile west of here, is a remarkable one. Wm. G. Green and partner have worked it two years, more in prospecting and putting it in shape for future working than for getting out gold; and yet the claim has yielded more money than could be profitably expended. The water being taken out of the ditch some weeks ago, their hoisting works were stopped and they had to suspend work on the lower level—128 feet. They then came up and ran in at 80 feet from the surface, and have within the past 10 days taken out ore enough to pay for all the work ever done on the mine, and erect a fine quartz mill besides.

THE ST. PATRICK.—Systematic work on this claim is pushing the shaft deeper, until now it has reached a depth of 180 feet. Near the surface the ledge only averaged from eight to 14 inches thick, but it has widened as they went down, until now, at the above depth, it is two and a half feet. The ledge shows good quartz—sometimes very rich—for the whole distance down.

SAN BERNARDINO COUNTY.

THE GREEN LODGE.—Cor. of *Guardian*, Nov. 26th: This has been opened by two shafts and a tunnel, that cuts the ledge at 200 feet, and levels run 200 feet on the ledge each way from the tunnel, and is now ready to commence stopping out ore that will pay \$60 per ton. The mill, with a crusher and six arastras, is nearly ready to run.

The same writer says that Gold and Silver District, nine miles distant, has a perfect net-work of ledges for seven miles by twelve, and abundance of timber, with water-power for a thousand stamps.

SAN DIEGO COUNTY.

A telegram of Dec. 5th says: Reports from the Julian Mining District are unfavorable. The mills are only making half time. Little or no rock is being taken out. The miners who own the ledges lack means

or energy to develop them. It is thought that the grant-holders will establish their claim to the whole district.

SIERRA COUNTY.

ITEMS.—*Messenger*, Dec. 3d: Wehe & Co. have 40 tons of rock at the Leonard Mill ready to crush. The Monte Christo Co., near Port Wine, have struck some very rich ground—the richest ever found in their claims. Cox & Williams have sold a four tenths interest in their claims at Seales', to a party from Cleveland, Ohio, for \$150,000. William Howell, Jesse Hughes, and two other partners, have sold their hydraulic claims at Council Hill for \$48,000. The Iowa Co., near Dutchman's Ranch, having run a tunnel 200 feet from the bottom of their shaft, and finding the bed rock pitching into the hill, have abandoned their old works and concluded to work through an incline.

SIERRA VALLEY.—Cor. of same: "Antelope District" was organized in 1862, and several shafts sunk alongside of ledges the croppings of which prospected well. But no effective prospecting was done, and since 1866, nothing. Last August W. R. Patten and others took up a ledge which they named the "Bullion," and as the records of the old district were missing, a new one was organized under the name of "Sierra Valley." Since that time, prospecting has been general, and 75 claims are now recorded. On the "Bullion," a ledge over a mile of which crops out often 100 feet high, and from 10 to 100 wide, six companies, comprising 6,800 feet, have been located. Three have commenced work. Five pounds of ore from the Bullion shaft, six feet down, was assayed with the following results: Copper, 42½ per cent.; silver, \$54.97 per ton. The Co. have a number of tons raised, which they intend shipping to the Reno mills. These mines are most favorably situated for access and for development. There is an abundance of timber and water. The ledges are grouped in two equal parts, one each side of the valley, half a mile apart, and affording between a beautiful site for a town, which has already been surveyed and is called Alten.

SISKIYOU COUNTY.

QUARTZ MILL.—*Yreka Union*, Nov. 30: A four-stamp mill arrived on Monday for Moses & Co. Messrs. Moses, Autenrieth, Warren and others, have obtained possession of the Shasta Butte claim.

ANOTHER IN THE SPRING.—We learn that the Siskiyou Quartz Co., whose claim is on the Middle Fork of Humboldt, intend building in the spring a large mill to be run by steam. This claim is a continuation of the Shasta Butte. Mr. Moses will work both claims this winter, and will put up the mill.

BIG FLUME.—*Journal*, Nov. 30th: Messrs. Edgerton, Ketchum, and Stimmel, are building a flume on the flats above town, to be 1,200 feet long, for the purpose of sluicing off ground that has never been worked and some that has.

TRINITY COUNTY.

ITEMS.—*Journal*, Dec. 3d: Everybody is ready for water, with everything rigged in the best possible shape for work. At North Fork, Schlomer & Hobbe, at work in the bar above the bridge, find first-rate pay. Indian Creek mill is approaching completion. There are two companies looking for the ledge on each side of the creek. Carson, Hansen & Goering have their bulkhead completed, and it will carry all the waters of the creek. Their flume passes under the bulkhead, and a gate admits the necessary water and no more.

Nevada.

COPE DISTRICT.

ITEMS.—*Elko Chronicle*, Nov. 26th: Cave Creek, 50 miles south of Elko, has large ledges, plenty of wood and water, and a fine agricultural country near. An English Co. have offered \$25,000 for the Blue Jacket ledge at Bull Run, which the owners have refused. Vance's mill has not stopped as reported.

HUMBOLDT.

GOLCONDA.—*Silver State*, Dec. 3d: A correspondent informs us that the mine of L. D. Webb is accounted one of the most valuable in the county. Two men, in thirty-seven days, have taken out at least 200 tons of ore that will work up to \$40 per ton. The ledge is improving both in size and quality of ore.

GALENA.—*Register*, Dec. 3d: The Butte Co. have struck in their lower shaft, 150 feet from the surface, a rich body of ore, assaying, \$1,477.26 per ton. The White claim is troubled with water. The Avalanche Co. have been offered \$8,000 for their claim.

REESE RIVER.

A New District.—*Reveille*, Nov. 28th: Sam. Collier, called on us last Saturday with specimens of ore from a new district

on the east range of the Humboldt mountains, eighty miles from here. Two samples were given to the assayer of the Manhattan mill, who returned \$72.26 in silver for one, and \$1,030.49 for the other, which was decomposed. The district was named the "National."

BULLION.—Same of Dec. 18th: Wells, Fargo & Co. have just completed a shipment of silver bullion to New York, consisting of 67 bars, weighing 5,605 pounds, of the value of \$86,869.55. It was all produced by the Manhattan mill, with the exception of \$667.44.

WHITE PINE.

ITEMS.—*News*, Dec. 3d: South Aurora resembles more a military establishment than a mine. Everything goes as regular as clockwork. Large quantities of good ore are being hauled to the Stanford mill daily. In North Aurora Con. the two shafts are being pushed down as fast as three shifts can do it, and the lower one is yielding good ore. In Eberhardt the working force has been increased, and new developments are made all the time. Large quantities of the very best ore are taken out, and the quantity of low grade ore in sight is immense. Ward Beecher has 400 tons of good ore on the dumps, which is being hauled to mill as fast as teams can get it away. The first-class ore is worked in the Oasis mill, Shermantown. Original Hidden Treasure is taking out 50 tons of ore per day, of which 20 tons are first, and 30 second-class, that yields \$29 per ton. Nearly 40 men are employed. Silver Wave is working its usual force, and has lately struck better ore. Silver Wedge is sinking a shaft and prospecting the mine. Mammoth is driving the tunnel ahead, and it is expected the ledge will be struck shortly. Summit is putting the mine in shape for extensive working. Iceberg is being worked by the Treasure Hill M. and M. Co. Anchor is shipping good ore to mill constantly, and work will be kept going during the whole winter. In Noonday good ore continues to be taken out. Sagebrush has some very fair rock. Industry and Nevada are both in good ore.

BASE METAL.—A little business is being done in base metal ores. There seems to be trouble about the hauling of the ore. It costs too much to pack it from the dumps, and in some places the mines are hardly accessible. There is any quantity in sight and on the dumps at the base mines, and most are working yet, but the reduction facilities do not seem to be large enough.

MILLS AND FURNACES.—Work on the International progresses rapidly. Fifty men have been set to work on the wire tramway, who are clearing the route and places for the posts. Stanford Mill is working South Aurora ore. Oasis is working ore from the English Co.'s mines. Sheba is running on ore from the Ward Beecher. Big Smoky is running steadily. Work on the roasting furnace is progressing. It is a kind of inclined cylinder furnace in connection with a shaft furnace, similar to the Stetefeldt. Great results are expected from it. Swansea Mill is kept busy with ore from the Original Hidden Treasure. Monte Christo will start again in a few days on \$200 ore, of which a large quantity is being shipped to the mill. Hamilton Furnaces are running on Jennie A ore, and shipping large quantities of base bullion. Pennsylvania is running on ore from the Base Range. Also shipping a fair amount of bullion.

BULLION.—Wells, Fargo & Co. shipped during the last week, from this city, 46 bars of bullion, valued at \$65,778.25.

EUREKA.—*Sentinel*, Dec. 3d: On Wednesday Carpenter & Co. sent from their mill at Sierra, one bar of bullion of 911 ounces, of the value of \$1,061.21. This is the first bar made at the mill. The roasters are now complete, and the whole mill is in working order. Monroe & Collins' mine, a short distance below the Paige & Corwin, in Secret Cañon, now owned by J. H. Alderson & J. B. Osborne, is producing splendid ore. Thirty tons now on dump will work more than \$200 per ton. The returns of the Manhattan Mill, at Austin, to Paige & Corwin, for ores worked, show a yield of from \$405 to \$1,565 per ton. The X Y Z, of Helgeson & Jardin, has been sold to B. F. Bivins. Work is being done by three men, and there are 70 tons ore on dump. It is the intention to erect a furnace immediately. Robertson, Wilson & Co., dissatisfied with the working of their Water-Jacket furnace, are building a new one on the plan of the Jackson Co.'s furnaces.

Arizona.

JACKSON & CO.'S MILL.—*Prescott Miner*, Nov. 26th: This little five-stamp is, by this time, near its destination in Bradshaw District, and will soon be put up and run.

ning upon the rich ores.

The mining news of the past week is net worth relating. Water is scarce. The only mill running in this section is the Big Bug.

Colorado.

SEATON LODGE.—Mr. Womack has in his west 70 foot level, a solid vein of ore twelve to fifteen inches thick, worth 160 ozs. silver per ton. His receipts for the last 130 tons of first and second class ore sold, show an average value of 155 ozs. per ton.

VIRGINIA CANYON.—The success that has attended the working of the Seaton lode, has given a new stimulus to prospecting in this canyon, and led many to examine their old holes to see if silver is not to be found where they failed to find gold in paying quantities. The result is that several promising mines are being developed. Wm. Hobbs recently struck some rich ore in the Kangaroo, a lode that he struck in '60. At that time it failed to pay for gold, and as silver was not thought of it was abandoned. Jack Needham and others have struck a new lode above the Kangaroo, that is said to promise well.

GRAND ISLAND DISTRICT.—The Caribon main shaft is 105 feet deep. There are other shafts, and some 560 feet of drifts. Throughout the whole of this, the rich vein can be traced. The ore vein averages five and a half feet, the first-class ore about two and a half. The first work was done in '69, when 25 tons and 1,664 pounds were taken out and sold to Hill, assaying 2,451.1 ounces. Amount taken out and sold this year, up to Nov. 1st, 285 tons 1,543 lbs., assaying 31,893.3 ounces. Total, 34,863.4 ounces; coin value, \$44,678.92. Since Nov. 1st about sixty tons have been taken out. The figures are those by which Prof. Hill purchased the ore. This ore was from the two and a half feet of the vein mentioned as first-class, but from it had been selected three tons yielding an average assay of five thousand dollars per ton. Were this added to that sold, the average would be upwards of \$200 per ton. The Pride of the West, a 4½-foot vein, promises well. It is not worked at present. The Idaho, half a mile from the Caribon, has a shaft four and a half feet by ten, and thirty feet deep. From this shaft have been sold to Prof. Hill, about 16 tons of ore worth about \$4,000 in coin. The ore vein is five feet wide. The Jo. Thatcher is reported to assay \$230 per ton. The Trojan has a 54-foot shaft, and 22 inches of ore worth about \$90 per ton. By the side of this ore vein is a crevice ten inches wide of decomposed material which is sold to Hill at from \$96 to \$126 per ton, currency. This vein has been struck for over two thousand feet, and is perpendicular.

GEORGETOWN ITEMS.—*Miner*, Dec. 1st: The ore from the last lode cut by the Monticello Tunnel assays 72 ounces per ton.... The Ni-Wot is still furnishing as good ore as was first struck by the tunnel.... In the Cliff mine, connection between the shaft and tunnel will soon be made, and the mine placed in good working order. The old shaft was in good ore when the water drove them out last year. The present working undercuts that shaft.

Idaho.

OWYHEE.—*Avalanche*, Dec. 3d: The Golden Chariot mine looks better than ever. At the bottom of the sixth level, between the south winze and the shaft, the vein is nowhere less than three feet wide. The ore from the fifth level is being hoisted through the Elmore shaft. The machinery for the new works arrived this week. Both the Owyhee and Ida Elmore mill are kept busy crushing Chariot ore.... W. H. Clark has completed his contract for sinking the Ida Elmore shaft 50 feet. A contract to sink an additional 50 will be let.... Superintendent Pheby is fixing up the Mahogany for winter working. The Webfoot mill is running on Mahogany ore.... Cosmos mill will, in a short time, start up on Oro Fino ore.... Another batch of Red Mountain ore has been worked at the Cosmos mill, yielding satisfactory returns. The Red Mountain has this season paid all the expenses of working, besides leaving a nice margin.... Besides the mines mentioned, the Peck & Porter, Skookum, Chipmunk, Illinois Central, Belle Peck, Potosi, and perhaps others, will be worked this winter....

WAGONTOWN DIGGINGS.—Joe Cain reports plenty of water and 350 Chinamen at work.

ROCKY BAR.—Cor. of *Statesman*, Nov. 29th: At Atlanta City, John L. Tillman has commenced work on the "Stanley," formerly the "Lucy." This is the mine recently sold in London by Mattingly & Bishop. At Red Warrior, R. Thomas with a gang of miners will work the "Wide West." The Idaho mine is improving in richness and extent. The last run by Settle, De-

rick & Johnson, paid \$200 to the ton. There will not be an idle man in the county this winter.

BOISE COUNTY ITEMS.—*World*, Dec. 1st: The Gold Hill Co., on Granite Creek, are at work. Their tunnel penetrates the mountain 500 feet, and they intend to raise a shaft from the end, 250 feet to the surface and then stoop out the ledge; the ledge is rich in free gold, as well as sulphurets. The mill will run four or five weeks and then shut down until spring. Centerville is being rapidly rebuilt. The 20-stamp mill, lying up at the Gambrian lode, boxed up, just as it came from San Francisco, having never been put up, was sold, recently, by the owner, Col. Merritt, to Vantine & Co. It is surmised that they intend to erect it on the Banner ledge.

LOON CREEK.—*Boise News*, Nov. 26th: Fred Phillips, merchant at Leesburg and Ore Grande, reports mining still going on at Loon Creek, and that a very rich strike had been made just above town, on the opposite side of the creek; as high as \$70 to the pan had been got.

WARREN'S DIGGINGS.—Cor. of *Walla Walla Union*, Nov. 15th: Alexander McLane reports good diggings 10 miles south of Warrens. He says he thinks they will pay an ounce a day to the hand. Wood and water are plenty. Our quartz prospects look brighter than ever before. We have got a new "Richmond" in the field. Professor Eisenbeck, from Swansco, England, visited our mines last summer. The result was so very satisfactory to him that he has permanently located here. He declares this to be the richest camp that he has visited on the Pacific Coast. Rock which before yielded \$15 per ton, by his process yields \$40 to \$50. Messrs. Eisenbeck, Ball & Alexander have purchased the Rescue mine, and have leased the Pioneer Mill; they will commence crushing ore next week.

Montana.

ELK CREEK.—*Deer Lodge Independent*, Nov. 26th: We learn that there are seven companies still at work, all doing well. One company near the head of the creek have suspended for the season. One day last week a nugget was picked up on one of the claims that weighed eight ounces. Jones & Co. have struck gravel that pays \$10 per day to the hand. They have been working for four years with little pay, but have struck it at last.

PHILIPSBURG.—Capt. Plaisted, who has leased the Jas. Stewart mill, will soon have it in order, and being a "practical" man, will be sure to make a success of it.

Utah.

OPHIR DISTRICT.—*Salt Lake Tribune*, Dec. 3d: This district gives indication of fabulous wealth. Every day, fresh discoveries are made. Their are a number of clearly defined ledges already being worked, many of which are now shipping ore; among them are the Silveropolis, Silver Horn, Commodore Nutt and others, in which merchants of S. L. City, and Eastern capitalists are interested. We have before us an assay of four specimens from the "Great Eastern," owned by Reese, Cowen, Wells & Co., taken from the surface, as follows:—No. 1, horn silver, \$3,000; No. 2, black spar and chloride of silver, \$2,100; No. 3, black spar and chloride of silver, \$1,800; No. 4, \$500. These gentlemen state that one picked piece reached \$20,400.

New Mexico.

SILVER CITY.—Cor. of *Santa Fé Post*, Nov. 26th: "It is certain that here are deposits of silver ore, the richness of which is unquestionable, and the quantity of which, whether it lies in pockets or veins, is inexhaustible. The portion of the district in which the ore is most abundant extends over a space half a mile in width and running northeast and southwest for three miles. The work so far has been little more than prospecting. Shafts 10 or 12 feet in depth have been sunk, but no extensive operations undertaken. The ore assays \$1,600 to \$2,200 to the ton, and specimens have gone as high as \$3,500. Rich as it is, it sinks into insignificance beside a discovery made six months since in what is now known as the Chloride District, two miles from Silver City. We saw a specimen at Las Cruces which was pronounced by assayers to contain 90 per cent. of silver. A miner at Silver City took enough silver to make two large sleeve buttons from a piece of ore no bigger than a hen's egg. It is claimed that this chloride will average 85 per cent. of silver. One hundred pounds of ore, roughly reduced a few days ago by the old Mexican process, gave a plate of silver worth \$45. The gentleman who had it done has secured a mill site, and contracted with the miners in the vicinity to reduce 1,000 tons of ore for \$40

per ton. He will have a mill in full operation by next spring. Another party talks of erecting a 40-stamper. People are rushing hither from all directions, even from Ralston. Ore sells on the ground for one dollar per pound. Ten miles north of Silver City are the gold mines of Pinos Altos. These are said to have already yielded several hundred thousand dollars' worth. But little work is being done except in placer mining. The gold quartz is found in a range of hills one thousand feet above the level of Silver City. The richest is in the very tops of these hills. There are two mills at these mines, but they are not worked with regularity. A week or two ago a party of miners hired one of these mills for six days, and in that time took out eleven hundred and sixty dollars' worth of gold."

Mining Stocks.

SAN FRANCISCO, Thursday Eve., Dec. 8.

During the past week, the mining share market has been brisk and large sales have been effected, but there have been very considerable fluctuations in various descriptions of stock. Alpha has been sold from 8 down to 6. A number of shares of Amador have changed hands commencing at 245 and rising to 250. Belcher has been in brisk demand but has been very unsteady, ranging from 3¼ to 8¼. On the 2nd inst., the company levied an assessment of \$1 per share, delinquent January 5. Chollar-Potosi commenced at 76¼, fell to 69 and rose again to 78, with fair sales, and further to 91. The company received for November \$253,297; during the week ending last Saturday 1,940 tons of ore were raised from the mine, assaying an average of \$69.94. The company have declared a dividend of \$5 per share (amounting to \$140,000) payable on Saturday. Last July, and before then, the monthly dividends were at the rate of \$1 per share; in August they were \$2; in September, 2½; in October, \$3; in November, \$4; and this month they are at the rate of \$5. The stock has risen correspondingly from \$30-\$36 to \$70-\$80 last month. It is said that after paying the dividend for this month, there will remain a surplus of over half a million.

We noticed last week the rise in Crown Point from 3 up to 13. This week heavy sales have been effected. The rise continued from 13 to 16 on Friday last, but on Saturday there was a sudden drop to 9½. A telegram was received to the effect that there had been no strike in the mine to justify the excitement in the stock. On Monday and Tuesday the stock rallied up to 18, coming down to 13 on Wednesday, and selling to-day at 15½ to 16½. During November, the mine had 1,300 tons of ore crushed which yielded \$26,673.

Daney has been steadily rising from 4 to 5½. The new shaft is down nearly 300 feet, at which depth drifting is to be commenced in the direction of the old shaft, at the bottom of which very rich ore has been taken out. It is expected to strike the ledge 80 feet below the point where this ore was found. The shafts are about 200 feet apart. To these operations are ascribed the rise of the stock. On Thursday Empire Mill sold at 5. Golden Chariot has continued on the rise to 90 with fair sales. A telegram dated the 4th Dec., reports the discovery of exceedingly rich ore in the south end of the 3rd level. On November account \$61,950 have been received. Light sales of Gould & Curry and Hale & Norcross have been effected, the former at 75 to 80, the latter at 103½ to 105. On the 3rd inst., \$11,840 were shipped to this city from the Gould & Curry, which reports \$60,099 received on November account. The weekly report of the Hale & Norcross shows 1,128 tons of ore raised. This latter company have declared their regular monthly dividend of \$5 payable on the 10th.

The Eureka company have declared a dividend of \$10 per share, payable on the 10th, and are to hold a special meeting on the 3rd prox., to consider a plan of increasing the number of shares from 4,000 (at \$300 each) to 20,000 (at \$100), thus increasing the capital from \$1,200,000 to \$2,000,000. Ida Elmore sold on Tuesday at 12; the last sale was on the 19th ult. Ketchuck has sold from 41 to 35½. Quite a large number of shares of Mammoth have been sold at 25 to 33 cents. Meadow Valley has been brisk and steady at 24½ to 25½. The company pays their second monthly dividend of \$1½ per share (amounting to \$90,000) on Friday. North Star declared to-day a dividend of \$2 per share, payable on the 10th inst.

Ophir has been quite lively at 3¼ to 4¼. Original Hidden Treasure has been in good demand at 7½ to 9. In November, 280 tons ore were reduced, assaying \$36.72 per ton. The expenses during the month were \$13,300. Overman has sold from 5¼ to 6¼. The mine raised last week 525 tons of ore, most of it assaying \$30.65. On the 2nd, \$16,642 were shipped to this city. Savage reports 635 tons raised last week, averaging \$30.96 per ton. The stock was sold at 38 to 43. Silver Wave sold at 1 to 1½ on Tuesday, the first time it has been quoted for a long time. To-day shares were sold at 3. Compared with previous weeks, Yellow Jacket has been dull at 34 to 37¼. Sierra Nevada reached 20 this morning, the highest point for a long time.

Last month there were no sales of Bullion, Confidence or Gold Hill Quartz Mill, only one sale of Exchequer at \$5, and only a few sales of Occidental at 5 cents, on one occasion this last coming down to 1 cent, much below which point it is not very reasonable to suppose it would reach. Meadow Valley was one of the most popular stocks, advancing from 19 to 25. Chollar-Potosi also attracted considerable attention, rising from 71 to 84 and then ranging between 70 and 80. Golden Chariot commenced at 64 and closed at 72.

QUICKSILVER has advanced 33¼ per cent within six months, being now held at 80 cents. Concerning this the *Bulletin* says: It is to be regretted that an article of so much importance to the interests of this coast should be controlled by a powerful monopoly, able to put the price at any figure they choose to demand, as it must inevitably tend to reduce the yield of the precious metals. Many mines of low-grade ore, which could be profitably worked with quicksilver at 50 cents to 60 cents, cannot be worked without loss with the price at 80 cents. The reason given for this last advance is, that the product of the three principal mines (the New Almaden, the Redington and the New Idria) has so fallen off that the supply is not equal to the demand; and this to a certain extent, may be true. But it is generally understood that the product of at least one of these mines, which is capable of producing 1,000 flasks per month, is purposely kept down to about 300 flasks, because the owners are under a contract, which has still more than a year to run, to deliver their total product to the combination at 55 cents per pound.

The Date Paid to

By our subscribers is pasted on their wrappers, the last one or two figures represents the year. All are requested to send in the cash for a renewal of their subscriptions before their time expires. Don't wait to be notified.

After January 1st, THE SCIENTIFIC PRESS will be more specially devoted to MINING, MECHANICAL ARTS, INVENTIONS, AND HOME INDUSTRY.

Grapes and Fruit in the Upper Sierras

The dairy farmers in Sierra Valley, some 60 miles up the mountains, beyond Nevada City, and about 5,000 feet above the sea level, are making preparations to set out vines and trees in the valley the coming spring.

The first experiment at tree planting in that valley was made some five or six years ago by John Lipscomb. These trees have borne fruit for the past three years; but their cultivation has not been well attended to, and some of the trees have died.

The first vines were set out by Joseph Ence, about three years ago. These grapes ought to have borne the past season; but we have not heard whether they did or not.

The first regular orchard, containing a general variety of large and small fruit, was started by Mr. S. H. Herring, the agricultural correspondent of this paper, a year ago last spring. That orchard was set out upon Frank Lemmons' ranch, in the southern portion of the valley. This venture has also been very successful.

These repeated and successful experiments will no doubt operate to induce the general planting of trees and vines throughout this magnificent valley, which is about 35 miles in length by an average of six to eight in breadth. Three post offices have been established there, one near the southern, another in the center, and the third near the northern portion of the valley. These offices are named respectively, Sierra Valley, Loyaltown and Summit.

If proper care is taken in the selection of the right kind of varieties, this valley might be made the fruit garden of the mountains, and its orchards and vineyards become the most profitable investments of that kind in the State.

The kinds to be selected are such as ripen their wood and fruit early in the season, so as to be out of the way of the fall frosts. The wood of such trees readily endures the rigors of northern winters, while such varieties as ripen their fruit late, and continue to make wood until the near approach of winter, are not sufficiently hardy to resist the injurious influences of protracted and severe cold weather.

Probably some valuable selections of apple trees might be made from different varieties of Russian apples, elsewhere noticed, as now being distributed from the Agricultural Department at Washington. We have written to the Department to secure, if possible, a few of these to this coast, the result of which request we shall make known to our readers as soon as an answer is received.

The Best Kind of Cotton Seed.

EDITOR SCIENTIFIC PRESS:—Convinced from our pleasant interview of a recent date, that you are desirous of availing yourself of the most accurate and reliable sources of information related to anything that pertains to Cotton, and observing some errors in your issue of the 26th ult., in the statement of varieties of seed adapted to our soil, I have procured the enclosed letter from Maj. Jno. L. Strong, of Memphis, Tenn., now here. Major Strong is a planter on the Mississippi river bottom, who has done more for the true and scientific culture of the cotton plant than any other one Southern planter, Mr. Dickson excepted. He has secured land and plants one hundred acres, in this valley, the coming spring.

Yours,

J. M. STRONG.

Saelling, Merced Co., Dec. 21, 1870.

Col. J. M. STRONG.—DEAR SIR,—The variety of Cotton, of most value in the South for extensive planting, and adapted to every variety of soil and climate in the Atlantic Southern States, is the "Petit Gulf." There is no such thing as "Petit Gulf," as stated in the Report of the Cal. State Agricultural Society for 1865, and also in the SCIENTIFIC PRESS of Nov. 26, 1870. The Petit Gulf seed is an improve-

ment upon Mexican Seed. This improvement was effected by selections successfully made by the planters near Rodney, on the Mississippi River, in Mississippi. It derives its name from a small shipping point on the River, just below the town of Grand Gulf, known as Petit Gulf. This variety is the basis of all the improved varieties now in use, the most prominent of which are the "Dickson," "Palmer," "Moine" and "Johnson." The first (Dickson) is now the most popular improved variety in the South, deriving its name from the celebrated planter and writer on Cotton culture of that name. Mr. Dickson has produced stalks bearing 300 fully matured bolls. By careful selections for a series of years, any planter may improve his seed the method of selection you are fully apprized of.

In conclusion permit me to add, that I have never seen better developed nor more promising cotton, than that shown me to-day near Snelling. From the fact that visitors have rubbed the stalks of many limbs and bolls, it would be impossible to state what it will yield. I would safely say 100 pounds of lint cotton per acre.

Yours truly, JOHN L. STRONG.

Snelling, Cal., Dec. 21, 1870.

Eucalyptus, or Australian Gum Tree.

Wherever it has been introduced in this State, the Eucalyptus is surely becoming a universal favorite for forest, shade, street or ornamental planting. Its towering, upright habit and strength of growth; its nu-

merous branches and symmetrical bearing, and its magnificent foliage of deep evergreen, heavy, pendulous leaves elicits from all the highest meed of praise.

The accompanying engraving, furnished by E. E. Moore, nurseryman, 425 Washington street, shows a plant less than two years growth from seed, and presents a very perfect representation of a young tree. The third year a different set of leaves appear upon the new, upper branches, much larger and quite different in appearance from those of the previous growth as shown herewith. Thence and for years after, the curious feature is presented of two distinctly different sorts of leaves growing upon the same tree.

In Australia, its native country, the tree attains to the most magnificent proportions. We find it stated by the Government Director of the Botanic Gardens at Melbourne, that Mr. G. Kleim took the measurement of a Eucalyptus on the Black Spur, which was 490 feet high! That gentleman claims that to the Eucalyptus must be conceded the palm for height, though not for thickness, over the *Sequoia Gigantia* of California.

From hundreds of splendid specimens that we have seen in this State, we are constrained to believe that the Eucalyptus is at home in California, where it may yet rival the ancestral giants of its native Australian forests.

A Eucalyptus Forest in California.

Mr. J. T. Stratton has planted a forest of

some 40,000 of these trees on 50 acres of land, in Castro Valley, Alameda Co., consisting of the *E. Globulus* and *E. Gigantius* varieties. These trees are now about 10 feet high and very promising. Mr. S. designs to enlarge his forest planting until it includes all the standard American hard wood and nut trees. We believe that he is the pioneer forest planter on the Coast.

THE TIMBER OF THE EUCALYPTUS in Australia, is used for ship building, house building, fencing, and for agricultural implements, furniture, etc. Although it is very hard and strong, it can be easily split, while green, into clapboards, posts, rails, etc., and for fuel it is unsurpassed.

The bark of some varieties is said to be very rich in tannin, and is used for tanning hides in preference to other barks.

Medical Qualities.

We find the bark of the Eucalyptus highly spoken of as a medicine in fevers. As a preventive it is regarded as equal to quinine, without the injurious effects of that drug. It has been recommended as a desirable tree to plant in districts subject to the ague, as the peculiar, resinous effluvia exhaled by its leaves, is supposed to destroy the influence of miasma, in its immediate neighborhood. We are pleased to see so many planting this tree, as well as to notice the growing interest now felt in tree and forest planting generally.

Pruning the Eucalyptus—Seasonable Advice.

Unless planted in a very sheltered place, its towering growth soon exposes it to the winds so that it not unfrequently gets uprooted in winter, if not severely cut back. Its limbs and foliage also become more or less scattering, and its elegance disappears in a few years, if neglected in this respect. When the tree attains the height of 30 or 40 feet, if ornament and shade is desired, it should be thoroughly cut back in its top and leading branches. It will then throw out numerous fine branches and limbs, and present a dense and beautiful form. This advice will also apply equally well to the *Acacia*, another splendid Australia evergreen, which, when neglected, becomes straggling and sorry enough. With the proper training and treatment both these trees present an appearance unequalled for ornamental effect.

ADVANTAGES OF SECURING GOOD TITLES.

—The Nevada Gazette says:—When no man could get a title to a foot of land among these foothills, it was not worth while to embellish homes or plant trees, and men lived here as mere sojourners for a day, and talked of going home as soon as possible. They hardly acknowledged themselves in the United States, and to this day a horse of eastern parentage is called an American horse, as if California was part of Asia. But all this has changed. We now look upon California, not only as a home, but one of the most delightful on our Continent, and the day has arrived when they consider it necessary to plant vines and trees, and to embellish their homes. We shall soon have one railroad in our county, and before that is completed we shall have another. At an early day fruit will be in great demand among us, and we all feel that the day is not far distant, when the wine of California will be the wine of much of the world. All fruit is better as it climbs the hills, than it can be, when raised in the valleys; and nuts, one of the most profitable crops, can always find a market. Let homes be embellished by trees and shrubs and flowers, and home surroundings. Let vines and fruit and nut trees be planted as a rich inheritance for a future generation. Before they begin to yield a profit from the crop, they will double the value of lands, by their beauty and the prospective value of the crops to come. Those who plant now, will in two or three years be astonished to find with what little expense and trouble they have made a great moneyed speculation.

CHEAPENING BUTTER.—"Bone sweaters" is the name for men who gather up dead horses, and boil the carcasses to get the fat out of them, which is used to be sold to soap-boilers. The supply of this kind of fat seems to have so fallen off in New York that a committee was charged to investigate the cause. The report states that a better market is found for dead horses' fat among the cheap butter makers for New York.

CALIFORNIA QUAIL.—This beautiful specimen of the grouse family, which throughout our wooded hills, is now abundant, and, to use an eastern term, "as wild as a partridge," from fear and dread of the gunners art, is quite readily tamed and domesticated, when feeling no danger. In some of the private, sheltered grounds, about Oakland, where no shooting is ever allowed, they are so familiar as to feed with the chickens, and seem to expect their regular allowance of food. We could never find any pleasure in shooting these birds, compared to the satisfaction of seeing them seek the protection and friendship of men. The "noble sport" becomes wicked pastime when waged to the destruction of such innocent creatures.

ORNAMENTAL HEDGE.—THE LAURISTINUS

—On the beautiful private grounds of Mr. A. Campbell at Oakland, we were lately shown a young hedge of *Lauristinus*, two years old, which promises to be a fine thing. It was planted 2½ feet apart, and needs one year more of growth to become close, but is really pretty now. Mr. C. thinks—and so do we—that the *Lauristinus* will stand close clipping as well or better than any other shrub; indeed, it never shows to full advantage except under close training. It then presents a mass of fine foliage and flowers the year round unsurpassed for freshness and beauty in open ground.

TRADE OF SIERRA VALLEY.—The same

paper as quoted above in its issue of Nov. 23d, says: "Several of the farmers of Sierra Valley were in town to-day disposing of their dairy products, and purchasing supplies of groceries, fruit, and clothing of our merchants. Their butter sold readily at 45 cents a pound, and they expressed themselves well pleased with the price, and the reasonable rates at which they obtained such necessities as they wished to carry back with them. Besides groceries, fruit, etc., they have purchased quantities of grape cuttings, and small fruit trees which they intend to plant in their mountain valley, and try and see if they will flourish there. Sierra Valley is about 60 miles from Nevada, and 6,000 feet above the sea."

San Francisco Market Rates.

A NEW PLOW.—Mr. L. D. Gavitt, of Los Angeles, according to the *News*, has invented a new subsoil plow, which consists of an ordinary plow, such as is generally used, with a smaller plow of the same pattern directly underneath, and so arranged that the lower one can be readily adjusted and guided by the man who holds the main plow.

Household Reading.

Essence of Soup Herbs, Etc.

It is always convenient for the housewife to have at hand a ready means for flavoring her soups. The sprinkling in of crushed, dried leaves, etc., is, at best, but a barbarous way of arriving at the desired results, the importance of which was fully pointed out in a recent article, under the head of "Delicacy Essential to Food." The following preparation which has been highly recommended, can always be kept at hand for such purpose:—Take of thyme, winter savory, sweet marjoram and sweet basil—each one ounce; grated lemon peel and eschalots one half ounce each; bruised celery seed one quarter ounce, and alcohol one pint. Allow the mixture to stand two weeks, when it will be ready for use, and will constitute a convenient and very superior flavoring essence for soups, gravies, etc., without the presence of unsightly leaves and seeds floating around in the same.

ESSENCE OF SAVORY SPICES.—A most excellent preparation of savory spices, for many purposes decidedly preferable to "ground spices," may be made as follows:—Take of black pepper (ground), 4 oz.; powdered turmeric, 3 dr.; coriander seed (ground), 1½ oz.; oil of pimento, 1½ dr.; oil of nutmeg, oil of cloves, oil of cassia and oil of caraway, each ¼ dr.; and alcohol one pint. Mix and allow to stand two weeks, with frequent agitation.

ANOTHER.—Take of black pepper, 3 oz.; allspice, 1½ oz.; nutmegs and burnt sugar, each ½ oz.; cloves, coriander and caraway seeds (all ground), 1 dr. each; and add alcohol one pint. Mix and allow to stand two weeks, with frequent agitation, then press and filter. This is used when it is not convenient to get the essences.

When all the ingredients named cannot be conveniently obtained, a portion may be used, but not with such satisfactory results. Flavoring prepared after the above directions will be found very strong, and may be termed the "essence of savory spices" or herbs. A weaker preparation may be made by using the same amount of alcohol, with one-half the other ingredients; such a preparation may be called a "tincture of savory spices."

A preparation of this kind made in the kitchen directly from the spices and herbs named is much preferable to that purchased of dealers, which is too often made up of chemical and mineral compounds, not one of which, perhaps, has ever passed through a vegetable organism.

Potatoes and Beans.

Of all edible roots the potato stands at the head. It is especially useful to eat with lean meat—to which it stands in the relation of fat or carbon. Meat and potatoes together constitute about the same aliment as bread, on which alone, it is well known man can live longer than on any other food.

Potatoes when used with oat meal, peas and beans, supply all the muscle-making elements required for the laboring man—these three latter answering instead of meat.

All old California miners will recollect the exceeding great relish with which beans were eaten in 1849 and '50, before beef was plenty in the mines. They formed, with most, the chief staple of food. The miners of those days could scarcely have stood up under the hard work and exposure to which they were necessitated, if it had not been for their bean diet. It was thence they derived the nitrogen or muscle-making food ordinarily obtained from a meat diet.

The potato is almost entirely devoid of muscle and brain food—all that it does contain is found in the "eyes" or germs, and they, especially in old tubers, are generally cut out by the fastidious cook.

How to Reduce Corpulency.

Avoid all fatty or oily food, such as butter, gravies, milk; also all bread except that made from unbolted flour; avoid sugar and all kinds of sweet fruits; also beets, turnips, potatoes and rice.

The diet should consist as far as possible of lean beef or mutton, graham bread, acid fruits and such vegetables as peas, beans, tomatoes, cabbage (when boiled with lean meat) spinach and asparagus. Vinegar may be used as freely as it can be done without injury to the system generally.

The leaner or less oily kinds of fish may be eaten; but salmon and mackerel should be especially avoided.

Eat but twice each day, and that sparingly; take much out door exercise, and secure as much perspiration as is consistent with general health. Bathing and vigorous rubbing are good assistants. Avoid an excess of sleep and ill ventilated apartments. Abstain from ardent spirits and especially strong beer or "lager;" water slightly acidulated with good cider vinegar is the best drink which can be used. It will be better to avoid both tea and coffee.

SOAP ADULTERATIONS.—Soap may be made to contain more or less water, and some other ingredients, according to the manufacturer's desires more or less profit. Different kinds of hard soap vary in the amount of water contained, from 20 to 35 per cent. J. M. Willett's New York premium soap, lately analyzed in that city, was found to contain 30 per cent. of water and 20 per cent. of starch. The latter ingredient, whenever found in soap is an unmitigated fraud, as it has no property whatever of cleansing, nor does it enter into any of the chemical combinations required in the manufacture of soap, as is the case with water to a certain extent—about 20 per cent. Starch is used because it will hold several times its own weight of water. Other ingredients are sometimes employed in adulterating soap.

LARGE HEADS.—A general idea holds good, that large heads mean large intellects; that weight of brain indicates mental strength. But this notion is a false one. Man is inferior to some apes in the proportion which his brain bears to his body. When we come to animals the differences are very striking. To range a few of the commonest animals in the order of brain weights, we have the following descending scale:—Cat, dog, rabbit, sheep, ass, pig, horse, and ox. The cat has six times as much brain in proportion to her size as the horse has in proportion to his size. The pig has more than the horse, the sheep more than the pig. These facts almost set us wondering whether the brain has anything to do with the intellect at all.

DIFFERENCE BETWEEN THE ACTION OF CHLORAL AND OPIUM AND CHLOROFORM.—It is said that the action of chloral differs from that of opium and chloroform in the following respect: From the sleep produced by chloral one may be awakened at any time, with instantaneous command of all his faculties, and may then drop off into unconsciousness again. This is not the case with opium. Chloral does not effect the secretions, and is always certain and safe, when the dose is not excessive, even for children. This cannot be said of either, opium or chloroform.

DISINFECTING AGENTS.—Disinfecting with metallic salts, like chloride of zinc, or zinc vitriol, cannot be depended upon, since they simply deodorize, but do not destroy the miasma. Carbolic acid, its salts and compounds, are the only reliable disinfectants.

BAKED POTATOES MOST NUTRITIOUS.—Potatoes are more nutritious baked than when cooked in any other manner; and they relish better with those who have not been accustomed to eat them without seasoning. Wash clean, but do not soak them. Bake them as quickly as possible without burning in the least. As soon as they are done press each potato in a cloth so as to crack the skin and allow the steam to escape. If this is omitted the best potatoes will not be nearly so good. They should be brought immediately to the table, as they will soon become solid and lose their flavor.

Household Receipts.

POTATO FRITTERS.—For potato fritters, grate six cold boiled potatoes, add to them a pint of cream (new milk will do), and flour enough to make as stiff as other fritters, the yolk of four eggs, then the beaten whites, and a little salt. Fry in hot lard or butter. They are delicious.

BEER HASU.—Slice some cold beef, and some cold boiled potatoes, put an onion to a good gravy, either from the joint or stewed from the bones. Let the potatoes and beef simmer in the gravy. Add pepper and salt, thicken the gravy, and serve hot, with slices of toasted bread in the hot-tom of the dish.

TO "DO UP" BLACK SILK.—Boil an old kid glove (cut into small shreds) in a pint of water till the water is reduced to half a pint; then sponge your silk with it; fold it down tight, and ten minutes after, iron it on the wrong side while wet. The silk will retain its softness and luster and at the same time, have the "body" of new silk.

TO WASH BLACK CALICO WITHOUT FADING.—Put it to soak in weak suds made boiling hot; let it stand until cool enough to handle, then wash and raise in the usual way. For stiffening, use strong coffee or old ekim-milk.

TO DRIVE AWAY BED-BUGS.—An exchange gives the following as a sure way to drive bed-bugs from old bedsteads: "Take green tomato vines, put them into a basin or tray, pound them to pieces as fine as possible, then stain the bedstead where they inhabit, with pieces of vines, lay leaves under the ends of the elats." If this is practiced twice a year, not a bug will remain in the bedstead.

REMEDY FOR THE EAR ACHES.—The following is given as an excellent palliation for the ear-ache—one of the worst and most irremediable aches to which children are subject: Take a bit of cotton, put upon it a pinch of black pepper, gather it up and tie it, dip it in sweet oil, and insert it in the ear. Put a flannel handkerchief over the head to keep it warm. The application will generally give immediate relief.

Mechanical Hints.

FACTS ABOUT VARNISH.—A very warm temperature is exceedingly trying to the worker in varnish. When the thermometer stands at 90° to 100° the patience of the workman is severely tried. From 65° to 70° is the most favorable temperature for varnishing.

Frost is also another severe trial on the delicacy of coach and car or carriage varnish. If, on a frosty night, the fire in the paint-shop goes out, and the frost takes the varnish just at the point of setting, it will often produce most unsatisfactory results. The most common of these is "crimping" (or "enameling" or "eraping"). This consists of a peculiar shriveling of the surface, producing an effect similar to what would result from the pressure of crape upon the soft surface. The only remedy for this is to keep a steady fire in the paint room until the varnish is thoroughly set.

Frost will also sometimes bring out or "show" the grain on a finished panel. It has been stated, on good authority that frost has pushed the grain out through twelve to fifteen coats of paint, the night after being varnished, while another panel, as similar as could be, and treated alike, only kept from frost, remained perfect.

Still another effect of frost is its tendency to expand the wood, especially when the seasoning is not absolutely perfect.

To insure a perfect varnish job, use moderately three coats, observing in all cases that the brush marks flow out. It is particularly important that the first coat should be thin, as that is more liable to "crawl" or "pit" than the subsequent ones. The first coat should be applied as thin as will allow of its flowing out the brush marks.

WATER-PROOF GLUE.—Take one ounce each of gum sandarac and mastic, and dissolve in one pint of alcohol, then add one ounce of turpentine. Have ready a small pot of ordinary glue, to which a little isinglass is added, which is now to be gradually mixed and stirred into the first mixture—both mixtures must be hot; and immediately after being mixed strain through a piece of linen or fine sieve. It must be applied hot—it dries quickly and very hard, and wood united with it will not separate even when immersed in water.

PERMANGANATE of potassa will give white woods the color of walnut. Use warm solution.

Life Thoughts.

Men often blush to hear what they are not ashamed to do.

GREAT DIFFICULTIES, when manfully met, bring out great virtues.

GOOD-NATURE is a glow-worm, that sheds light even in the darkest places.

HAPPINESS is a perfume that one cannot shed over another without a few drops falling on one's self.

SUCCESS rises on the hour—grapple it and you may win; but without a grapple it will never go with you.

LUCK whines, Labor whistles. Luck relies on chance, Labor on character. Luck slips down with indigence. Labor strides upward to independence.

A HAPPY LIFE is made up of happy thoughts, and a man should be a very miser in hoarding, conscientiously, every mill of the treasure.

FORGIVING.—The power to forgive flows from a strength and greatness of the soul, conscious of its own force and security, and above the little temptations of resenting every fruitless attempt to interrupt its happiness.

GOOD AND POOR THINKERS.—Dull thinkers are always led by sharp ones. The keen intellect cuts its way smoothly, gracefully rapidly; the dull one weers its life out against the simplest problems. Next to a good heart and a clear conscience, is a clear head.

AVOID RASH SPEAKING.—They that speak without care often remember their own words afterwards with sorrow. They that expect peace and safety should restrain their tongues with a bridle.

THERE is no folly equal to that of throwing away friendship in a world where friendship is so rare.

Cheerful People.

God bless the cheerful people—men, woman or child, old or young, illiterate or educated, handsome or homely. Over and above every other social trait stands cheerfulness. What the sun is to nature—what God is to the stricken heart which knows how to lean upon Him—these cheerful persons in the house and by the wayside. They go unobtrusively, unconsciously, about their silent mission, brightening up society around them with happiness beaming from their faces. We love to sit near them; we love the expression of their eye, the tone of their voice. Little children find them out, oh! so quickly, amid the densest crowd, and passing by the knitted brow and compressed lip, glide near, and, laying a confiding little hand on their knee, lift their clear young eyes to those loving faces.

TEARS AND LAUGHTER.—God hath made both tears and laughter and both for kind purposes; for as laughter enables mirth and surprise to breathe freely, so tears enable sorrow to vent itself patiently. Tears hinder sorrow from becoming despair, and laughter is one of the very privileges of reason.

WISDOM AND PLEASURE.—If we apply ourselves seriously to wisdom we shall never live without true pleasure but learn to be pleased with everything. We shall be pleased with wealth so far as it makes us beneficial to others; with poverty for not having much to care for, and with obscurity for being unenvied.

SELF-HELP.—He who has not learned the lesson of resolute self-help has made little progress as a student, has grown little toward real manhood. Half the world refuses to do its own thinking, to toil through the solution of its own knotty problems; hence, half the world, who will not do this, must be subject to the other half who will.

OBEY YOUR PARENTS.—Show me the boy who obeys his parents, who has respect for age, always has a friendly disposition, and who applies himself diligently to get wisdom, and to do good towards others, and if he is not respected and beloved, then there is no such thing as truth in the world.

SILENT TEACHERS.—The silent influences of life are by far the greatest. We do not know at what moment we are stamping the character and coloring the whole future life of our associates by our voiceless examples or our most unpremeditated words. Many a father has poisoned the purity of his boy's soul by employing an unprincipled hand on the farm for a single season. It is not enough that your workman has brawny arms and is a good worker. Are his habits also good? If not, better let your grain fields rot on the soil than employ him.—Working Farmer.

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY. GEO. F. STRONG.
W. B. EWER. JNO. L. BOONE.
Office, No. 414 Clay St., below Sansome.

TWO EDITIONS.—We now issue a mining edition and a farming edition of the Press. The difference consists in changing the reading matter of the 6th and 7th pages [All advertisements appear in both issues, affording an immense circulation.] Subscribers will please notify us if they do not receive the edition they prefer. Both editions furnished to one address for \$7 per annum.

San Francisco:
Saturday Morning, Dec. 10, 1870.

Table of Contents.

Drying Foundry Molds by Hot Air, Ill.....333	Life Thoughts; Cheerful People; etc.....399
University of Cal.....404	Mining Commissioner's Report.....400
About Mootana.....394	California Embalming Process.....393
Lake County.....394	Work at the Fundries.....393
Cerro Gordo.....394	University of the Pacific.....400
MECHANICAL PROGRESS.....393	California Fish Ranch, Ill.....401
Laying Tracks; New Journal Box; Hoses; Tunnel; N. H. Locomotive Works; Peat Fuel; Street Car Construction; Benther Axle Box; Copying Drawings.....395	Earth Poring Auger, Ill.....401
SCIENTIFIC PROGRESS.....393	Formation of Coal Beds, Ill.....404
Natural Selection; Eager of Position; Eastern Earthquake Wave; Motion no Proof of Life; Disease Germs; Oxy-Calcium Light.....395	EXTRA CONTENTS IN MINING EDITION.....396, 397
FARMING AND GARDENING.....395	EXTRA CONTENTS IN FARMING EDITION.....396, 397
Fruit in Upper States; Cotton Seed; Australian Gum Tree, Ill.; Securing Good Titles; California Quail; New Flow; S. F. Market Rates; etc.....398	California Peas; Beet Sugar; Poultry for Profit; Agricultural Suggestions; Oats; California Agricultural Notes; Eastern Agricultural Notes; What I know of Farming; S. F. Produce Markets.....396, 397
S. F. Metal Market.....406	Shareholders' Directory.....397
N. Y. Metal Market.....407	S. F. Stock Market.....397
HONORABLE R. E. A. N. I. R. C. Essence of Soup; Potatoes and Beans; To Reduce Cornucopy; Soap Adulterations; Household Receipts; Mechanical Hints.....397	List of Patents.....404

Gold and Legal Tender Notes.

San Francisco, Thursday, Dec. 8, 1870.—Legal Tenders buying @90%; selling @91. Gold in New York to-day 110%.

Where to Get Cotton Seed.

It is presumable that many persons in the state, will desire to experiment in the growing of cotton, the coming season, on a more or less extensive scale; and we would recommend all such as desire to obtain the best and most approved seed, to apply to Mr. J. M. Strong, Snelling, Merced county. Mr. S. is agent for planters producing the several varieties named in the communication in another column under the head of "The Best Kind of Cotton Seed," and he will order, without extra charge for commission, at the following rates:

Dickson seed, \$5.00 (currency) per bushel, delivered on the cars and bills of lading taken.

Puler, same price.

Petit Gulf, \$1.50 (currency) per bushel, sacked and delivered on cars as above.

Orders, accompanied by the funds necessary to cover the amount desired, with name and shipping point, addressed to Mr. Strong, as above, (care of James Dale Johnson); or to Dewey & Co. of the SCIENTIFIC PRESS, San Francisco, will be forwarded at once and guaranteed pure.

THE SPECIAL AGENT and correspondent of the SCIENTIFIC PRESS, Mr. W. H. Murray, after having for several years traveled throughout the principal mining and farming districts of California, Nevada, Montana, Idaho and Utah, is now about to visit the Eastern States on the business of the paper. Mr. Murray has been unusually successful in making friends wherever he has been in the Pacific States and Territories, and his descriptive letters have been extensively read and copied. We hope that he may make as pleasant impressions in the Central and Atlantic States, and we bespeak for him a kind reception there from the many friends of our paper. He is duly authorized to make contracts for the SCIENTIFIC PRESS and the PACIFIC RURAL PRESS as fully and favorably as can be made in our own office.

Mining Commissioner's Report

Through the courtesy of Prof. W. P. Blake, we have been furnished with an early copy of the first issue of the report of the U. S. Commissioner of mining statistics. This forms a large octavo of over 800 pages. The report was transmitted to the Secretary of the Treasury last March, but such is the snail-like rapidity with which documents of the kind are printed and bound in the government office, that months may still elapse before the work will be fairly presented to the public. The delay is of course very vexatious to the author, who has nothing to do, however, in the circumstances, except to keep his temper.

Mr. Raymond has evidently "laid himself out" (if we may be pardoned the expression) in this book, and, we think, to advantage. He has not hesitated to call to his assistance efficient co-operators, and not only have we here valuable statistical matter, but also treatises on mineral deposits, mechanical appliances of mining, metallurgical processes, U. S. mining law, etc.; and the book contains much which has never before been collected and printed in the English language, so far as we are aware.

Mr. Raymond estimates the bullion product for 1869 as follows:

California.....	\$20,000,000
Nevada.....	14,000,000
Oregon and Washington.....	4,000,000
Idaho.....	7,000,000
Montana.....	12,000,000
Colorado and Wyoming.....	4,000,000
New Mexico.....	500,000
Arizona.....	1,000,000
All other sources.....	1,000,000
	\$60,500,000

"The falling off, as compared with 1868, is less than the severe drought, affecting the placer mines, the disastrous conflagration in three most important silver mines, and the trouble from miners' strikes would lead us to expect. In fact, the decrease in the placer product has been partly counterbalanced by an increased yield from quartz mining; and it is especially encouraging that the causes of decrease have been temporary, while the causes for increase have been such as to operate with augmented effect hereafter. I cannot but consider the prospects of our mining industry in the precious metals as far more promising than they were a year ago."

Mr. Raymond's attempt to collect certain statistics through blanks sent to miners, mill-men, etc., etc., failed. Out of 234 sets sent, answers to only 31 were received. To persons acquainted with the reserve of those connected with mining in our country as to publishing their private business, which they consider to be nobody else's business, this result is not so very surprising, and probably Mr. Raymond expected no very brilliant returns; had the attempt been successful, however, no private individual would have been harmed, while the public would have been benefitted. Yet Mr. Raymond has succeeded in collecting quite a large amount of valuable statistics, which appear to have been prepared with care, which is really quite surprising when we consider the limited amount of funds at the Commissioner's disposal.

In regard to the troubled matter of mining laws, there is a long letter from Hon. E. F. Dunne, of White Pine county, Nevada, which is very valuable in its treatment of the subject and in its suggestions. Mr. Raymond gives the draught of a proposed bill amendatory to the Act of July, 1866. We have no space to discuss the bill here. It covers some of the disputed points, but leaves others untouched. It proposes granting land of a width not exceeding 250 feet on each side of a vein or lode (but of the length of the claim it says nothing), with the right to all other veins or lodes within said tract. It would grant a patent covering an area of — feet for all deposits, except those in lodes, of gold, silver, cinabar or copper, and the right to all minerals within said tract, without the right to

follow the mineral deposit into the land adjoining. It contains sections providing conditions necessary to establish title, etc. One provision allows the payment of a sum of money (to be determined hereafter) to the U. S. Revenue Collector of the district, in place of performing 24 days of faithful labor upon the claim subsequent to the date of location and before a certain day of each year. Such are some of the points.

There are exceedingly interesting chapters (Part III) on mineral deposits. Mr. Raymond treats of various theories, although wisely committing himself to no one general one to apply to all cases. He rather favors the theory of the growth of nuggets in alluviums, a theory which has found some able supporters. While we would by no means deny the possibility of such growth, rather incline to it to some extent, yet we have our doubts also. The purity of such nuggets can be well explained by the action of water and air to which they have been exposed for long periods. In regard to size, we hear of large pieces of gold found in veins, and almost all the large nuggets unearthed have large amounts of quartz adhering or intermixed with them. The matter is still very unsettled. Mr. Raymond's treatment of mineral veins is also interesting.

Dr. Van der Wyde's chapter on wind as a motor justly calls attention to a force which has been neglected by those connected with mining, while it is a most promising subject. Part V treats of metallurgical processes and is an excellent addition to the book. Prof. W. P. Blake's article (Part IV) on the mechanical appliances of mining are an exceedingly valuable contribution to our works on mining, and are profusely illustrated. We shall refer to this more fully hereafter.

In concluding our hasty and imperfect remarks, we would again express our pleasure at Mr. Raymond's report. We hope that it will be widely spread among our mining districts, as it is replete with matter valuable to our mining community. As it is published at the government expense for gratuitous distribution, we hope that the details of the distribution may be so arranged that the object intended may be attained.

UNIVERSITY OF THE PACIFIC.—The commencement exercises of the Medical Department of the University of the Pacific were held at Mercantile Library Hall on Wednesday evening. A large audience was present and the affair passed off most pleasantly. Rev. C. H. Benson opened the exercises with a prayer, after which the degree of M. D. was conferred on Messrs. F. A. A. Belinge, J. B. Pilkington and C. Rowell. The *ad eundem* degree was conferred on Drs. H. M. Fiske, of St. Charles Medical Coll., Ill., A. S. Dubois, M. B. Pond and A. J. Younger, of the Toland Medical Coll., and C. P. Chesley, of the Vermont Medical Coll. Prof. W. H. Smith delivered the valedictory address on behalf of the Faculty, and Hon. Newton Booth, of Sacramento, made a very witty and pleasant speech which was frequently applauded. Rev. Dr. Thomas pronounced the benediction. The students of the Medical Department now number 25. The Faculty intend giving a course of Lectures this winter in addition to the regular course.

METROPOLITAN RUBBER HOSE.—Mr. J. L. Constable, 72 Montgomery Block, agent for the Odorless Rubber Co., of New York, has shown us specimens of a new hose for steam fire engines, mills, etc. There are two qualities: the 4-ply and the rubber-lined hose. The former has stood successfully a pressure of 400 lbs., and the latter 300 lbs., per square inch. The hose has the highest recommendations. It is said not to sweat, leak or rot, to be exceedingly durable and to pack so neatly that 1,500 feet can easily be carried on one hose reel. It is very light and in other respects has the best claims for notice from miners, farmers, mechanics and business men generally.

A California Embalming Process.

The Egyptians Outdone.

Some two years or more since, we made allusion to a process of embalming, invented and practiced by Dr. B. F. Lyford, of this city. At the time referred to, we were called upon to view, at an undertaker's room on Market street, the remains of Mrs. C. A. Ward, late wife of John B. Ward, of San Leandro, which had been embalmed by Dr. Lyford. The body, although it had lain freely exposed to the air for several months, did not exhibit the slightest evidence of decomposition. During the time which has since elapsed—some two years, or more—the body has been suffered to remain, as above, in an open casket.

A few days since we took another occasion to examine it, and found it still as we first saw it, the only change being a process of hardening, until the flesh has become as firm as horn or bone, and quite as hard, but more brittle. The chemicals employed in the process of embalming seem to have absorbed the juices of the body, and with very little shrinkage of the features, to have converted them into a semi-vitreous condition, in which state, with ordinary care to avoid excessive moisture or heat, there is every reason to believe it will remain through all future time, without the least perceptible particle of effluvia passing from the body.

Quite a number of intelligent and scientific gentlemen have examined the remains, and all bear testimony to the perfection with which the embalming has been done, and the perfect manner in which the features and expression of the countenance have been preserved.

Dr. L. has embalmed quite a number of subjects, and among others the remains of Mons. Pierre Bidcan, which were sent to his friends in Paris some two years since, and where the condition of the body attracted so much attention from scientific men and others, that space was given for it in one of the churches of that metropolis, where it was suffered to remain for public inspection some four months, eliciting general surprise for the natural and life-like appearance which it presented.

Dr. Lyford has practiced his art on quite a number of other bodies, in all of which he has met with corresponding success. Had the body of the late lamented General Thomas been placed in charge of Dr. L., the story that reached us of its condition, before it reached half the distance to New York, would never have been told; and the thousands of his friends and comrades at the East, who had so much desired to gaze once more upon the countenance of one they loved and respected so much, might have had their desire gratified, in a manner which would have left no unpleasant remembrance, save that the life-like form which they viewed had lost its consciousness forever. The process is as yet known only to the Doctor, and although apparently so perfect, he still hopes to further improve it before imparting his secret to the faculty and the world.

COAL, OYSTERS AND DIAMONDS.—In another column will be found a report of Prof. Le Conte's very interesting lecture before the Mechanics Arts College on the mode of formation of coal beds. The theory advanced then was very ably handled, but naturally full justice can not be done to the Professor's arguments in the condensed report to which we are limited. Still the report will give a very fair idea of the Lecture, and we think our readers will derive much benefit from our accounts of the series, in preparing which expressly for the Press considerable care has been taken.

In the Academy of Sciences, the matter of raising oysters in our Bay was treated, and if, as there intimated, the breeding of superior varieties can be successfully carried on, it will be a great gain for us. We likewise called attention to the finding of diamonds in Arizona, noticed in the report of the meeting of the Academy.

RECEIVED.—We have received from Prof. W. P. Blake, a number of additional reports of the United States Commissioners to the Paris Universal Exposition of 1867.

Patents and Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING NOVEMBER 29th.

MANUFACTURE OF ARTIFICIAL STONE.—William H. Foye, San Francisco, Cal.
RIDDLE FOR SEPARATING GRAIN.—Matthew M. Cooper and James W. Donaldson, Fairfield, Cal.

NEEDLES AND THEIR CARRYING-ARMS FOR SEWING-MACHINES.—Charles Henry Palmer, New York, N. Y., assignor to A. F. Sawyer, William H. Sharp, Jacob Rogensburger, Charles D. Carter and Mary P. Carpenter.

ANIMAL-TRAP.—Romano E. Wood, Santa Cruz, Cal.

APPLICATIONS FOR FOREIGN PATENTS.

Robinson Rutter, of Vallejo, Solano County, has made application for a British Patent, on improvements in the means or method of securing or locking screw-bolts and nuts. Dated 9th November, 1870.

Ernest von Jensen, of the city and county of San Francisco, State of California, has made a like application for a patent on "improvements in automatic lubricators."

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Patent Earth Boring Auger.

Our farmers often require some simple apparatus for boring wells, post holes and the like. The present invention is an evidence of the extent to which this want is

ORCHARD'S PATENT EARTH BORING AUGER.

felt. It is the result of practical working on a farm, the inventor being a practical farmer, who required a simple device with which he could bore successfully in all kinds of soils—in our mountains or valleys.

The auger is intended for wells, post and other holes, but the one here represented is the special construction for post holes. It consists of a hollow cylinder, having at the bottom two or more bits or cutters so arranged as to take the earth up into the cylinder, where it is packed and thus can be readily removed from the hole. The cutters may be made of one piece with the cylinder, or may be made separately and riveted on; their edges describing, when the device is revolved, a somewhat larger circle than that of the cylinder, thus enabling this last to turn without friction against the sides of the hole.

For sinking wells, the device is essentially the same, except that there is a peculiar arrangement for fastening together the different lengths of tube necessary to be added in deep boring.

The inventor has experimented long with his device and now offers it to the public with a feeling of satisfaction resulting from his own successful workings with it. It will easily bore the common hard-pan, which in many places occurs near the surface, enabling the farmer to set his posts far more solidly than he otherwise could do, and in a much shorter time, especially as here there is no necessity of sharpening the posts. It will act equally well in other soils. For well-boring when quicksand is struck, there is a portable valve in connection with the device, which can be used or removed at pleasure.

The mere looks of the invention, it is claimed, give no adequate idea of its capabilities. The inventor wishes persons to be eye-witnesses of its operations, which are the convincing proofs of its excellence. He is certain that he can demonstrate by working-experiments the superiority of his auger, and we therefore advise the numerous class of persons interested to either visit or apply by letter directly to him. A patent was granted through the SCIENTIFIC PRESS Agency in October of this year to Mr. Thomas Orchard, (of Lincoln, Placer county,) who is the gentleman to whom we have referred.

A California "Fish Ranch."

Our correspondent, W. H. M., sent us some time ago a description of the fish-ranch of the California and Lake Tahoe Artificial Fish Culture Company, which we here publish.

This company, J. H. Connor & Bro., have a fish farm about four miles from Truckee on the Truckee river. The situation is a most beautiful one, and the owners have taken advantage of the opportunities to make it a most charming spot. We pass up on the main road to Truckee until opposite their place, where we cross the river on a small bridge, and ride up to the house, situated in a grove of small pines, which give a pleasant and romantic appearance. The accompanying rough sketch will give a general idea of the grounds, the location of the ponds, etc., and render

FISH RANCH OF CALIFORNIA AND LAKE TAHOE ARTIFICIAL FISH CULTURE CO.

more intelligible the following description. The company, I may here state, commenced operations in 1867, and although without much previous experience in the business at that time, have yet been very successful in their experiment of raising trout.

Surrounding the grounds on all sides, except where the Truckee forms a boundary, is their main ditch (a mile long, two feet wide at the bottom, 20 inches high, and with a fall of a quarter of an inch to the rod) which takes its water from the river and conducts it to the various ponds, affording an adequate supply for all purposes.

The Ponds,

There are six ponds. That marked 1 in the cut is 75 x 50 feet and six feet deep. Here are the first fish raised by the company, which are three years old and will average 1½ pounds in weight. They number about 2,000, and visitors coming here are allowed to fish for the speckled beauties. These fish are fed on small minnows from Lake Tahoe. The pond is supplied with water from the main ditch through a trough, 10 x 20 inches, and from the further end of the pond is an exit down to the river, so that there is always a current of

fresh, pure water.

Pond No. 2 is 70 x 40 feet, six feet deep, and shaded in places to give the fish the dark retreats which they like. Here are some 8,000, now two years old, which were hatched from this pond. Pond No. 3 is a wooden tank, 12 x 30 feet, with two feet of water, holding 6,000 two year old fish which will average five inches in length. Pond No. 4 is 20 x 20 feet, and contains 10,000 trout, which are to be moved to a larger pond the coming winter. Pond No. 5 is 40 x 80 feet, and 10 feet deep, in which are 100,000 beauties. This pond is located 45 feet from the hatching-house, with which it is connected by a trough 8 x 6 inches. Through this trough a constant stream flows from the hatching-house to the pond, and by this the fish are transferred at the proper time. In the pond they are fed for the first time, and as they grow they are changed successively to the other ponds in the order intimated above.

The company collects the small streams flowing down the hills behind their place in a large pond, 70 x 80 feet, which they have built some 250 feet above the other ponds. This they have carefully constructed, having a heavy stone dam, 8 feet wide, of rough stone. In this pond the company, the first year, put all of the small fish as soon as they were moved from the hatching-house, 50 days after hatching; but they lost heavily by the operation, for the greater part of the small fry got into the interstices between the rocks, and large numbers perished. This showed the owners that a common earth-bank or planking is preferable for the sides of the ponds. The company propose now to raise minnows here for food. In the diagram, A is the house where the owners reside, B the hatching-house, and C the stables.

The Hatching-House—Hatching.

The hatching-house is 42x18 feet. In it are the hatching-hoxes, of one of which I send you a drawing. These hoxes are 12 feet long and 20 wide and are raised about three feet from the floor for the convenience of the workmen. They are divided up by partitions 18 inches apart, and the bottom is covered with a layer of gravel an inch deep. These partitions are simply bars, laid across the hox, which breaks somewhat the force of the current and create eddies, which are of advantage.

The water used here is not taken from the main ditch, as the purer water of springs is desirable. The water for hatching is taken from a spring, a quarter of a mile back of the ranch, and led through a box, 6x8 inches, to the hatching-house.

The temperature of the water in spawning season is about 45 degrees. The spring water is led into small tanks and thence to the hatching-hoxes.

The season for hatching in this locality extends from the beginning of May to the latter part of August, but the company do not attempt it later than July. They get the female fish each year at the spawning season and obtain the ova in the manner illustrated in the Press of May 7th of this year. After impregnating them (in the manner there described) the owners place the eggs in the hatching-hoxes on the gravel. The eggs are examined daily and all dead ones removed. When first hatched the fish have the form shown in the small cut, and as they draw nutriment from the large umbilical bladder, they do not require to be fed. But as the matter here is absorbed, they are carried over the bars, out of the boxes into the trough below (over a heavy fall, where they must get terribly shaken up, and out into pond No. 5, as before related).

Feeding the Trout.—Improvements. The company feed the fish with mutton liver and curds. The fish will thrive on

either but seem to prefer the former. Two livers, costing 12½ cents each, are fed daily, and thus the whole expense is only 25 cents for the whole lot of small fry. The larger ones are fed with minnows, as stated above. The liver is chopped up very fine and strained through a fine wire screen. Next year the company will experiment with a small lot, giving them curds only. It will be readily understood why it is impossible to let the large and the small fish remain in the same pond. The small fry would not remain there long if the proprietors wished it, for they would be devoured by their larger kindred.

In the winter, the ponds sometimes freeze over, but the proprietors assure me that the fish do not appear to suffer thereby. It is intended to make a large pond, 200 feet square and 12 feet deep, the coming winter, and the owners being old placer miners, propose to do this by hydraulic process, taking 200 inches of water from the main ditch and washing out the ground, letting the earth, etc., pass down into the river. Thus they can make their pond at a very small expense.

Etc.]

The fish hatched out are sold at the rate of \$40 per thousand when from six weeks to two months old. When older, the price is higher, ranging from \$40 to \$100 per thousand, at which last rate some sales have been made of fish eight months old. The largest ones sell readily here at 2½ to 30 cents per pound, and when only a few are taken, at 50 cents per fish. Quite an amount of fish have been taken by the farmers of Humboldt, Nevada, who have small ponds on their ranches, and who, I am told, are doing splendidly in this respect.

This company expect to raise from 100,000 to 200,000 next year. They propose to send specimens to the coming exhibition of the Mechanics' Institute of San Francisco, in 1871, and I can conceive of no more interesting exhibit than this.

The proprietors have been working with the greatest patience and energy during the last three years, have labored under many difficulties, have spent large sums of money, some eight to ten thousand dollars. They now have the prospect of realizing some returns, and I heartily wish them success. You have already called attention to the danger of our having our streams depopulated of the finny tribe, unless some preventive measures are taken, and to the possibility of farmers and others stocking small bodies of water with these useful and delicious fish. There is no doubt but that fish culture could be made most profitable in many places on our coast, and if the subject is not attended to now, it must be hereafter. The ova or the fish can easily be transported with safety. This company can send them in 20 hours from their hatching-hoxes or ponds to your city.

Messrs. P. Pingel and J. Hurley are building a fish pond near Lake Tahoe, at the mouth of Truckee river. They are now constructing spawning beds and ponds, having commenced operations on the first of September.

THE AMERICAN JOURNAL OF SCIENCE AND ARTS, the oldest of our scientific serials, closes its first century of volumes this year, and will hereafter be continued as a monthly, instead of appearing only six times a year. Its reputation has been of the highest, in accordance with its merits, and we rejoice at this intimation of its increasing success. Being the leading exponent of the views of our American Scientists, we can but wish it continued prosperity and an over enlarging influence, and recommend it to those interested in the growth of science in our country. It is published by Messrs. Silliman & Dunn, New Haven, Conn., at six dollars a year.

STAMP GUIDE.—Bolthoff's stamp guide, says the Colorado Register, is attracting a good deal of attention among the mill men, and is highly spoken of by some of the best judges of mill fixtures in the country. It consists of a guide-box to be gained into the cross-timbers through which the stem passes, having its interior diameter tapering toward the bottom. Into this box common hemp or cotton packing is stuffed, which is pressed down by a screw-follower, thus packing the box much as a piston-box is packed. As the packing wears, a simple turn of the screw sets the packing snug again, while the follower is quickly raised to admit more packing. The cost we hear but are not positive, is \$10 to \$22 per box. Once put in there appears no reason why they should not last forever. There is really no wear upon them or upon the stamp stem.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 511 Market street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phelan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock.

15v23m G. E. PHELAN.

MILLER & HALEY'S MILLS,

BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers.

BANCROFT'S NEW MAP

OF THE

PACIFIC STATES

California, Oregon, Washington, Idaho, Montana, Nevada, Utah, Arizona, British Columbia and Alaska.

Elegantly engraved on copper and colored in counties. Fifth edition, thoroughly revised and brought down to date 1870. It shows the Great Overland Railroad, also the proposed Northern and Southern Pacific Railroads and their connections; also all Railroads completed and projected in California and Oregon.

Upon the same sheet, on a less scale are the maps of Alaska, and a complete Railroad map of the United States.

No other map can compare with this edition in fullness of detail, and beauty and accuracy of its topography.

An enterprise of such magnitude and importance as this large and elegant copper-plate map, in order to be properly appreciated, should be in every office, school-house and dwelling. Those wishing an agency should apply immediately for terms, to

A. L. BANCROFT & CO., Publishers,
20v21-5t 721 Market Street, San Francisco.

A NEW PAPER FOR 1871.

—THE—

PACIFIC RURAL
PRESS.

A First Class Pacific States Agricultural and Home Journal.

Will be issued weekly on Saturdays, commencing Jan. 7th, 1871, containing sixteen pages devoted to

Agriculture, Horticulture, Stock Raising, Domestic Economy, Home Manufactures, Mechanics, Industries, etc.

With an able and ample corps of editors, special contributors and correspondents, we shall publish a liberal variety of articles, entertaining as well as instructive, which will not only make the RURAL PRESS an able assistant to its patrons, but an attractive and welcome visitor to every reader in every intelligent

Home Circle,

in the Pacific States. And more than this, we shall freight its columns with fresh thoughts, and new ideas, which hastened across the continent by rail, shall awaken and quicken the zeal of the more staid and gradual moving culturists of the eastern and European States, to their

Pleasure and Profit.

We shall not only make a good paper for all husbandmen and homestead owners, (who now, more than ever require a knowledge of new discoveries in science and mechanical improvements,) but shall also render the journal a desideratum for those who contemplate becoming freholders, and a large class of

Mechanics, Teachers, Students, Business, Professional and Trades Men,

whose interests are more or less identical with successful farming, and the active development of our vast and rich resources. Few there are—male or female—who will not find pleasure and emolument in the study of progressive farming and gardening.

Honest, intelligent and correct information will be faithfully given, in behalf of, and urging

An improved Cultivation of the Soil;
A greater Diversity of Products;
Better Breeds of Stock;
Better Varieties of Fruits;
The Culture of New Products;
Creation of New Home Industries;
Adoption of Improved Implements;
Higher and Happier Aims in Life, etc.

Valuable and Timely Hints,

will be given weekly to lessen the labors of the farm, the household and the shop, and add to the health, the wealth and the wisdom of every patron of industry.

How to Farm in the Pacific States.

As the conditions and circumstances of soil and climate and seasons on this coast are so peculiar that many of the approved methods of eastern agriculture are not at all applicable on our side of the Continent, special attention will be given to considering the need, extent and character of the modifications necessary. This will alone render the paper of great practical value to our home readers and more essential to them than all the distant publications obtainable, without such auxiliary and modifying instructions.

The following are among the specialties upon which the PACIFIC RURAL PRESS will treat:

Silk, Cotton and Sugar Beet Culture; Nurseries, Orchards, Tropical and small Fruits; Steam-plowing, seeding and harvesting for large tracts; Reclamation of swamp and unproductive lands; Hill and mountain farming; Grape growing; Fig, Raisin and Fruit drying; Irrigation; Lessons and Lectures on the chemistry of growing crops and on fertilizing lands; Practical Farming vs. Speculation; Taxation of unimproved lands; Railroads and improved transportation for crops and the better class of immigrants; Farmer's Clubs, lectures and associations; Co-operation in farming, mechanism, manufacturing and other industries; Government lands for settlers whether sold by R. R. operators or the U. S.; Reliable wholesale and retail market reports; Brief notices of Mechanical and Scientific Progress; Instructions for regular and farmer mechanics; Household Reading; Health and domestic receipts; a sprinkling of sprightly reading; Life thoughts; Poetry, condensed stories, items of news, etc., will be given.

A Plain and Simple Style

Of writing will be our endeavor. Necessarily dealing largely in researches for facts we believe it desirable to present them in an inviting shape and in so comprehensive language that our special journalism shall advance in popularity and common relish.

No editorials or selections of unchaste or doubtful influence, or lottery, quick or other disreputable advertisements, will be admitted into its columns.

Arrangement of Matter.

Our reports of agricultural, horticultural and other fairs, lectures, farmers' clubs and social literary meetings [the improvement and increase of which we shall especially advocate] will be carefully prepared in a valuable form for preservation; and the matter of our entire columns will be so classified as to be convenient to readers of various minds and individual tastes for ready perusal and future reference.

Interesting Illustrations of Pacific States and Eastern Inventions and Machinery, Fine Arts, Science, Fruits, Rare Stock and Natural Scenery.

Of special or peculiar interest to our readers will be published weekly in liberal variety. No pains or reasonable expense will be spared to furnish a

Large and Richly Filled Journal

Nicely printed on fine paper, which will favorably compare with the long established class journals of more populous fields and older communities. Although the latter have less opportunities than new communities to be benefited by printed information of discoveries,

And Neighborly Experiences,

the reading of agricultural newspapers and books is lately increasing with a rapidity quite astonishing, and with the most profitable results.

We enter the field after a careful consideration and consultation with many of our leading agriculturists, with the strong conviction that such a journal on this coast is greatly needed and earnestly desired by the most prospectively flourishing and rapidly progressing community in the Union if not in the world. We know the task before us,—two of the proprietors and editors having experienced respectively 18 and 13 years of successful journalism in this state.

Five Thousand Subscribers.

We shall print 5,000 copies of the issue of January 7th. That is the number of subscribers we hope to start with, having half that list already.

Advertising Rates Favorable

A select variety of advertisements only will be inserted. Circulated widely among the most thrifty of our population, the P. R. P. will be the cheapest and most effective medium for a large range of first class advertisements in the Pacific states.

Correspondence is respectfully solicited from every worthy source.

Parties desiring to get up clubs or act as agents, will be furnished sample copies and prospectus free.

DEWEY & Co.,

Publishers Patent Agents and Engravers, No. 414 Clay st., San Francisco. Nov. 21, 1870.

[Being also publishers of the SCIENTIFIC PRESS, we would say here that no change will be made in that paper except to improve it in its present character. Each journal will be published entirely distinct from the other.—D. & Co.]

THE MASONIC MIRROR

Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a

QUARTO-MEDIUM SIXTEEN PAGE PAPER

AND IS A FIRST CLASS

Literary and Family Newspaper,

AS WELL AS THE

Organ of the Masonic Fraternity on the Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by the M. W. Grand Lodge, F. & A. M. of the State of California, at its Annual Communication, October, 1870. Whereas, In the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,

Resolved, That this Grand Lodge, recognizing in the MASONIC MIRROR, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said Masonic Mirror to the craft generally as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the MASONIC MIRROR, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The MIRROR presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

AGENTS WANTED

FOR
Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever
published. It is not only a

COMPLETE ENCYCLOPEDIA,

Freshly written, and up with the times, but is also
a thorough and complete

Lexicon, a Gazetteer of the World, a
Biographical and Bibliographical, Legal
and Medical Dictionary.

And the only book ever published containing all these
subjects, with 2,000 Engravings. This really wonderful
work is to render readily accessible reliable information
on every conceivable subject. No human being could
be found to whom it would not prove invaluable. It
minutely describes every disease, flesh is heir to; ex-
plains every legal term or phrase; gives the geography
of the entire world; acquaints you with all noted men
and women living or dead; describes every country, city
and town; defines every word in use in the English lan-
guage; pictures the birth-place and gives portraits of many
distinguished personages; teaches the correct pronun-
ciation of proper names; is a biographical dictionary of
all nations; a biblical dictionary; describes every an-
imal known to exist; acquaints you with authors, scrip-
tors, travellers, warriors, painters, divines, historians,
naturalists, etc., of ancient and modern times; speaks of
all the battles and heroes of the late war; and explores
the whole vast vegetable kingdom.

Academy of Sciences.

Oysters—Diamonds.

The regular meeting of the Academy was held last Monday, Dr. Blake presiding. Prof. Davidson presented some specimens of oysters said to have been planted about six months ago from seedlings brought from the East. These show a remarkable rapidity of growth, having obtained a great size in this short time. Moreover, as far as known, none have been subject to the disease which has been so fatal to the oysters in the bay and which reached its maximum three years ago, but has since decreased. But even now in every lot of oysters, a coating can generally be seen on some of the oysters, this killing them. This winter will thoroughly test the matter, whether they can sustain the amount of fresh water resulting from the rains. A company has been incorporated for the purpose of raising oysters from seedlings of all varieties to be brought from the East. The specimens were raised in the Bay.

Prof. Davidson had seen two diamonds brought from Arizona by a party of prospectors, who had also collected a lot of rubies and quartz crystals. The latter they had taken for diamonds, while the real gems were preserved almost by pure accident. One of these will weigh about 4 carats and the other two. They are both of the first water, and the best one is estimated to be worth from \$500 to \$600. This occurrence of diamonds is most interesting and may lead to valuable results.

Variations—Meteorological.

Prof. Davidson made some remarks with regard to station errors, deflections of the plumb line, at various stations in the lower country. At Santa Barbara, where there are high mountains back of the town, the deflection is $7\frac{1}{2}$ seconds. At all stations the existence of such station errors is more frequent than their absence. At the Presidio it is $6\frac{1}{2}$ seconds; at Santa Cruz, over 10 seconds. At this last place there is this remarkable fact, that the deflection is not towards the mountains in the vicinity, but towards the deep submarine valley in Monterey Bay.

Dr. Blake made some observations on the connection of our meteorology with that of the Sandwich Islands. He had previously spoken of the corresponding barometrical changes occurring here and at St. Louis at a regular interval. Now he had noticed in several instances that there seemed to be a connection of the kind between the Sandwich Islands and San Francisco. The change would appear to occur about three days later here than there. Thus, a gale occurred there on October 20th; the barometer commenced to fall here on the 21st and reached the lowest point on the 24th.

Asphaltum vs. Borers—Earthquakes.

Dr. G. Hewston showed a very interesting specimen. It was of asphaltum containing *Pholadidea perita* in a natural state and evidently having been bored by the mollusk. Now it has been a very prevalent idea that asphaltum will prevent the inroads of boring mollusks. This disproves this idea.

Dr. Le Plongeon read the first part of his paper on earthquakes. He contended, and advanced evidence to prove, that the ancient philosophers were acquainted with the causes of earthquakes. We are by no means acquainted with the extent of the scientific knowledge of the ancients, many of whose works have been destroyed. He then took up, as his second point, the theory that the center of the globe is a mass of liquid fire, which he combated. The paper is to be continued.

Prof. Esmarck kindly consented to arrange the crustacea and other collections of the Academy. Dr. Hewston promising contributions in the hope of being able to get in time a collection typical of the coast.

A STEAM ENGINE FOR ONE DOLLAR!—The new toy for the coming Christmas, in New York, is a diminutive steam engine with boiler attached, which is made to turn a little driving wheel at the rate of one thousand or more revolutions a minute. The whole apparatus may be placed under a common sized goblet. It is sent to purchasers by mail for \$1.36, nicely packed in a box only four inches high by $2\frac{1}{2}$ in diameter.

Mechanic Arts College Lectures.

[Reported expressly for the SCIENTIFIC PRESS.]
Formation of Coal Beds.

Prof. Le Conte, in his fourth lecture, said that it has been shown that there could be but little question as to the vegetable origin of coal. But as to the mode of accumulation in the beds, the manner in which the immense quantities of coal have been stored up in their present positions, there is considerable room for dispute. Hugh Miller has estimated that all the forests of America, if changed to coal, would not make a deposit as large as the one Pittsburgh seam; and yet we have such a supply of this combustible in the coal-fields of the U. S., that even at our present very high rate of consumption, it will last at least 20,000 years. Now the question occurs, under what circumstances were these immense supplies laid up?

Some things are certain in this connection. We know that the deposits took place in connection with water. The preservation of the woody matter can only be accounted for on this supposition, as shown in a previous lecture in remarking on sub-aerial and sub-aqueous decay. Again, all plants of coal are swamp plants. Not only are the accompanying clays and sandstones stratified, that is, deposited by water, but the coal itself often presents distinct marks of stratification. The vegetable origin and the deposition in connection with water, we may then take as certain.

In regard, however, to the conditions under which our deposits have taken place, there are two principal opposing theories. Some say that it was done by the growth of plants *in situ*, just as the peat bogs are now forming. This is one theory. The other is that the deposits were formed by immense amounts of timber drifted by the water, as rafts are drifted by rivers and deposited at the mouths of streams. Let us now examine these two theories and see if we cannot arrive at some satisfactory conclusion.

The Peat Bog and Drift Theories.

We all know how, in some places, immense bodies of black carbonaceous matter are deposited as peat bogs, often growing in size so as to acquire a thickness of 30 to 40 feet. Such an amount as this would, perhaps, if compressed under proper circumstances, form a coal seam 2 to 3 feet thick. Let us now take a coal field and compare it with a peat bog and with the drift theory.

In every coal seam we have interstratified clays and sandstones, which agrees with what we find in peat bogs. The immense quantity of coal deposited can hardly be accounted for by supposing timber to have been drifted into place, as this would demand unreasonably large accumulations, while this is quite supposable in a peat bog if we allow plenty of time. We often find coal absolutely pure, i. e., with no more mineral matter than has been derived directly and solely from the wood. In drifts the accompanying mud would surely prevent the formation of pure coal, while peat often occurs pure. The almost perfect preservation of the most delicate portions of plants, so common in coal seams, is utterly unreconcilable with the idea of drift, but actually occurs in peat.

We have before seen that the leaves always occur in the black shale above, and between this and the coal seam. Now this relative position of the leaves is found also in peat bogs, but is not supposable in drift. The structure of the seams points in the same direction, these seams consisting of almost entirely apparently structureless matter, or with only microscopically visible structure, which often contains logs. Finally, and still more conclusively in favor of the peat theory and against the idea of drift, is the fact that with almost every coal seam, the under-clay is crowded with roots as they actually grew. Thus in the Nova Scotia fields, each of the 76 seams of coal has an under-clay with such roots, and over 20 have also stumps in the position in which they must have grown. In South Wales, 100 seams occur, each underlaid with fire-clay holding roots.

Thus far everything has favored the idea of the peat bog. But there is one strong objection to this,—the very frequent repetition of the coal strata, one above another, often up to a hundred times, and often with layers of marine (or ocean) formation. The only explanation, if we accept the peat theory, is a very violent one, viz.:—the repeated oscillations, or upheavals and subsidences of the level of the ground, and the constant plant growth directly over the previous bed. But the drift at the mouth of rivers explains this perfectly, as the sections of the deltas formed in such places show limestones (marine formation) alternating with fresh water sandstones and clays, and with layers of timber.

Combination of these two Theories.

If then each theory explains a part of the phenomena, no one separately explains all, but the two if combined would explain the whole, is it not possible to combine them? I think we can; and in this way: Coal beds were formed by the growth of peat bogs at the mouths of rivers. Let us see if facts will not sustain this theory.

The formation of peat bogs, as shown above, explains fully the formation of the various seams. Now it is also a fact that peat is now accumulating at the mouths of nearly all the great rivers. This idea is then exceedingly plausible. But can such a peat bog be free from impurities where it is subjected to periodical overflows of the river? Lyell has shown that it can, and is in the case of the bogs forming at the mouth of the Mississippi; for the overflowing water is strained and freed from its sediment by the thick underbrush.

Let us take an actual section of a peat bog at a river mouth. The accompanying diagram shows that of the one just alluded to,—at the mouth of the Mississippi. The bog has been explored to a depth of a thousand feet without finding bottom. But this section of a very small part is sufficient to give a general idea. On top, at *a*, we see the bog now forming with plants and trees; *b b* denote what were once similar peat bogs, now sunk below the surface; *c c* denote strata of clays and sand which have been deposited by the river; and *o o* denote limestones or marine deposits. Almost exactly similar bogs occur at the delta of the Po, to a depth of 400 feet; at the delta of the Ganges, to a depth of 500 feet; and at the mouths of many other rivers.

Now these regular alternations of peat beds and fresh water deposits, with here and there marine deposits, are easily explained. The peat forms on the surface which has a constant tendency to subside. If the level falls, the river raises the surface by depositing thereon clays, etc. Thus we have two opposing influences constantly at work, and the result is an alternation of peat beds and fresh water deposits. Now if the subsidence is very rapid and the surface falls below the level of the sea, the salt water overflows the land and we have a marine deposit, until the equilibrium is again restored.

In this way we can reasonably suppose our coal beds formed without taking for granted any circumstance which is not known to actually exist at present. An additional evidence for our theory is the fact that in coal beds we find drift timber just where we should expect to, on our supposition, viz: in the sands and clays above the coal seams. Here we have trunks of the pines, the upland plants of the period, which have been washed away by an overflow of the river and deposited with the sediment above our peat bed. Again, we find

in these clays all the marks of shore lines, as ripple and rain marks, footprints of the ancient animals, etc.

Application to our Coal Fields.

Now let us apply this combination theory to our great coal fields and see how it will answer. The lecturer here showed diagrams illustrating the portions of the continent which were above water at various periods. At the commencement of the coal period what is now the Appalachian coal basin was a fresh water lake, inclosed by land on all sides, but communicating with the sea at the south. Into this rivers ran, and a peat bog formed, and the conditions above given were continued until we have here our coal bed formed. In the Great Western and Central Basins, probably one originally, and separated by erosion, we have a similar case, only here was not an inland lake, but a swampy shore of immense extent. Hence we find here naturally a predominance of marine formations, while in the Appalachian, fresh water formations predominate. At the end of the coal period came the "Appalachian Revolution" of the geologists, which ended the Paleozoic period, rolled up the Appalachian mountains, raised the land and commenced a new era.

Taking the coal fields of the Jurassic period, we find similar circumstances. Formations of this period occur in Nova Scotia, Connecticut River Valley, New Jersey, Virginia and North Carolina. Here we had inland bays communicating with the ocean. At the north the land was so low as to be covered with salt or brackish water, and no plants could grow to form coal; but we find here the tracks of animals, etc. Towards the south, however, the conditions were more favorable, and the Richmond, Piedmont and North Carolina coal fields were formed. These have different plants from the above-named,—some ferns, but principally gymnosperms.

At the end of the Mesozoic era another upheaval occurred and our continent, before divided into two parts, was united into one. But certain spots were covered with fresh water lakes and thus were formed our Rocky Mountain tertiary coal beds, with plants still different from those of preceding fields, with forest trees predominating, many genera the same as now growing.

Estimate of Geological Time.

We have two methods of estimating the geological age of our coal fields,—by calculating the time it would take to accumulate our coal deposits, taking as our measuring rod the rate in which they are now forming; and by calculating in the same way the time necessary for the accumulation of the sands and clays.

According to Boussingault, the thickest forest vegetation collects about $\frac{1}{2}$ ton of carbon annually per acre, or about 1 ton of wood; or about 200,000 lbs of wood per acre in 100 years. This would give a layer of coal 6-10 inches thick over the acre, if all the wood were changed to coal. To form 100 feet of solid coal would thus take 200,000 years. But according to Bischoff, in

anthracite there is a loss of at least 5-6 of the whole organic matter, and in bituminous coal a loss of at least $\frac{1}{4}$. Taking an average, we will say that 1-5 of the wood is preserved. In this case then we must multiply our number of years by 5, and then we have a period of at least one million years to form 100 feet of coal *in situ*.

Now to calculate our sands and clays. We will take the Nova Scotia fields, as these afford the most complete reasons for the river delta theory. The original area of these was at least 33,000 square miles (now reduced by erosion to 18,000). The extreme depth is calculated at 3 miles in perfect section; we will call the average thickness $1\frac{1}{2}$ miles. This gives us over 50,000 cubic miles of sedimentary matter. We will take here the Mississippi river deposits as our measuring rod. Calculating from the amounts of sediment deposited at the mouth of this river, it would take at least 1,122,000 years to form the Nova Scotia fields.

The lecturer enlarged on this topic, meeting some of objections, to show that he had not over-estimated the time required, explaining how the erosive action and formation of sedimentary deposits is increased with the increased age of the world and the increased area of dry land, and declaring his estimates to have been stated, not as precise data, but in order to give some little conception of the immense lapse of time in geological history. These estimates were merely for the coal measures, which are but a part of the carboniferous period, which again is only a part of the paleozoic era, which finally is but one of the four eras (leaving out of account the present) of recorded history; and before this recorded history, we have still other ages, stretching back into the dim, unknown Infinite.

University of California.

The Regents of the University met this week and received communications concerning the Preparatory Department. The suggestion of Prof. Carr, of organizing the lower or preparatory classes in connection with the public schools in the various cities and towns of the State, is worthy, in our opinion, of mature consideration. We are opposed to the plan of having the University take direct and sole charge of the education of the youth of California where each education can be given in the grammar and high schools, as this is no part of a University's course. The rudimentary elements can be taught better in separate schools, and, moreover, the University is financially unable to undertake the huge task of teaching all the boys and girls of the State, having as much as it can do to instruct those desirous of studying the higher branches. It might be well for the Regents to explain what they consider a "University" to be.

Dr. Toland wishing to have his name prefixed to the title of the medical department, which would then be called the "Toland Medical Department of the University of California," and sending a communication with a condition to the transfer of the Toland Medical College building to that effect, the following resolution was adopted:

Resolved, That the resolution heretofore adopted by this Board, consenting to accept the conveyance of the building known as the Toland Medical College from Dr. H. H. Toland, be and the same is hereby repealed, he (Dr. Toland) having imposed as conditions of said conveyance that the Medical Department of the University should be called the Toland Medical Department of the University.

Mr. Hallidie presented the Mechanic Arts College with two handsomely bound books,—a register and a roll-call. The register contains the names of 500 students who have been enrolled. Mr. Hallidie stated that 80 students had applied for admission when any vacancies should occur. The lectures are a great success.

Prof. W. Swinton was elected Librarian of the University without salary, having consented thereto. The sum of \$500 was ordered to be placed in the hands of the President of the University for the payment of the expenses of the five free scholarships for the first term.

OVER a year ago, Colonel Paxton, of South Olive, Pennsylvania, lost a set of tools in an oil well he was boring, and never could get them out. The earthquake the other day gave that well a twist, and the tools came out several feet into the air.—*Ex.*

THE AMERICAN CHEMIST

EDITED BY

CHAS. F. CHANDLER, Ph. D., and W. H. CHANDLER.

TABLE OF CONTENTS

For September and October, 1870.

Articles:—

On the Analise at Coal-Tar Colors. By W. H. Perkins.
London was referred to the Sulphur Question.
Electric Deposition of Copper and Brass upon Iron. By W. H. Chandler.
Electroplating Iron with Copper and Brass. By W. H. Chandler.
The various Qualities of Sugar produced in Cuba, and the Different Modes of Manufacturing. By Edward Beanes.
Carbon Photocopy. By W. H. Chandler.
On some circumstances as to which have the simultaneous Precipitation of Alumina and Magnesia by Ammonia. By Laurence F. J. Winkler.
On the estimation of Ferrous Oxide in the Presence of Ferric Oxide in Silicious Minerals. By Charles A. Wilbur and Walter Whiteley.
The Nineteenth Meeting of the American Association for the Advancement of Science.
On the Temperature and Heating Powers of Flames. By W. M. Wain.
Experiments on the Effect of Alcohol (Ethyl Alcohol) on the Human Body. By E. A. Parkes and Chas. C. Wolf.
Composition and Quality of London Waters.
Hungerford-Krovetz. By C. F. Chandler.
Inspection of Milk in Massachusetts.
Chemistry of the Bessemer Process. By Lieut. C. E. Dutton.
Analysis of a Zinc Ore from Blair Co., Pa. By L. Preston Ashmead.
On the Precipitation of Metals of the Manganese Group in the Form of Oxides. By W. Ould Lelton.
Heterogeneous Mixtures. By A. Oppenheim.
Analysis of Deep Sea Water. By John Hunter.
On Animal Charcoal in its use in Sugar Refining. By Dr. Wallace.
On the Estimation of Peroxide of Manganese in Manganese Ores. By John Pattison.
Assay of Manganese Ores. By Edward Sherr.
Zinc and Sulphurous Acid. By E. W. Gibson.
Determination of Carbon in Steel. By W. D. Herman.
Presence of Potash in Chromite of Lead. By F. L. Philp.
Congelation of Bisulphide of Carbon. N. Y. Wartha.
Determination of Iron in Cast-iron. By J. Menz.
New Method of Heating stoneware Vessels. By J. A. Coffey.

Chemical Notices:—

From Foreign Sources, comprising 24 compact pages of Critical Notes on upward of 350 Chemical Papers which have been published in the last two months.
Recent Chemical Patents.
Brevettes.
Books Received.
Answers to Correspondents.
Questions from Correspondents.
Everything of value in the English Chemical News is reprinted verbatim for the benefit of our readers.
Single Copies 50 cents. Subscription per Annum \$5 in advance.

KUSTEL'S New Book.—We have received from the publishers, Dewey & Co., a copy of Kustel's work Roasting of Gold and Silver Ores. It abounds in valuable information upon the subjects which it treats, and no person engaged in mining should be without it. Mr. Kustel's writings are based upon actual accomplishments with the ores of the Pacific slope, are not mere theoretical propositions. Sold at the Scientific Press office for \$1. Price \$1.50 coin, post paid.—*Marysville Appeal*.

The Scientific Press is devoted specially to matters of machinery, inventions and processes pertaining to the development of mines, and gives free and full discussions of such matters. Terms, \$4 per year.—*White Pine News*, May 4th.

PAPER-BOATS.

Have been rowed by the winners of SIXTY races since their introduction in 1868. In January next, will be published our ILLUSTRATED CATALOGUE AND OARSMAN'S HANDBOOK FOR 1871, which in addition to containing fine wood cuts of our boats and latest improved models, will give

A complete list of all the Boat Rowing and Sporting Clubs in the U. S. and Canada, besides much other information of interest to oarsmen. Every one interested in boats or rowing should have a copy. For catalogues, circulars and price list, address

WATERS, BALCH & CO.,

303 River Street, Troy, N. Y.

NOTICE.

THE undersigned having completed arrangements through one of the first "Promoters" in Europe, for placing CALIFORNIA MINING SECURITIES ON THE LONDON MARKET, is now able to offer superior facilities for disposing of reliable mines of gold, silver or other minerals, as above stated. All properties given in my charge will be placed direct, without loss of time, upon the London Market, through a perfectly reliable party, long resident and entirely familiar with the business. Every advantage offered to parties owning shares in American mines worked by English capital, to dispose of the same. Advances made and ample security given when required.
GEO. W. SMILEY,
242-243-244 Montgomery St., San Francisco.

FORWARD! THE

SCIENTIFIC PRESS.

FOR 1871.

PRINTED ON NEW TYPE,

READING COLUMNS INCREASED,

Otherwise Improved in Value.

The success of our improvements in 1870, and the reduction of our subscription rates to \$4 per annum, resulting in a large increase of subscriptions, has induced us to make the above announcement. To afford

EXTRA INDUCEMENTS

To subscribers who will send in their names and cash for 1871, direct to the office previous to the commencement of the year we will, (during this month of December only) accept \$3.50 as full subscription for one year.

CLUBS AT \$3 PER ANNUM

for each name, will be received when ten or more persons co-operate in sending us their cash in advance. Don't hesitate. Forward your own individual subscription. No one knows the real value of the Press until they read it. Use your copy of the paper to induce others to subscribe. (If you like it yourself), and in subsequent remittance for a club, we will allow you the difference first paid above club rates.

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a brief description and statement of the productions of each county, besides the usual mining, agricultural and scientific intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer on this coast.—*Ver. Transcript*.

Mining and Company Advts.

Every Advertisement in this journal is published throughout its entire Mining, Agricultural, Monthly and Quarterly Editions.

Kincaid Fiat Mining Company, Tuolumne

County, California.

NOTICE.—There are delinquent upon the following described stock on account of assessment levied on the 20th day of Oct. 1870, the several amounts set opposite the names of the respective shareholders, as follows:
Names. No. Certificates No. Shares. Amount.
S. Card 10 10 25 00
S. Card 39 5 12 50
Wm. A. Quarles 15 10 25 00
Wm. A. Quarles 16 10 25 00
Ira P. Rankin 33 10 25 00
Ira P. Rankin 34 10 25 00
Ira P. Rankin 65 5 12 50
Ira P. Rankin 65 5 12 50
Wm. H. Sharp 35 10 25 00
Wm. H. Sharp 36 10 25 00
And in accordance with law, and an order of the Board of Trustees, made on the 20th day of Oct. 1870, so many shares of each parcel of said stock as may be necessary will be sold at public auction at the salesroom of J. C. McNeill & Co., 204 and 206 California Street, S. F., on the 3rd day of December 1870 at the hour of 12 o'clock M., of said day, to pay said delinquent Assessment thereon, together with costs of advertising and expenses of sale.
D. H. CROWE, Secretary.
Office 220 Clay Street, San Francisco.

KINCAID F. MINING COMPANY.—POSTPONEMENT.—The above sale is hereby postponed until December 17, 1870, at the same hour and place. By order of the Board of Trustees.
D. H. CROWE, Secretary.

Mahogany G. & S. M. Company.—Location

of Works, Silver City, Owyhee County, Idaho Territory.

NOTICE.—There are delinquent upon the following described stock, on account of assessment No. 1, levied on the 2nd day of Nov. 1870, the several amounts set opposite the names of the respective shareholders, as follows:
Names. No. of Certif. No. Shares. Amount.
George Hearst 24 1 10 200
M. Herman 20 200 400
J. S. Van Slyke 26 40 80
C. S. Muller 27 760 1520
A. L. Frank 23 50 100
A. L. Frank 28 3350 6700

And in accordance with law and an order of the Board of Trustees, made on the 2nd day of November 1870, so many shares of each parcel of said stock as may be necessary, will be sold at the office of the company, No. 2, Express Building, San Francisco, California, on Tuesday the 27th day of December 1870, at the hour of 1 o'clock P. M. of said day, to pay said delinquent assessment together with costs of advertising and expenses of sale.
Dec. 10-3w C. M. RICHARDSON, Secy.

Nevada Land and Mining Company.—Location

of Works: Steptoe, Johnson & Latham, Antelope and Clifton Districts, Elko County, State of Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of November, 1870, an assessment of four (4) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at his office, Room 5, 202 Montgomery street, San Francisco, Cal.
Any stock upon which said assessment shall remain unpaid on the seventeenth day of December, 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Saturday, the seventh day of January, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
WM. H. WATSON, Secretary.
Office, Room 5, No. 302 Montgomery street, San Francisco, California. nol94t

Providence Gold and Silver Mining Company.—Nevada County, California.

Notice is hereby given that at a meeting of the Board of Trustees of said Company, held on the 12th day of November 1870, an assessment of one cent per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary.

Any stock upon which said assessment shall remain unpaid on the 21st day of December 1870, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday the 5th day of Jan. 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.
J. M. BUFFINGTON, Secretary.
Office, No. 37 New Merchants Exchange, San Francisco California. nov19,

A Thankful Inventor.

PORTLAND, OREGON, Nov. 24th, 1870.—Dewey & Co.,—On reflection, it is thanksgiving to day, and I think it is my duty to write you a letter of thankfulness, for the trustworthy and business like manner in which you have attended to my business. Four inventions illustrated by valuable models, which I place in your hands, together requiring years of hard study, have been protected by valuable patents through your agency. Dewey & Co., are the only Patent Agents that I shall ever employ to obtain Letters Patent for me so long as I live, and I shall place in your hands more cases in your hands for protection. Again thanking you, I remain, Yours &c., THOMAS HILL.

SUCCESS IN BUSINESS.—Success in the business world usually depends upon being thoroughly prepared for its duties. Young men if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book Keepers. This school is connected with the International Business College Association, or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. F. HEALD, President, Business College, San Francisco, Cal. 242-243-244

SOZONOT.—All dentifrices had their drawbacks, until the sublimous Bark of the Soap Tree was brought from the Chilian valleys, to perfect the fragrant Sozonot, the most wholesome, reliable and delightful article for the Teeth that a brush was ever dipped into.

"SPALDING'S GLUE," always up to the sticking point.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 242-243-244 B. F. HOWLAND.

BLOCK TIN AND SOLDER WARE, broom wire, piano casing wire, etc., manufactured by Joshua Gray, 437 Brannan street. 242-243-244

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Stevenson street, up stairs. Stained, Oround and Ornamental Cut Glass to order on reasonable terms. 142-20

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your journal is very valuable. No better investment for \$4. Respect, B. O. B.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoa, but we do not doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homepaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Soluble Chocolate. Steam Mills Brick Lane, London. 624-21-1

THE PRESS is just such a journal as the people of this valley should patronize—it ought to go to every fire-side. It is devoted to the agricultural and mining interests, mechanic arts and general industrial progress. The subscription price is \$4, which, considering that the Press is one of the largest and ablest journals of its class in the Union, we consider very reasonable. Every business man of Bozeman, will we are satisfied, give Mr. Murray his name, and we hope such of our country friends as he interviews will be equally liberal. PICK & FLOW, MONTANA.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurates, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

SCIENTIFIC PRESS—three numbers—terms \$4 per annum—San Francisco. Constant improvements are being made in this publication. Illustrated mechanics receive liberal attention. Of late, an edition exclusively devoted to agricultural matters is issued simultaneously with that devoted to mining and scientific subjects generally. The growth of the paper and multiplicity of subjects embraced in the table of contents give evidence of an increased patronage and corresponding industry to maintain its high character.—*Colorado Herald*.

FOR SALE.—An account due this office for advertising for A. Jackson, of La Crosse, Wis., will discount 99 per cent, if necessary, 182-21-17.

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore." Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency, postage paid.

ROOT'S PATENT FORCE BLAST-ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1868.

Awarded the First Premium at the Paris Exposition.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Jarratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Aetna Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patented, W. T. & S. W. I. F. of Hudson, Michigan, their right in this mill, Patented Jan. 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this Mill a great quantity of wheat usually sown that has been cleaned in the common mills will be saved to the farmer, as the cut or shrunken kernels will never germinate.

The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and here away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day. No. 2 Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

THE WILSON

Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,

For Durability, Efficiency,

AND ECONOMY OF WORKING,

HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an ever increasing popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,

San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

Notice.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,

20v19-tf Supt. W. P. S. S. M. Co., Philadelphia.

THE

ASPHALTUM PRESSURE PIPE

COMPANY,

HAVING ERECTED A MANUFACTORY

of sufficient capacity to supply their Asphaltum Pipe in large quantities,

Are now Prepared to Take Orders

AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 643 Market street.

65 Circulars sent on application.

BLAKE'S PATENT

STEAM PUMP.

THESE PUMPS.

Have been tested, and found to be indisputably without an equal wherever tried. They are constructed in the most simple style, and built in the most thorough manner—especially calculated for SIMPLICITY, DURABILITY and POWER.

Some of the advantages of the Blake Pump may be summed up as follows:

It is POSITIVE UNDER ANY PRESSURE. May be run slow or fast as may be desired. Will discharge more water than any others of the same dimensions. Has no leaky joints, the steam part being cast in one entire piece. The steam valve is perfectly balanced, is cushioned at each end, and slides with the greatest facility, having no cams, nor complex rotary arrangements to get out of order. Will start at any point of the stroke, and will discharge all the water of condensation.

The Pump has no crank or fly-wheel, thereby saving a considerable item of expense to the purchaser. Having NO DEAD POINTS, it therefore needs no watching, and is consequently ready to start without using a starting bar or any hand work whatever. The Blake Pump is extensively used

On Railroads and Steamboats; in Hotels; for Mining and Fire Purposes; in Breweries, Tanneries, Sugar Houses, Factories, Mills, Laundries.

And as BOILER FEEDERS, wherever steam is employed. In fact, wherever water or other liquids are desired to be raised in large or small quantities, or against heavy or light pressure, it is the

Cheapest and Best Pump that can be Used.

It is offered to the public as the most perfect independent Steam Pump ever invented. FORTY DIFFERENT SIZES are made, capable of throwing from 1,000 to 200,000 gallons an hour, and adapted to any class of work that might be required. For sale by

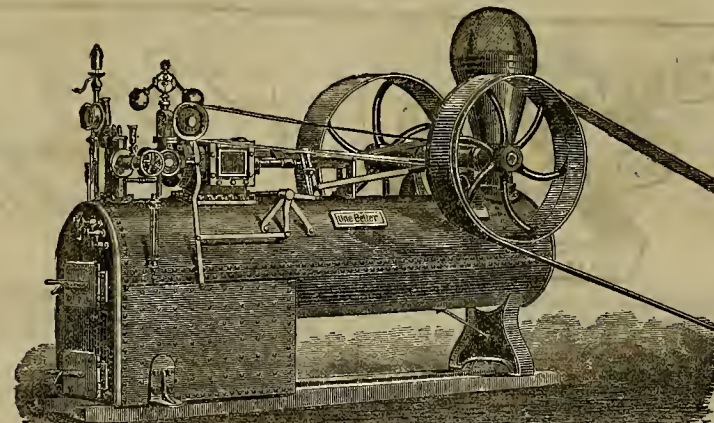

BERRY & PLACE,

112 and 114 California Street, San Francisco.

Every pump will be warranted to perform the work required of it by the purchaser, or it may be returned and the money will be cheerfully refunded.

Awarded a SILVER MEDAL at last Exhibition of Mechanics' Institute, San Francisco, and State Fair at Sacramento, as being the Best Pump on Exhibition.

HOADLEY'S PORTABLE ENGINES!

3 to 20 Horse Power on Carriages and Beds.

These Engines are in use all over the United States, and are regarded as the best in use. They are self-contained Engines, without the running gear and appurtenances, for driving

Saw Mills, Grist Mills, Tanneries, Machine Shops, Planing Mills, Factories &c., and for all other purposes under seventy-five horse-power, to which Stationary Engines are applied. For Agricultural uses they are unsurpassed. For Circulars or pamphlets, describing dimensions and price address

STEAM JET PUMP.

Blakelock & Williams' Patent, for Water, Oils, Acids, Etc.

The best COLD WATER pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

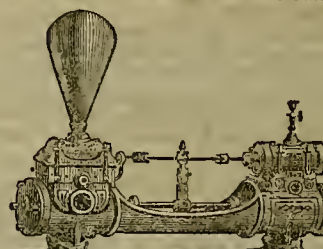

We ask the attention of all proprietors of steam power to the following points of merit—it is operated by steam taken directly from the Boiler into the Pump; It has no valve or wearing parts of any kind; It requires no bolts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Safe friction guaranteed or the money refunded.

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and actors for themselves, at the office, 229 Fremont Street, San Francisco.

225 Bush Street, San Francisco

23v21-1m

The Scientific Press is devoted specially to matters of machinery, inventions and processes pertaining to the development of mines, and gives free and full discussions of such matters. Terms, \$4 per year.—White Pine News, May 18th.

California Agricultural Notes.

AT A HANDSOME PROFIT.—Some late shipments of California brandy, which cost \$2.50 delivered in Chicago, was sold readily there for \$5 per gallon.

WILLIAM WOODWARD, the Napa vine-grower, is about engaging in the manufacture of champagne. He has secured the services of a native of the Champagne district, of France.

WILD HONEY.—Large quantities of honey are being brought into Los Angeles from the wild swarms of bees in the mountains to the east of that city. One party of bee hunters recently brought in over 1,000 pounds of clear honey, the proceeds of a single trip.

ANOTHER BEET SUGAR FACTORY.—It is said that Flint, Bixby & Co. will shortly erect a beet sugar mill on their farm between San José and Hollister.

BEET SUGAR IN OREGON.—The Oregonian says that measures are now in progress for establishing a beet sugar factory in Portland or its vicinity. We have already noticed the fact that one is about to be started in Salem.

BANANAS IN SAN GABRIEL.—Mr. Davis of San Gabriel, in Los Angeles county, is growing bananas with excellent success.

THE average consumption of wine in California is ten gallons to every citizen. The average yearly consumption of coffee in the State is 16 3-5 pounds.

JUST IN TIME.—Just before the late rains it was reported that the live stock about the Bay and in many parts of the interior valleys was beginning to suffer severely. The old grass was pretty well used up, as the previous rains had not started the new.

CAN WE GROW CORN?—About 25 tons of corn in the ear have arrived at Reed's Landing this season, from a single farm in Calaveras county. It is used to feed hogs. We shall buy our pork from Reed's Landing.

B. N. BUGBY, the well known vinecultivist, of Folsom, has lately returned from a short visit to the East. During his absence he has disposed of a large amount of the product of his vineyard, and has orders for more.

WOOL, WINE AND SALMON.—The steamer Sacramento, which sailed for Panama on Saturday last, had among her cargo 164,000 pounds of wool, 500 packages of Oregon Salmon, and 2,700 gallons of California wine.

CALIFORNIA SILK FOR THE EAST.—Mr. Joseph Newmann, the silk man, shipped, a few days since, the first bale of California grown silk ever sent to the Eastern States.

The Oakland mill is now turning out 200 grain sacks per day, and gives employment to 70 persons.

Eastern Agricultural Notes.

SCYTHES.—The old-time "scythe" does not seem to be entirely laid aside for the more costly machine mowers; as it is stated in an Eastern journal that there are not less than 1,500,000 of these implements manufactured in the United States every year, at a cost of about one dollar each.

FEARFUL OF THE RINDERPEST.—Stringent measures have been taken to guard against the introduction of rinderpest from the Continent into Great Britain. Among other preventive measures, all cattle from the Continent are to be slaughtered immediately on their arrival at any English port. No wine packed in straw is now allowed to come from Germany, where this disease is prevalent.

APPLE SEEDS are worth from five to six dollars and fifty cents per bushel, dry and clean, in the vicinity of Dansville, N. Y.

PREMIUM FOR FOREST TREES.—In Nebraska, every acre of transplanted forest trees exempts \$100 from taxation. A wise provision which it would be well for California to follow.

The harvest in Germany this year has been mostly gathered by the women, assisted by the men too old to join the army, and by children.

THE FRENCH AGRICULTURAL SOCIETIES have put off all their meetings, as the whole force of the country is required for its defence.

FARMERS CLUBS IN MAINE.—One-quarter of the State aid for agriculture in Maine is now used for establishing and sustaining local Farmers' Clubs, and one-fourth to encourage wheat-growers. As a consequence Farmers' Clubs are rapidly increasing in that State, and four times as much wheat as usual was grown there in 1870.

WIESTER & CO., No. 17 New Montgomery Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

This device is just what its name indicates. As a Kitchen Tool it is indispensable. It will fit and lift with perfect safety, any Stove Lid, Frying Pan, Pie Pan, Pot, Kettle, or any other vessel or dish used about a stove. It is a complete tool for stretching carpets, driving tacks, pulling tacks, &c., &c. It answers the double purpose of hammer and pincers, and is also a good Nut Cracker. It is made of the best malleable iron, and the Hammer, Pincers and tack puller, are all hardened so as to stand the roughest usage. An Agent is wanted in every town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

Simonds Patent Collar Stud.

Every one who wears a "Butterfly" tie, knows well the vexation incident to fastening the loop of these ties over the common collar stud or shirt buttons. This stud while serving every purpose of the common article makes this task as easy as hanging ones hat on a nail. The loop slips readily into the slotted hulk, and cannot escape by accident, thus preventing the loss of the tie; now so common. They are well plated with gold. It is very seldom that a patent is offered which affords a larger profit than this one. Parties buying the right to a town, county or state, will be furnished with the studs at what they cost to manufacture. A sample will be sent to any one by mail, on the receipt of the retail price, fifty cents.

Improved Construction of Roofs for Tobacco and Fruit Drying Houses.

Persons who are interested in the drying of fruit or tobacco, can fully appreciate this new and useful invention. The object of the invention is to construct the two inclined sides of the roof of a Tobacco or fruit-drying house, so that the sides can be easily and quickly thrown into a vertical position, so as to expose the fruit or tobacco to the drying effects of the sun and air. By the use of this simple device, the labor and expense of handling the tobacco leaves, and changing them upon the racks, is avoided. In California and Oregon, this invention can be used to great advantage in fruit drying. In time of rain the sides of this roof can be almost instantly lowered to protect the fruit from dampness. This invention has been recently patented by M. de K. Cutts, of Richmond, Va., and a full set of drawings, and Letters Patent, can be seen at our office. Here is an opportunity for a profitable investment, as we are authorized to dispose of Rights at very low prices. Full particulars can be obtained from any of our travelling agents, or by calling at our office.

NEW HOSE COUPLING.

This coupling is one of the most useful and perfect inventions of the day. It can be joined almost instantaneously and answers equally well for gas or water hose. Call and examine samples. The Right, to any town or city on the coast, will be sold at a reasonable price.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

Boating—Paper Boats.

The idea of trusting one's precious self on water with only a sheet of paper to sustain the body, would have seemed most absurd no very long time ago. But the increasing interest in boating, the ever quicker time made in races by oarsmen, and the necessity of having the lightest boat possible, have at last familiarized us with the idea, which the skill of the builders has made an established fact.

The first paper boat which we remember to have seen, was exhibited at one of the fairs of the Sanitary Commission held in a large city at the East during the war. The fragile thing, when tried, performed suc-

cessfully its intended mission, but immediately curled up when taken out of the water and allowed to dry. Since then, however, other paper boats have been made and have been shown to be as durable as the thin wooden shells, when properly cared for. During the last two or three years, these boats have been quite generally used for racing purposes at the East, have been subjected to a variety of severe tests for speed, strength and durability, and have endured these tests so well that their manufacture has now grown to be an important business. A large firm, Messrs. Waters, Balch & Co., of Troy, New York, deal very extensively in them, and we are enabled to present our readers with representations of two kinds of the racing boats turned out by these gentlemen.

The skin and decks of these boats are made of the strongest paper which can be manufactured, molded into the model desired on solid forms of wood, supported and kept in shape by a framework of light wood, supported and finished with fittings of wood and metal in the usual manner. The paper skin is prepared with hard varnishes, and presents a solid, horny and perfectly smooth surface to the action of the water, unbroken by joint, lap or seam from stem to stern. This surface can be polished as smooth as a mirror if desired; it cannot be cracked or split like wood; and no ordinary degree of heat or cold, it is said, affects its shape or hardness. With paper, lines can be produced which are unattainable with wood, unless the boats are worked out of the solid material. The boats are provided with air-tight compartments, to increase their buoyancy, and as the cockpit is only large enough to accommodate the oarsman, but little water can be shipped,

while no water can leak in through seams, from the fact that there are none. In the boating season of 1869, the boats were used by the winners of twenty matched races. Being painted and varnished, they cannot be distinguished from cedar shells at a short distance.

For the benefit of hunters, the firm alluded to make a paper hunting skiff, 15 feet long by 36 inches beam, and weighing 65 pounds. These, being so light, can be easily propelled through the water or carried over portages, while they are sufficiently strong and steady for all ordinary work. They afford ample room for traps and equipments and are remarkably dry in roughwater.

To those who have witnessed the glorious scene of four- or six-oared shells flashing

splendid corrugation of biceps and deltoid, as he recedes down stream. Still better is it to stand by the well-known bath-house on Charles Street, on a fine afternoon—June 17th or July 4th—and watch the great shells taking their places in the line—backing, turning, or going ahead with the precision of clock work, at the low word of command from the captain, as if the boat had eyes in her bow, and feelers in her six long antennae,—and then at the word “go” to see the sharp mahogany beaks shoot out from the line, the row of six half-naked figures, capped with blue, brown, white or magenta, working steadily and swiftly back and forth with the resistless swing of some powerful engine, and the water flashing up in diamond spray at each stroke of the gleaming spoon blades, while from bank,

The Australian Subsidy.

The Chamber of Commerce of this city have determined to petition Congress to pass a law containing all the provisions of the bill on this subject introduced into the Senate last March, by Senator Cole. In the Memorial adopted by the Chamber and including this petition, are statements of exceeding interest, showing the importance of having a subsidized line of steamships from here to Australia. The population of the colonies in 1869 is given as 1,949,929; value of imports, \$180,205,427; of exports, \$175,834,571; of tonnage cleared, \$2,075,256; number of vessels, 7,190; gold exports of New Zealand, \$13,816,253; of the other colonies from 1851 to 1868, \$651,140,330. The value of articles imported directly and

PAPER SIX-OARED SHELL.

through the water in living competition, the oarsmen in full exercise of their powers keeping perfect time with their swaying bodies and swinging blades, there are few sights more pleasantly exciting. To those who have taken part in such a race, have felt their muscles strung to their fullest pitch and changed to steel, their whole force concentrated to put one more pound

and wharf, and crowded river, and judge's boat goes up one mingled roar of manly sympathy and generous applause! Yes, decidedly, dear cousin from the rural districts or elsewhere, who have hitherto failed to see a good regatta, don't miss the next chance, on Charles, or Hudson, or Quinsigamond,—go and get a good place and see it through, and my life on it you

indirectly from the U. S., or from countries unable to compete with the U. S. in their manufacture, is set down as \$43,164,174; but the articles exported directly from us have a value of only \$4,619,313. The population, in 1868, of Polynesia, (which would be brought into direct and exclusive communication with San Francisco, if the proposed line be inaugurated) is given as

540,000; imports, 1868, \$4,566,600; exports, 1869, \$3,958,358. The memorial cites many of the advantages which would

PAPER SINGLE SCULL.

on the oars, have heard the cries and yells of encouragement from a thousand throats, have had their strength all but gone and then somehow renewed, and received their “second wind,” have felt by some sympathetic power (not of the eyes which can see but the broad back before them rising and falling in one steady monotone) that the sharp bow beside them is slowly but surely falling to the rear, and who have finally come in victorious in the noble contest of skill and strength,—to such the sight even of the graceful, delicate shell is tinged with the brightest colors of rich memories. To those who have never viewed such a strife, let us repeat a few words of a writer in the *Aldine Press*.

“You should manage to be on Cambridge draw-bridge some fine afternoon when the single-sculls are out for practice, see the odd animal rapidly growing larger on the view, looking, as it comes down the river—end on, and so showing no boat at all—like a great mosquito or daddy-longlegs in a state of convulsions; then see the exquisite proportions of the graceful creature as it shoots through the draw beneath you, just missing the pilcs on either side with the tips of its sculls, and then watch the long regular swing of the oarsman's body and

will agree with me that it is one of the prettiest sights yet to be seen in these stockjobbing times.

“The one good thing left in evil days.”

FILE WORKS.—The business of re-cutting old files must be increasing considerably on the coast, as a third establishment for this purpose has been recently opened in this city. It is located at 311 Mission street, and is styled the Eureka File Works. T. G. Durning is superintendent. Mr. D. is a pioneer in this line, having established the Pacific File Factory, with which he was for many years connected.

BLOSSOM ROCK.—The work on Blossom Rock has finally been accepted by the Government, and Col. Von Schmidt has received his \$75,000. The Colonel leaves for the East soon, where it is reported that he will be engaged by the Government in the operations at Hell Gate, New York Harbor.

NEW OCEAN CABLE.—The New York and London Direct Telegraph Company is the name of a new association which proposes laying an ocean cable from Rhode Island to Wales. The company is organized in London, with a capital of \$3,200,000. Five of the twelve directors are Americans.

EARTHQUAKE.—The bark Amethyst, from Bellingham Bay, reports that on December 4th, near Cape Mendocino, bearing E. N. E., distance 45 miles, felt a severe earthquake shock. The wind at the time was fresh and from the south.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

All About Montana.

[Continued from page 394.]

The Mineral Resources.

The mineral resources of Montana are but just touched on. The first seekers for gold found the placers of Bannock City in 1862. Alder Gulch, discovered in 1863, drew thousands of men; and from these recent dates the territory grew up.

The number of gulches worked, up to the end of 1868, is given as 134, making 475 continuous miles of gold diggings. Besides these, the Crow Creek diggings comprise an area of over 25 square miles. Nine-tenths of these will pay \$6 a day in gold to the hand and some over a hundred. More than once a thousand dollars to the panful of dirt have been obtained in Confederate Gulch, and over three hundred in McClellan Gulch. These are facts, says the *Statistical Almanac*, on whose authority they are given, and which gives also the following:

PLACER YIELD UP TO 1869.

Lewis and Clark county.....	\$19,360,000
Meagher county.....	6,949,500
Deer Lodge county.....	13,250,000
Madison county.....	40,000,000
Beaver Head county.....	2,243,500
Jefferson county.....	4,500,000
Emigrant gulch, on the Yellowstone, and the neighboring bars.....	80,000

Approximate total yield of Montana placers.....\$86,384,200

There were over 287 miles of ditches, with 77,848 feet of fluming, carrying 25,370 inches of water, at a cost of \$806,500. Besides these, there were probably 1,000 miles of small ditches for mining and irrigation.

Quartz mining is being carried on every year with better results and on a more extended scale. Through bad management much trouble has been experienced in former years, but matters are righting themselves. The country is by no means prospected for quartz veins, which must exist, and the present yield is no test for the capabilities of the territory. We may expect rich developments hereafter, and not only, it is thought, in quartz, but also in deep alluvials.

The first quartz mill, that of the Philadelphia Enterprise Co., was erected in 1867, at a cost of \$45,000. In 1869, as near as I can learn, there were 34 mills and 476 stamps in the territory. The motive power is steam, for the most part. Many are now in operation, but quite a number are closed.

The number of gold veins, with shafts on them from 20 to 100 feet deep is set down as 400; silver veins explored, 32; copper veins, 19. Smelting furnaces have been erected in a few places and more are to be built at an early day. The yield of gold and silver up to 1869, according to the authority given above, is as follows:

From Quartz.....	\$ 6,000,000
From Placers.....	86,384,200
Total.....	\$92,384,200

COAL.—Coal beds have been found in various localities. A fine vein of bituminous coal, 22 feet in thickness, has been developed near Bozeman. On the banks of the Missouri, just above Benton, a vein is reported, with coal proper for supplying the boats on this stream. On the Gallatin River, coal is exposed by the washing away of the surface dirt. On the road between Helena and Blackfoot, I saw a fine vein, owned by Mr. W. Clancy. Many other beds have been struck, and the quality is often very good. The beds in the region of Fort Union are said to be of a very large extent.

Lead, iron, mercury (cinnabar), tin, fire-clay, gypsum, etc., are all reported in this territory. But the treasures of Montana are yet to be taken out of the earth.

Agriculture.

The main agricultural districts, where farming operations have been carried on, are in Gallatin, Missoula and Choteau counties, each of which is as big as a large-sized State. In Gallatin, the beautiful valleys of the three forks of the Missouri, in Missoula, the valley of Hell Gate and Bitter Root are noted everywhere; and these and others are thickly settled, for a new country, with enterprising farmers. But there is plenty of other good land left yet for new comers.

I have already written you quite fully concerning some of the principal farming districts. I need not, therefore, dwell further on the productiveness and capabilities of the soil. As high as 60 bushels of wheat have been produced to the acre, where care has been taken in seeding down choice lots of ground. In 1868, 23,334 acres yielded an average of 30 bushels of wheat; 18,000 acres of barley yielded 30 bushels; 18,572

acres of oats yielded 35 bushels, and 2,567 acres of potatoes yielded 300 bushels to the acre. Of the latter article, larger amounts are not unusual, and 400 to 500 bushels have often been produced. It has been shown by experience that the only limit to the area of agricultural lands is that prescribed by the water available for irrigation purposes.

In some places, especially Bitter Root and Hell Gate valleys, the oldest agricultural districts of the territory, orchards have been laid out and are beginning to produce largely. Some of the fruit is of excellent quality, but I see that still large quantities of California fruit are sold here, and this brings high prices. But I have no doubt but that Montana will do well in this line, as it gets more thickly settled.

Stock Raising.

As a grazing country, Montana is not surpassed by any place I have seen. The wild bunch-grass grows luxuriantly, from 12 to 18 inches high, and supports in excellent condition huge herds of cattle. Wild hay is cut from thousands of acres. In 1868, there were reported to be 43,216 head of stock in the territory, of an estimated value of over a million and a half dollars. The freedom from snow of the low lands and valleys, in many places, enables cattle to graze and grow fat the year through, and there are but few farmers who feed their stock. In other places, sheep can readily get at abundance of feed under the lighter falls of snow, but farmers would do well to keep hay on hand for winter for their beef cattle; and of good hay they can easily get sufficient for this purpose.

Among my acquaintances, I know a number in the stock business who have invested from \$300 to \$5,000 to commence with, and have had the amounts doubled on their hands within twelve months. The cattle do not require very much care, and the rancher can with advantage carry on farming operations. Sheep raising is an especially good business. I have seen enough personally to convince me of the profit of this, and to know that wool is produced of the finest texture.

But my trip through Montana is at an end, and it is time to conclude my letters. If any one wishes my opinion of the territory he can have it. I can heartily recommend immigration. For the miner, there are still untold quantities of wealth to be taken out of the earth; for the farmer and stock raiser, nature holds out the highest inducements, and the government has plenty of good land for them; for the invalid, there is health and life promised; for the seeker of the beautiful, there are natural wonders. Nearly as large as California, wonderfully rich in natural resources, in an excellent geographical position, Montana is certainly a most inviting field in which to seek a fortune and a home. W. H. M.

Remarks on Metallurgical Experiments

[WRITTEN FOR THE SCIENTIFIC PRESS.]

It is often said, in regard to new metallurgical processes, that though they may succeed on a small scale, that is no proof that they will do so on the large or practical scale.

I submit that this remark, though often apparently sustained by results, loses its force when the experiments are rightly conducted. It has heretofore been observed by a writer in your columns, (Mr. Pique, if I mistake not) that, in chemistry, whatever can be done on a small scale can also be done on a large scale under similar conditions; and he might have added, it can be done in the same length of time. It is precisely for want of attention to the maintenance of essential conditions that experimenters so often fail to carry out their projects in practice.

If the gentleman who, a couple of years ago, undertook to smelt ores of gold and silver, and refine the product at the same time, by the aid of nitre (which was said to have succeeded admirably on the small scale, and which was probably quite correct in theory) had considered the quantity of nitre required to oxidize the lead and copper present, and the difficulty of maintaining, in a furnace, the favorable conditions offered by a clay or sand crucible, he would at once have perceived the impracticability of his scheme.

It is absolutely necessary, in order that small experiments may afford reliable data for practical operations, that regard should be had to the possibility of maintaining all essential conditions in similar proportions. The quantities of all reagents used, in their proportion to that of the ore operated on, must be noted, as a basis for calculations of cost. The material and form of vessels and apparatus must be considered in their chemical, thermal and mechanical

bearing on the result sought. If these points are all attended to, one ton or one hundred tons of ore can be worked in the same way, and in the same time, as one pound or one grain.

First, as to material. The chemical consideration will be, whether the substance composing the vessel in which the operation is conducted, has or has not any effect in promoting or retarding the result; and whether or not the substance operated on will injure or destroy the vessel. The iron of which an amalgamating pan is made, has an important chemical effect on the ore treated in it. Hasty puddling may be boiled in a copper pot, but it would be injudicious to attempt to make nitrate of silver in one.

The thermal considerations, in regard to material, will depend chiefly on conductivity, fusibility and capacity of resisting changes of temperature. Mechanically, strength and hardness must be regarded. Glass is suitable for many small operations, but its extreme fragility constitutes a serious obstacle to its use in the large way. It must also be remembered that the strength of material does not increase in the ratio of its mass.

Secondly, as to form. The surface of vessels of similar form increases as the square of their similar dimensions, but the capacity of such vessels increases as the cubes of those dimensions; hence, if the material of which the vessel is made has a chemical effect which is essential to success, the form should be so modified, as the size is increased, as to expose an extent of surface proportional to the increased capacity; otherwise the smaller vessel will have an advantage over the larger as to the time necessary to complete the operation. For instance, in the case of two amalgamating pans, the greater of which has a diameter double that of the smaller, the extent of surface in the larger one will be four times as great as that of the smaller, but the quantity of pulp contained will be eight times as great; therefore, so far as the chemical effect of the iron surface is concerned, it will take just twice as long to work a charge in the larger pan, as in the smaller. In this particular instance, however, this effect is counteracted more or less by greater pressure and speed of muller. When the chemical effect of the matter operated on is destructive to the material of the vessel, as in the smelting furnace, the less surface is exposed the better.

The effect of form on thermal conditions depends on the same mathematical laws. The larger the vessel, of which the form is unchanged, the less will be the heating surface in proportion to the contents; but the less also will be the radiating or heat-losing surface, so that, though the larger vessel will take longer to heat than the smaller, yet, once heated to a given degree, it will also cool more slowly. Hence the advantage, in point of economy in fuel, lies with the larger vessel, and especially is this the case when, as usually in pans, the heat is applied by means of direct injection of steam to the pulp. In point of fact, the larger operation, as a general, if not invariable rule, has a decided advantage over the smaller in the application of heat.

As vessels or apparatus of similar form increase in size, their strength becomes less in proportion to the load, for the reason that, as already stated, the strength of material does not increase in the ratio of its mass. A point may be reached at which it will break with its own weight, so that a modification of form may be necessary for this reason. Also the hardness of a given substance remains the same in a large mass as in a small one, whence a change of material may be needed, in which case it must be ascertained that this change will not affect the result unfavorably.

The Stetefeldt furnace is an illustration of the fact that a ton of ore can be worked in the same length of time as a smaller quantity. When this furnace was first spoken of, many persons doubted if the ore could possibly be perfectly roasted in the few seconds of time occupied by its descent through the heated shaft. The work done has, I believe, given a practically satisfactory answer to the objection, and the theoretical explanation is equally clear. Every single particle of ore is exposed thoroughly to the action of hot air, salt, etc., during its descent, and, as it is crushed to a very fine powder, the required effect is produced almost instantaneously; and it matters not what may be the number of the falling particles, (of course within the capacity of the furnace) whether ten or ten millions, this effect is produced on each and all at and in the same time.

To use a more familiar illustration. It will not be doubted that if one pound of beans can be boiled in a pot over a fire in one hour, ten pounds of beans can be boiled

in ten pots over as many fires in the same hour. Now if these ten pots and fires be joined so as to constitute one pot and one fire, the heating surface being undiminished, the ten pounds of beans can still be cooked in one hour; and so with any other chemical operation if essential conditions remain unaltered.

If due attention were paid by experimenters to these considerations, fewer disappointments would be experienced in the practical application of their theories, and "practical men" would have less reason to sneer at the suggestions of the so called "scientific cuss."

C. H. A.

The Deepest Shaft.

EDS. PRESS.—In your issue of December 3rd, you say that the deepest excavation in the United States is a copper mine near Lake Superior, being 1,300 feet deep. Permit me to say that the above is a mistake.

The Amador quartz mining company are working a shaft in their mine, located at Sutter Creek, the depth of which is 1,350 feet. At that depth they have a large body of rich ore. This is undoubtedly the deepest excavation in the United States, or North America, and without doubt the deepest gold mine in the world. One owned by an English company located in Brazil, was worked at a depth of 1,800 feet. Owing, however, to insecure timbering, too much water, and the political troubles of the country, the company were compelled to abandon it.

HENRY M. FISKE.

Sutter Creek, Amador county, Dec. 8, 1870.

Silver in the Sea.

The poet tells of the gems that shine with "purest ray serene" in "the dark unfathomed caves of ocean;" but it is not in those inaccessible depths alone that the treasures of the sea lie hidden. There is untold wealth diffused throughout the immensity of its waters, as secure from human avarice as if it were in the abysses which plummet never sounded. Its very diffusion puts it out of our reach. The fact that it is *everywhere* makes it practically *nowhere*. Some years ago, certain French chemists demonstrated that sea-water contains an appreciable amount of silver. They decided that, if it is equally distributed, there must be at least *two millions of tons* of precious metals in the whole ocean, or more than has ever been dug from the earth. And experiments made at widely distant points prove that the metal is thus uniformly diffused. The water of the Pacific off the coast of Chili, as analyzed by an English chemist, gave the same result as the Frenchmen had obtained from the water of the British channel.

We have said that the silver in the sea is useless to us because it is diffused through so vast a bulk of fluid. But the fact that it has been possible to detect it when thus diffused, shows that if chemical agencies can make solid substances vanish from our sight, they can, on the other hand, compel a body thus concealed to show itself, even when it forms only the minute proportion of the mixture. The delicacy of chemical tests is almost beyond belief. A single drop of a colorless liquid added to a gallon of colorless liquid may instantaneously produce well defined red or blue or yellow throughout the entire mass of the latter; and yet it may be less than the hundredth part of a grain of some solid substance in solution that is made to give such unmistakable evidence of its presence.—*Journal of Chemistry.*

HOW BOYS CATCH GOPHERS.—The *Oakland Transcript* of November 30th is responsible for the following:

Noticing a couple of lads each with a live gopher and a string tied around their hind legs, on the outskirts of the city the other day, our curiosity was a little excited to know how the boys caught the animals. Upon inquiry, one of them gave a practical illustration by going to a gopher hole and letting the rodent into it, taking care to hold on to the string. After waiting a moment a violent twitching of the string from the lower end gave indication that some singular proceeding was going on, and he commenced hauling in his line. Soon the captive gopher hove in sight with his teeth fast into the jaws of another animal of the same species. The stranger was immediately seized by the boy, who dexterously avoided being bitten, and the new captive was accommodated with a string on his leg, and made to do duty in assisting the boys to trap other gophers.

Mechanical Progress.

HYDRAULIC MACHINERY ON BOARD STEAMSHIPS.—Mr. A. B. Brown read a paper before the British Association, at the late meeting, in which he urged the applicability of this kind of apparatus to the work of steering, reversing engines, discharging cargo, etc. We quote briefly in reference to the matter of steering: "The steering gear consists of a pair of primary hydraulic cylinders, placed athwart the ship, each with its ram connected to the other at the center, where it carries a bush or swivel collar. Into this collar the tiller is inserted, in which it has free end play. When the port cylinder receives its water supply the starboard cylinder exhausts, and the motion of the tiller is to starboard, and *vice versa*. The valve chest and face, are very similar to that of an ordinary steam engine; but the slide valve is slightly different, inasmuch as its exhaust cavity or port covers all of the ports on the valve chest face, the object of this being to give free communication between the port and starboard cylinder and exhaust. Two bridges are also placed across this exhaust cavity, so that on the necessary movement of the slide valve, the port, starboard, and exhaust passages are all closed. The admission ports are placed at the extremes of the slide valve, which has in its back another face, upon which works a subsidiary valve. The slide valve is moved by an ordinary steering wheel, which has a screwed bush in its nave. This works on a screw on the valve spindle, and thus screws it backwards and forwards; but the smallest possible opening of the slide valve would suffice to put the rudder hard over either way without the steersman being aware of such motion; it is therefore necessary that a self-acting cut off valve should be introduced. This consists of the subsidiary valve, which is moved entirely by the positive motion of the rudder. It resembles an expansion valve of a steam engine, its action being somewhat similar."

SUBSTITUTE FOR ALBUMEN IN PHOTOGRAPHIC PRINTING.—From *Dingler's Journal*: "Lactarine, an article lately introduced, and recommended for printing purposes instead of albumen, is a yellowish white powder of the odor of cheese. Treated with ether, a small amount of soft, saponifiable fat may be extracted at ordinary temperatures. The powder itself is insoluble in water and alcohol; soluble in caustic soda and in a solution of carbonate of soda. Those alkaline solutions being saturated with acetic or hydrochloric acid, curdy flakes separate, which dissolve in an excess of the acid. The solutions form a skin on the surface upon evaporation. Lactarine is soluble in acetic acid, difficult to incinerate; the remaining carbon becomes soft on continued heating, and leaves after complete combustion, colorless, transparent drops in the vessel, which harden after cooling, and consist principally of phosphate of soda. Lactarine therefore is nothing but casein, containing some of the fat and salts of the milk. For use, it is stirred up with a little water, dissolved in ammonia, and mixed with the proper color."

TOOL STEELS AND LOW STEELS.—We clip the following from the special correspondence of the *N. Y. Times*:—"Scarcely a month elapses in which New York capitalists are not solicited for the means to carry out some new steel process, and very frequently not in vain. Almost all of these processes fail, some because they are bad in principle, some for commercial reasons, but most frequently from both causes combined. A majority of them are intended to make tool steel with great economy and in great quantity. Now, the improbability of making a new tool steel equal to that of Sheffield, or of Pittsburg, is extreme, and its practicality can be demonstrated only after protracted experience in its working; and it is very seldom that new processes make a steel of any commercial value whatever. But a point of equal importance, and one overlooked very generally, is that the trade does not stand in need of any increased facilities for making good tool steels. The market is full of them, and they can be bought as cheaply as we have any right to expect at present. The quantity required for consumption is very limited, and would not be materially increased were the price one-half what it now is. The real want is cheap and reliable processes for making low steels, in quantities practically unlimited. Indeed, this is the greatest present problem of American metallurgy, and must, in the immediate future, employ the highest skill and scientific knowledge, and the most liberal expenditures of capital."

PROP. SEELY'S WOOD-PRESERVING PROCESS.—Dr. Adolph Ott writes the *N. Y. Engineering*, explaining the difference between this process and that of the Englishman Bethell, in 1838. Both consist in impregnating the wood with creosote. "By the Bethell process, wood and liquid are contained in a closed and strong iron receptacle; more liquid is forced into it, until a pressure of 200 pounds to the square inch is reached. This requires a very heavy and expensive apparatus and a great amount of power; and it is not available for unseasoned lumber, on account of the fact that if the interstices of the wood are filled with sap, no amount of power will effect the entrance of the preservative liquid. The Seely process, however, consists in subjecting the wood to a temperature above the boiling point of water, and below 250° Fahrenheit, while immersed in a bath of creosote oil for a sufficient length of time to expel the moisture. The water being thus expelled, the hot oil is quickly displaced by a bath of cold oil, by means of which the steam in the pores is condensed, and a vacuum formed, into which the oil is forced by atmospheric pressure and capillary action. Green wood may be treated as perfectly as dry. No pressure being exerted, the cylinders may be constructed of the lightest iron capable of resisting the weight only. Moreover, the heat being communicated indirectly by a steam coil, and no vapor being generated, the perfect safety of the operation is insured."

AMERICAN HARDWARE.—Says the *London Ironmonger*: "We are running a great risk in England of being beaten by America in the manufacture of axes, shovels, hoes, and other manufactures of the kind. The Pittsburg steel, both cast and rolled, is fully up to the best English—in fact, to such a degree that it is not only supplanting our produce, but in every shape of tool it is being exported to the European Continent. American bolts and hinges excel ours, and medium and American cutlery of all kinds is cheaper and better than any manufactured here." Says the *London Times* of edge to us: "The manufacturers of the United States can import iron and steel from this country at a heavy duty, work up the metal by highly paid labor, and heat us out of the market after all with the manufactured article." * * "The Americans succeed in supplanting us by novelty of construction and excellence of make."

COAL PROSPECTING WITH DIAMOND DRILL.—The Philadelphia correspondent of the *Iron Age* describes the work at the coal field of the Phoenix Park Co., near Pottsville. "At 700 feet deep, the hole was as straight as an arrow, and two inches in diameter. At that depth a core bit was used, and but ten feet per day could be made, the delay being occasioned in raising the rods and removing the core. An arrangement in the bit holds the core, and brings it all out, and it showed plainly every seam and stratum bored through during the day. The greatest distance driven in a day was 43 feet. Six hundred feet from the top, the solid bit bored 20 feet in a day—the core bit 10 feet. The total depth bored was 750 feet 10 inches, making the deepest boring in the region, and cutting 53 feet of workable coal. Even this, however, did not reach the bottom of the basin."

NEW HORSE SHOE MACHINE.—The Providence Horse-shoe Co. has in operation a new machine, the working of which the *Iron Age* of Dec. 1st thus describes:—"The iron is rolled to required dimensions for the several sizes in bars about 12 feet long, with indentures for the nails, each bar divided into 10 shoe shapes. These bars are heated in a long furnace to a white heat and passed directly to the machine, which works two bars at a time, requiring two men to feed the bars to the machine with iron tongs. The process of cutting off, thickening the heels, forming the shape around the dies, and making the concave on the back of the shoe, is rapidly performed by one operation of the machine. The machine weighs 5 tons, requiring 4 horsepower to run it, and has a capacity for making one ton of horse shoes per hour."

LARGEST TURBINE YET.—A turbine water-wheel ten and a half feet in diameter, and weighing 20,000 pounds, has just been cast at the works in Springfield, Mass.

Scientific Progress.

MOLECULE, SKY MATTER, MASS.—In Prof. Tyndall's late address before the British Association, he explains the blueness of the sky on the supposition that the ether waves reflected bear, as regards size, a certain proportion to the size of the reflecting particles; and that the "sky matter" particles are too minute to reflect any waves larger than the blue ones. These minute particles are, as to size, the middle term in the series of transformations of matter in the molecule to matter in the mass. In illustration, Prof. Tyndall instanced the following experiment: "Sulphur and oxygen combine to form sulphurous acid gas. Two atoms of oxygen and one of sulphur constitute the molecule of sulphurous acid. Now it has been recently shown in a number of instances that waves of ether issuing from a strong source, such as the sun or the electric light, are competent to shake asunder the atoms of gaseous molecules. Including the substance in a suitable vessel, placing it in a dark room, and sending through it a powerful beam of light, we at first see nothing; the vessel containing the gas is as empty as a vacuum. Soon, however, along the track of the beam a beautiful sky-blue color is observed, which is due to the liberated particles of sulphur. For a time the blue grows more intense; it then becomes whitish; and from a whitish blue it passes to a more or less perfect white. If the action be continued long enough, we end by filling the tube with a dense cloud of sulphur particles, which by the application of proper means may be rendered visible. Here, then, our ether waves untie the bond of chemical affinity, and liberate a body—sulphur—which at ordinary temperatures is a solid, and which therefore soon becomes an object of the senses. We have first of all the free atoms of sulphur, which are both invisible and incompetent to stir the retina sensibly with scattered light. But these atoms gradually enalesce and form particles, which grow larger by continual accretion until after a minute or two they appear as sky matter. In this condition they are invisible themselves, but competent to send an amount of wave motion to the retina sufficient to produce the firmamental blue. The particles continue, or may be caused to continue, in this condition for a considerable time, during which no microscope can cope with them. But they continually grow larger, and pass by insensible gradations into the state of cloud, when they can no longer elude the armed eye. Thus without solution of continuity we start with matter in the molecule, and end with matter in the mass, sky matter being the middle term of the series of transformations."

THE ELECTRIC LIGHT IN PARIS.—The Paris correspondent of the *London Engineer*, Nov. 11th, says:—"The apparatus set up on Montmartre is arranged by M. Bazin, and is electro-magnetic. The central cylinder supports four series of double coils covered with copper wire enveloped in silk; the cylinder is rotated by a small steam-engine of 3-horse power, making 400 revolutions per minute. The lamp used is of the ordinary form, with the Foucault-Duboscq regulator. The reflector is parabolic in form, and the whole is surrounded by a shield to hide it from the enemy. This light, from its elevated position, commands the whole of Paris and the plains around. A spectator on Montmartre sees distinctly the details of the facade of a building which stands 2,600 metres off; at 2,900 metres a man may be seen standing at a window; at 3,000 metres a mass of cavalry or infantry is distinguishable; and at 4,000 metres the dome of the Invalides, with its bands of gold, is brilliant. A man cannot be seen on the dome at that distance, but on walking towards the building all soon becomes clear. On the ramparts, at 3,800 metres from Montmartre, the light is sufficient to read an ordinary newspaper."

THE ECLIPSE.—*Nature* announces that the English Government has determined to aid the expeditions in the most ample manner. This decision was announced to the Royal Astronomical Society on Nov. 11th. "There will be a ship furnished by the Government to carry observers to Spain. There will be funds to convey observers overland to Naples, and a ship to carry them on to Messina. The various European governments have been requested to aid the various parties, and, generally, the influence of the Government is being brought to bear in every way."

HELMHOLTZ ON FARADAY.—In the preface to the German edition of "Faraday as a Discoverer," recently superintended by Professor Helmholtz, he speaks of the wonderful series of discoveries made by that gifted philosopher as "surprises, the product, apparently, of an inconceivable instinct;"—and says that Faraday himself, even afterwards, could hardly explain the intellectual steps which led to these discoveries. His genius perceived truths "which bewildered the investigators of his time, and the clearer meaning of which has since been in part made out by mathematical theory." * * "More especially he opposed the action of forces at a distance, the assumption of two electric fluids and of two magnetic fluids, and, in like manner, all hypotheses which contradicted the law of the conservation of force, of which he had an early presage, though he singularly misapprehended its mathematical expression. And in these precise directions he exercised, in the first place, the most unmistakable influence on the physicists of England. The mathematicians among them, especially, labor to render theories of phenomena the pure and true expression of the laws of fact, to the exclusion of all arbitrary theoretic devices. In this way Faraday's ideas, though in a modified form, often reveal themselves with their true significance assigned to them."

HYPOTHESIS REGARDING THE CORONA.—J. A. Oudemans writes *Nature* as follows:—"I think that a part of the luminous phenomenon which we call the Corona belongs to an atmosphere of the sun having a feeble reflecting power, or being itself luminous. But the beams in the Corona, whose variability is now confirmed anew, are necessarily an optical phenomenon. They originate, I believe, in the inequalities of the moon's surface. If the sunlight slants somewhere along the moon's limb through a valley, we observe from our point of view a beam, provided there exist between the moon and us particles able to reflect the sunlight, or to transmit it like semi-transparent bodies. There is no need to have recourse to diffraction. To look for these particles in the atmosphere of the earth, as Mr. Gould does, is, in my opinion, not tenable, as the Corona and the beams have also been observed in eclipses, where the cone of the shadow even had a breadth of thirty-six German leagues. The molecules of the atmosphere, which we see around the eclipsed sun, are wholly within the cone of the shadow. These reflecting particles are undoubtedly to be looked for beyond our atmosphere, between the moon and the earth, and I believe that they may be regarded as identical with those particles which float in the ether, and under other circumstances cause the zodiacal light."

A NEW AND REMARKABLE COAL.—Prof. Wurtz in the *Gas Light Journal* of Dec. 3d gives a letter from New Bethlehem Pa., announcing the discovery there of a new canal coal, samples of which have been sent him, and of which he thus speaks: "At first glance it has the characteristic aspect of some of the English Canals, having the cuboidal jointage and dull black conchoidal fracture, but on looking closer, strange peculiarities appear. The fractured surface is full of minute glistening points as if it had a finely crystalline (almost crypto-crystalline) texture. The strangest thing, however, is that when cut, or even rubbed, with a knife blade, it assumes a brilliant lustre, precisely like graphite or plumbago. It easily streaks paper, the streak having a slightly olive-brown tinge, and being (as observed by the writer in the case of *graphamite*) indelible by india rubber. It might be used for making a sort of crayon. This would seem to indicate an admixture of something similar to the *viscine* of the writer. In the fire it burns much like a good ordinary canal, cracking to pieces with some decrepitation, without any caking, yielding a voluminous and cheerful flame, and leaving considerable white ash. A full account of all its properties, chemical and otherwise, will soon be given to our readers."

AGRICULTURAL DEPARTMENT.

Agricultural and Horticultural Work for December.

Farmers and gardeners pretty generally have a busy time during this month. In November we expect rain in sufficient quantities to permit plowing the fields, and preparing generally for planting.

Although we cannot lay down definite rules for work to be done during this month in California, as they do in the Eastern States and in Europe, on account of the peculiarities of our climate, yet the beginning of the rainy season presses certain work upon the farmer and gardener in every part of the State, which cannot very well be done at any other time. When Horace Bushnell speaks of the incredible anomalies of the California climates, we must admit his correctness, as work which is very properly performed during May in the northern parts of the State, may be effected in January or February in other parts of it.

Fruit and ornamental trees, evergreens and flowering shrubs should be planted as soon as the ground can be prepared for them, as nothing is so beneficial to newly set-out trees, shrubs and vines as a few good showers of rain. Early planting should be an established rule in California.

Lawns and flower-beds should receive a good top-dressing of manure now. Some object to this on account of the odor and appearance, but we advise our friends not to be too particular on this point, if they wish to keep their lawns, grassplots and flower-beds in a condition to produce a new and vigorous growth.

This is a very good time to prune all kinds of trees and shrubs; to clip hedges and horders, and to provide plants with proper stakes, so as to keep them in good shape. In cold countries this work is delayed until spring, as severe frosts seriously injure the newly-cut wood.

Any tree, shrub or flower seed which is sown during this month should be raised under glass, and have the full benefit of a sunny aspect; many varieties even require bottom heat to cause them to germinate freely.

Greenhouses and conservatories should receive plenty of fresh air during the morning and early afternoon, to harden the plants to some extent; we do not like to see plants in the greenhouse or conservatory throwing up spindling shoots as if they were climbers, which they will frequently do, and which is attributable to close confinement, insufficient room, or being placed at too great a distance from the glass roof. Plants under glass require less water during the winter months on account of the moist and cold atmosphere, but when artificial heat is maintained for tropical plants or for forcing purposes, the amount of water to be given must depend chiefly on the nature of the plants themselves. A high temperature generally requires an abundance of moisture.

The old wood of blackberries and raspberries should be pruned out now, if not already done; if this is left until the spring, a great many fruit-bearing buds, and young suckers not now visible, will be broken off and destroyed.

Strawberry vines should be planted out this month, if a fair crop is expected of them during the coming season.

We would also advise the owners of vineyards to prune their vines now, or as soon as time and circumstances will permit.

Hyacinths may be placed in glasses or pots now, so as to have them in bloom during January and February. We would advise the lovers of this beautiful bulbous root, to place them, after planting, in a dark room for a fortnight, when they will make strong roots before developing their leaves; this will enable them to send forth a much more vigorous flower-stock than will be obtained under the ordinary treatment.

We had almost forgotten to mention the Dahlia, which should now be taken up and stored away in some cool, dark place, where the temperature is even and comparatively dry, and where the tubers can rest and recuperate preparatory to being planted out again.—*California Horticulturist*.

Training Grape Vines.

I am inclined to think that Californians have fallen into an error in the training and culture of grape vines. It is true this is a new country and a great many new ways have been adopted; some are well and improvements on the old systems; others remain to be more thoroughly tested. The almost universal practice of cutting the

vines of the grape almost back to the ground is a matter I have been considering for some time. I wish to mention one or two facts observed during the past season. A farmer in this neighborhood had a few vines of the same variety near each other. Half the number were cut back after the California fashion, leaving only two or three buds to each stem. The other half were trained on a frame for eight or ten feet and then cut back. This year, whilst those of the short stems only yielded a few bunches to each root, those on the frames bore more than 20 times as many.

Another gentleman, a grape culturist, brought to town some vines, the growth of two years, which he had allowed to run on the ground. They were perhaps 20 feet in length and must have yielded at least 50 pounds to each stem. As to the quality of these grapes on long stems, they were quite as good as those on the short stems.

Now these facts may be exceptions to a general rule in the training of the grape vine, but I can see no reason why more wood should not be allowed to grow, whether the vine be on a frame or on the ground, especially where the soil is rich and moist. On dry, barren hill-sides cutting close may be proper, but even there, when the roots are large and spreading, more wood should be matured, and consequently a larger yield of fruit would result. In frame culture the saving of land surface would be an important item. The saving of labor in cultivating so much surface would hardly be counterbalanced by the expense and labor of constructing frames. If it is thought best to have the grapes grow near the earth so as to receive more heat, the frames might be simply stakes one or two feet high, to hold the vines out of the way of the plow or cultivator.

Should my suggestions be erroneous, will not some practical grape grower set me right and at the same time enlighten our people a little on this subject?

C. L. ANDERSON.

Santa Cruz, Cal., Dec. 9th, 1870.

Work and Think.

Hammer, tongs and anvil ringing,
Waking echoes all day long,
In a deep-toned voice are singing
Thrifty Labor's iron song.
From a thousand fly-wheels bounding,
From a thousand humming looms,
Night and day the notes are sounding
Through the misty factory rooms.
Listen, workmen, to their play—
There's advice in every cluck;
Still they're singing—still they're saying—
"Whist you labor, learn to THINK!"

Think what power lies within you,
For what triumphs ye are formed,
If in aid of bone and sinew,
Hearts by emulation warmed.
Mighty though ye woo and cherish,
What shall hold your spirits down?
What shall make your high hopes perish?
Why shall ye mind Fortune's frown?
Do you wish for profit, pleasure?
Thirst at Learning's fount to drink?
Crave ye honor, fame or treasure?
Ye the germs have—work and think.

Think! but not alone of living,
Like the horse, from day to day;
Think! but not alone of giving
Health for pelf, or soul for pay!
Think! O, be machines no longer—
Like the windmills by the way;
Think! 'twill make you fresher, stronger,
Link you to the great and good!
Thought exalts and lightens labor,
Thought forbids the soul to sink!
Self-respect and love for neighbor
Mark the men who work and think!

Think! and let the thought now nerve you—
Think of men who've gone before—
Leaving lustrous names to serve you;
Yours the path they've plodded o'er!
Freedom fights and wins her charter,
With the sword of thought—the pen!
Tyranny can find no quarter
In the ranks of thinking men.
Think! for thought's a wand of power—
Power to make oppression shrink;
Grasp ye, then, the precious dower!
Poise it—wield it—work and think!

Hold your hands up, toiling brothers;
'Mongst us be it ne'er forgot,
Labor for ourselves and others
Is for man a noble lot.
Nobler far, and holier, higher,
Than vain luxury can claim,
If but zeal and worth inspire,
And true greatness be our aim.
Power to compass this is given—
Power that forms the strongest link
'Twixt an upright man and heaven,
His noblest power—the power to THINK!

SHOO FLY.—Grass Valley has another invention, the "Shoo Fly," a machine intended to keep away flies from one's bodily vicinity.

California Agricultural Notes.

THE FARMING LAND in all the most available locations along the line of the California and Oregon Railroad is being rapidly taken up by settlers, and many holders of Spanish grants are dividing up their large possessions into small tracts. Desirable settlers for such lands are dealt with generously.

SHEEP SKINS.—A single tannery near Saratoga is turning out about 7,000 sheepskins a week for book-binding purposes.

A MONSTER STEER has been raised in Chico by J. C. Maudeville, and sold in Marysville for \$500, where it will be served up for Christmas dinners. It could not be got into any of the ordinary cattle cars, but had to make the trip on a platform car.

BIG PUMPKIN.—P. C. Robertson, says the *Yolo Democrat*, recently received by express from T. Y. Tibbs, of Poor Man's Flat, Sonoma County, a pumpkin weighing 196½ pounds, measuring 6 feet 2 inches one way around and 5 feet 2 inches the other.

LARGE YIELD.—Some idea may be formed of the large yield of young fruit trees in this state from the fact that George Squires, of Dutch Flat, Placer County, recently gathered 450 pounds of apples from an apple tree less than six inches in diameter.

TWO SIDES.—The milkmen of this city have resolved to get up a black book, in which shall be entered the names of delinquent customers; the "customers," both paying and non-paying, propose "another hook" in which shall be entered the names of all milkmen who eke out the lacteal fluids by draught from the pump.

Eastern Agricultural Notes.

EXPENSIVE HOG PEN.—A crazy Connecticut farmer has just finished a hog pen at a cost of \$2,000. It is grained on the outside, and papered inside.

THE GRAIN SHIPMENTS by the Erie Canal are said to have increased the past year by full a million bushels, notwithstanding the general decreased yield of the crop throughout the west.

EXPENSIVE.—The estimated annual expense of running the Departments of Agriculture, Emigration and Colonization in the New Canadian Government, is set down at \$279,655. Some of the people in the "New Dominion" are beginning to open their eyes at these and similar figures.

MALAGA GRAPES are said to be cheaper and better this season than ever before, in Europe.

THE LATEST HORSE TRICK.—It is said that horse dealers in St. Louis sometimes put sulphuric acid on the hoofs of horses to make them "show off" or appear antic.

GOOD COWS are selling in Maine for \$20 each.

BIG RADISH.—The local of the Keokuk (Iowa) *Gale City* boasts of a radish weighing eighteen pounds.

EXHIBITION OF SWINE.—Is is proposed to hold a Fair in Chicago next September, for the exhibition of swine exclusively, with premiums aggregating from \$5,000 to \$10,000!

THE EXPERIMENTAL FARM, of Eastern Pennsylvania, has raised, the present season, 150 varieties of potatoes, between 30 and 40 varieties of wheat, and 30 varieties of oats.

NEW AND FATAL CATTLE DISEASE.—A new and singular disease has broken out among the cattle of Somerset county, New Jersey. The animals attacked died in about three hours.

GROWTH OF THE WOOL INTEREST.—The production of wool from California commenced in 1855, with 360,000 pounds. The export for the present year is estimated at 20,000,000 pounds, or fully 25 per cent. over the yield of any previous year. An increase from 180 to 10,000 tons in 15 years shows a very healthy growth.

PORK PACKING.—The business of pork packing is beginning to be one of considerable importance in this state. One of the largest establishments of the kind in the mountains is that of Cashin & Restof, near Grass Valley, of which the Nevada *Transcript* says:—"The product of this establishment is of the best quality, the meat being cured with the greatest care, and the lard made entirely of pork and by the best process. The whole establishment is neat and clean, and every part of the process is conducted with the greatest care."

A PROFITABLE CROP.—A farmer in Ohio, recently picked 400 bushels of cranberries, from three acres, and sold the lot for \$1,520.

Interesting Facts for Farmers About Ramdell's Norway Oats.

Few among the masses of the people, realize the immense wealth the world holds in the yearly products of a single kind of grain; or the immense addition to that wealth which is often made by the introduction of an improved method of cultivation, or by the origination of a new variety of an improved character in yield or quality. But with the intelligent agriculturist or political economist such facts are of the highest importance to the welfare of the world.

The yearly product of the oat crop of the country is estimated at 300,000,000 of bushels, growing upon 10,000,000 acres of land, or about 30 bushels to the acre. This crop at say 33½ cents a bushel reaches a value of \$100,000,000. Now suppose some enterprising individual can introduce a variety which will increase the yield from 30 to 60 bushels to the acre. Does he not directly add to the wealth of the country \$100,000,000 annually?

Now by reading what follows it will be seen that this is a low estimate of what has been done by Mr. Ramsdell in introducing his new variety of oats to the country.

THEIR INTRODUCTION INTO EUROPE.

The fame of this new oat has gone out into almost every civilized country on the Globe. Experiments, to a greater or less extent have been made in several countries of Europe—which would have been greatly extended the coming season, if it had not been for the awful ravages of war and preparations therefor, which are working such terrible inroads into the peaceful occupations of that portion of the world.

Both capitalists and the governments themselves have in some instances manifested their readiness to assist and encourage, in a substantial way, their introduction into their respective countries. And well they may, for it would effect an annual money increase to the value of that product, on the continent, of not less than two hundred million dollars! as the present aggregate yield of that grain there is 600,000,000 bushels. The story of

THE WONDERFULLY PRODUCTIVE POWER

Of this grain was at first received by many with much doubt; but the evidence has now become so cumulative that it is useless to longer contend against their being an improvement of vast consequence. To this conclusion we must come if we are to exercise the common rules of evidence with regard to the volumes of competent testimony which are constantly flowing in to the fortunate originator of this valuable cereal. Not less than

25,000 PRACTICAL FARMERS

In various parts of the United States have united their testimony in this direction. This testimony is in the main received and approved by the

LEADING AGRICULTURAL PAPERS

Of the country which have collected the information in their own localities and from their immediate friends and collated the same for their own satisfaction and for that of their readers. Great numbers of

INFLUENTIAL SCIENTIFIC WRITERS

Upon agriculture have joined their testimony to the common mass of evidence. We will here endeavor to give a brief allusion to some of this mass of testimony.

The *American Agriculturist* says: Last fall, we asked for the experience of those of the readers of the *American Agriculturist* who had raised the Norway oat, or had tried it in comparison with other sorts. We have received a number of responses, and proposed to print them this month, but they are crowded out. The writers who have had good seed, with a few exceptions, seem greatly in favor of the Norway. The yield in some instances has been enormous. The straw is uniformly extolled for stiffness, length and leafiness. In procuring seed for planting, we surely would try some Norway, even if they failed last year.

The *Chicago Republican* says: "We believe we can do no greater favor or service to the thousands who read the *Republican*, farmers and those interested in the introduction of improved cereals, than to point out to them the merits of these oats. * * A given quantity will weigh a large per cent. more than other variety; the berry is larger, the hull thinner and the grain more nutritious, and hence better for feeding."

The Massachusetts *Plowman* says: "The straw is remarkable for size and beauty, and the kernel plump. This new variety of oat introduced to culture but two or three years ago, has met with great favor, and, so far as we have heard, has given great satisfaction."

We might fill pages with similar extracts from the Atlantic papers; but we pass to the.

EXPRESSIONS OF THE PACIFIC PRESS.

The *Alta* of this city says: "Those farmers who wish to sow oats may do well by trying the Norway variety, which is recommended for being more hardy and producing more grain to the acre than other kinds. Mr. E. Tripp assures us that one acre sown in March last by Mr. Miller, near San Leandro, produced 125 bushels, and a field of sixteen acres near Santa Rosa, sown in April, averaged 92 bushels."

The *New Northwest*, published in Montana says: "Mr. W. B. Harland sowed, this year in the Upper Bitter Root Valley, seven bushels of seed [Norway Oats] on seven acres of ground, and has just cleaned up over five hundred bushels as the yield. This is over 71 bushels per acre, while 30 bushels of common oats is a good yield. At 32 pounds to the bushel, and five cents per pound—the fair estimate of price for oats in this Valley—a crop of this kind is a pretty good thing to have; while the straw, which grows from five to eight feet high, would board and lodge half the cattle in the Bitter Root all season. We hope our Warm Spring farmers will supply themselves with seed of this variety while they have opportunity. [See directions at close of this article for procuring the "seed"]."

The *Denver News* of Oct. 10th, 1870, after speaking at some length of their introduction and successful cultivation in that territory, says: "These oats are far more profitable to raise than any variety with which we are acquainted. The testimony of our farmers is that they yield from thirty to fifty per cent. more than any other variety, and cost no more to cultivate. To obtain seed, therefore, for the next year is the duty of all who have not yet done so. * * * We cannot too strongly advise our agriculturists to do so."

Mr. Samuel Sellers, of Antioch, Contra Costa Co. Cal., writes that he sowed 2½ bushels of these oats about the first of February last, and harvested about 400 bushels from that sowing.

EXTRAORDINARY YIELD AT STOCKTON

Mr. Samuel Miller, of Stockton, San Joaquin Co. Cal. says that from one bushel (32 pounds) of Norway oats sowed about the first of March last, on one acre of ground he harvested 125 bushels and some odd pounds!

Mr. E. Tripp, of this city sowed, on the 13th of April last, a portion of a field in Sonoma county, which, without a drop of rain, yielded at the rate of 92 bushels to the acre; while portions of the same field which were sowed with common oats did not mature at all, on account of the drought!

Such are some of the evidences of the extraordinary yield of these oats on the Pacific Slope! We would here call particular attention to the lateness of the season at which the last mentioned lots were sold, and their remarkable yield under adverse circumstances.

EXCELLENCE OF THE GRAIN AND STRAW.

The testimony in favor of the superiority of the kernel of this oat is as overwhelming as that in favor of its large yield. It forms a hard, well formed, heavy grain, the importance of which every farmer and miller fully understands. Much is also said of the superior value of the straw. We are told of a gentleman in Oakland, who, as a test placed a quantity of superior hay before his horses, by the side of some Norway oats straw. The horses chose the straw in preference to the hay and filled themselves from it. These oats are also very valuable for green soiling, for which their preface and superior foliage seems to peculiarly adapt them.

Another important advantage possessed by them is due to the fact that they will admit of being eat greener than is practical with any other grain.

WHEN TO SOW.

Mr. Ransdell in a circular addressed with regard to the best time to sow the Norway oats says: "It is much better to wait till the ground gets quite warm and dry before sowing, as they stand much better than if sowed earlier."

This would seem to agree with the experience of last season in this State, as recorded above, under the "extraordinary yield at Stockton." Still it would no doubt be quite as well to sow early in this warm climate, on account of the late rains, and not wait later than the 1st of March.

We would refer the reader to advertisement on last page.

The above cut represents a single head of the Ransdell Norway Oats, reduced and copied by photo graphy, from which

this engraving is made. The natural length of this head is thirty-one inches, and it is believed to be the largest ever grown

S. F. Domestic Produce Market.

SAN FRANCISCO, Thursday, P. M., Dec. 15th.

FLOUR—Is still in small demand for export; although the demand for local trade continues fair. We note no changes in prices from last week. Standard Oregon brands are quotable at \$6.37@6.50; local brands—superfine, \$5.25@5.50; extra \$6.37@6.50. We note sales of 2,000 barrels California extra; 5,000 Oregon extra and 3,000 California superfine, at current rates—the latter for export.

WHEAT—Has been in better demand, during the past week, and at a slight advance, especially for choice shipping goods. Sales are reported to the amount of 50,000 sacks, at current prices for shipping and milling. We quote the range of all kinds at \$1.85@2.15; good to choice shipping, \$2.12@2.15; choice milling, \$2.12@2.15. Some small fancy lots for local milling have been sold during the week for \$2.20. Liverpool quotations came through to-day at 11s 4d@11s 5d. New York rates remain unchanged—\$1.62@1.65 per bushel.

BAILEY—Is still in fair demand, and prices have remained unchanged during the week. We quote \$1.25@1.35, from fair to choice. Sales of some 10,000 sacks are reported.

OATS—The market still continues inactive. Fair to good may be quoted at \$1.35@1.60, at which prices some 5,000 sacks have changed hands.

CORN—May be quoted at \$1.37½ @ 100 lbs for good yellow, at which figure the latest sale was made.

BUCKWHEAT—Nominal at \$2.50@3 from the wharf. No sales.

RYE—In limited demand. The latest sale is reported at \$2.12½.

FEED—Remains with but little change. We quote Hay a little easier at \$10@15 from fair to choice; Straw, \$7@9; Bran, \$28@30; Minnings, \$33.50@35 per ton; OIL CAKE MEAL, \$28.00.

HONEY—In good demand at the following rates: Los Angeles, 5-gall cans, \$12@16, and Potter's, 2 lb do, at \$4 @ 1 dozen.

POTATOES—Market firmer for all descriptions. The receipts have been quite heavy during the week—12,000 sacks were received from Humboldt on Tuesday, which found a good market. We quote common \$1.40@1.75; Sweet, \$1.37@1.50.

HOPS—The crop of 1869 dull of sale at 5@5c. This year's crop is still quotable at 10@12½c.

HIDES—We quote Dry, slaughter's stock, 16½@18c; Salted; 7½@8½c. Sales during the week 1644 Cal. dry.

WOOL—Has been in slight demand. Sales light. We quote good shipping, at 15@17c; very choice, 18c; burry, 10@12½; slightly do, 13@14c.

TALLOW—Quotable at 7½@8½c; the latter an extreme figure.

SEEDS—California Mustard, none in the market; Flax 3@3½c.; Canary, 7@8c.

BEANS—Quiet at the following rates. Bayo at \$2.50@2.75; butter, \$2.50 for small, \$3 for large; small white and pink \$2.00; pea and red \$2.25 per 100 pounds.

FRESH MEAT—Beef in good supply without any special change in prices. Several car loads have come to hand from Nevada during the week. We quote prices from slaughterers to dealers:

BEEF—American, 1st quality, 9@10c @ lb.
Do 2d do 7@8c @ lb.
Do 3d do 5@6c @ lb.

VEAL—From 8@11c.

MUTTON—Steady at 6@7c. @ lb.

LAMB—9@10c. @ lb.

PORK—Undressed at 5½@6½c; dressed, 8½@9½c. @ lb.

POULTRY, ETC.—The market is well stocked, and prices unchanged. Spring Chickens, \$5@6; Hens \$7@8.50; Roosters, \$7@8.50; Ducks, tame, \$6@7 @ doz; do wild, \$2@3.00 @ doz; geese, tame, \$2@2.50 @ pair; wild \$1.75@3 @ doz; tame Turkeys, 17@19c @ lb; Hare, \$2.50 @ 3 @ doz; Doves, 50c do; Quail, \$1.25@1.50; Snipe, 75c do; do English, \$1.50 do. Venison, 8@9c @ lb.

DAIRY PRODUCTS—Rule lower; California Butter, Fresh, in rolls, 40@50c; ordinary, 32@40c; Irkin, 35@42c @ lb. Cheese is in fair supply—California, new, 12@15c., Eastern, 17c. Eggs, California fresh 42@50c; Oregon, 37½@40c. California Lard, 11½@12½c; 11@13½c; Oregon, 12½@13½c, according to package.

FRUIT—We submit the following prices, for which we are indebted to A. Lusk & Co.: Apples, per box, eating \$1.25@2; cooking, \$1@1.50. Grapes, per pound, native, 4@5; foreign, 10@20c. Pears, per box, eating, \$2@3; cooking, \$1.25@1.50. Strawberries, per pound, 15@20c. Oranges, per M, \$35@50. Lemons, per box \$42; per 100, \$4. Cocoanuts, per case, \$7@8. Pine Apples, per doz., \$9.

CASE GOODS—In 2 lb cans, per doz., Apricots, \$4; Apples, \$2.50; Blackberries, \$1; German Prunes, \$4; Grapes, \$4; Peach, table, \$4; Peach, pie, \$3; Pie, assorted, \$3; Plum, table, \$3.50; Plum, pie, \$3; Pears, \$3.75; Quince, \$3.50; Tomatoes, \$2; Table, assorted, \$3.75.

GENERAL MERCHANDISE.

AGRICULTURAL IMPLEMENTS—Have been in good demand since the late rains, and a good demand is expected to continue for the season.

BAGS AND BAGGING—Are in moderate request only, and will not be until the approach of the coming season. We quote wool bags at 50@52½c. Oat Sacks 23x40, 12½c; 28x35, 18c; Potato Gunnies, 24½@25c.; imitation Donkeys, 19@20c.

BUILDING AND FENCING MATERIALS—Are in better demand, and prices are reported firm. Immediately after the first heavy rains the market was nearly emptied of fencing stuff. We quote wholesale rates to dealers: Redwood Rough at \$18; do Siding, \$22.50; do Surfaced, \$30; Fancy Pickets, \$30; Oregon Rough, \$17; do Flooring, \$27; do Fencing, \$18; Laths, \$3@3.25, and Redwood Shingles, \$2.75 @ M.

DRIED FRUITS—Are in only moderate request at the present time. Sales of 25 bbls. Zante Currants, private; 50 kegs Oregon Dried Apples, and 5 cs Citron on private terms. We quote the market as follows: Cal. Dried Apples, 5½c; Oregon do, 6½c; Languedoc Almonds, 25c; Figs, Smyrna, 15@20c; Prunes, Hungarian, 14@16c, for old and new respectively, @ lb; Raisins, layer, \$4.50@5; Currants, Zante, 14½@15½c, for old and new; Citron, 40@42½c.

PROVISIONS—The stocks of all kinds of Cured Meats are in fair supply, and a good demand continues to exist. We quote jobbing rates as follows: Hams, California, at 13@13½c; Oregon do, 16½@17c; Bacon, California, 15@15½c; Oregon do, 16½@17c; Lard, California, 12½@13½c; Oregon do, in kegs, 12½@13½c @ lb.

PEPPER-TREE BERRIES FOR FOWLS.—Mr. Alexander Campbell, of Oakland, informs us that he uses the fruit of the South American pepper-tree (*schinus molle*) to mix occasionally with the food for his chickens, instead of the ordinary pepper of commerce, and he finds it quite as good or better for them.

The fruit of this tree, which is often called here the California pepper-tree, is a red berry, enclosing a large seed, which, when dry, is powdered and often used upon the table as a substitute for black pepper. Though nearly resembling pepper in taste and appearance, the plant producing that spice is not at all related to this, either botanically or in appearance; as the real pepper plant has more the appearance and form of the comma calla, or Egyptian lily.

The so-called California pepper-tree, however, is really one of our prettiest ornamental evergreens, growing either as a shrub or a tree, at the will of the gardener.

It is very hardy and easily grown with us, and stands our dry season, without water, better than almost any other tree, being a native of a dry country—Peru. As an ornament, as a break-wind, as a shelter or a shade, it is peculiarly adapted to our State, and deserves to become a much more common tree about our homesteads.

THE SECRETS OF THE OCEAN.—Mr. Green, the famous diver, gives the following sketch of what he saw at the "Silver Banks," near Hayti: The banks of coral on which my dives were made, are about 40 miles in length, and from 10 to 20 miles in breadth. On this bank of coral is presented to the diver one of the most beautiful and sublime scenes the eye ever beheld. The water varies from 10 to 100 feet in depth, and is so clear that the diver can see from 200 to 300 feet when submerged, with but little obstruction to the sight. The bottom of the ocean, in many places, is as smooth as a marble floor; in others it is studded with coral columns, from 10 to 100 feet in height, and from one to 80 feet in diameter. The tops of the more lofty support a myriad of pyramidal pendants, giving reality to the imaginary abode of some water-nymph. In other places the pendants form arch over arch. Here and there the coral extends to the surface of the water, as if the loftier columns were towers belonging to those stately temples that are now in ruins. There were countless varieties of diminutive trees, shrubs and plants in every crevice of the corals where water had deposited the earth. They were all of a faint hue, owing to the pale light they received, although of every shade and entirely different from plants that I am familiar with, that vegetate upon dry land. One in particular attracted my attention; it resembled a sea fan of immense size, variegated colors, and the most brilliant hue. The fish which inhabit these "Silver Banks" I found as different in kind as the scenery was varied. They were of all forms, colors and sizes—from the symmetrical goby to the globe like sunfish, from the dullest hue to the changeable dolphin.

—Journal of the Telegraph.

WANTED, A BUTTER WORKER.—Moore's *Rural* asks for a good butter worker, that will take the butter from the churn, wash, salt and work it without the aid of a butter bowl. If any such invention is in practical shape, or can be put in such a position, the owner or inventor may calculate on having a good thing. Is there not a chance here for some of our California inventors.

Silk Culture—The War.

The French and German war has already affected, more or less, nearly all kinds of business in this country—including agricultural industries. Should it continue much longer, or become more wide-spread, as the present position of things indicates that it may, the effect will be still greater and more lasting. The price of breadstuffs has already been materially enhanced in consequence of the war, and should Russia and England become involved—Russia being one of the greatest producers and exporters of wheat—the prospect for the farmers of the United States to obtain a high remuneration for their surplus wheat and flour, for a few years to come, is most flattering. An equally favorable effect would also follow to our manufactures and commerce. But of all our industries, none have been so directly and materially affected, by the present war, as those connected with the culture and manufacture of silk.

When it is considered that France is one of the foremost nations of the earth, both in the production and manufacture of silk, and that Germany is also extensively engaged in both of these industries, the reason for the facts above stated is obvious.

Strange as it may seem, however, while all other agricultural industries in this country have already felt an enlivening influence, consequent upon the war, silk culture, in California, has for the present, or so far as the immediate sale of the products is concerned, received a severe blow; and to those unacquainted with all the facts involved, or who have not given the subject a careful investigation, the prospect for this industry looks exceedingly dark and unpromising.

Before coming to this conclusion, we should examine these facts. At the commencement of the war there were orders in the State for all the silk eggs that had been or could be produced this season, and the prospects of the silk culturists for satisfactory profits were most gratifying. Quite a quantity of eggs had already been sold to agents of Parisian merchants, and the money had been paid for them, at from four to five dollars per ounce. Very soon, however, after the war began, all orders, not then filled, were countermanded; and even the eggs then already purchased are still in San Francisco, waiting an opportunity of shipment, which the present condition of France prevents.

This state of things has had an equally deleterious effect upon the egg trade in Japan, as we are informed by the late news from that country; and the present prospect is that nearly all the surplus eggs produced there and here will hatch in the hands of the producers, and thus prove to them a total loss. So much for the effects of the war upon the silk egg trade.

Now as to the cocoons and raw silk. The first impression would naturally be that the demand and price for these articles must necessarily be materially enhanced. We shall show hereafter that this will, in time, be the case; but for the present, it is quite the reverse. A moment's reflection will explain the reason of this apparent anomaly.

The silk crop of all Europe, the past season, was fully up to an average, and was secured before the beginning of the war. In times of peace, France not only manufactures all her own silk product, but by far the larger part of that of Italy, Spain and other European countries. She also imports largely from China, Japan and other Asiatic countries, to keep her looms at work. Now, however, all her factories are idle, and all their silk, usually consumed by them, is at present seeking a market in other parts of the world. As the silk factories outside of France are inadequate to consume so large a surplus, and the capital of the silk merchants insufficient to handle the same, the natural result is a present complete disorganization of the markets, and prostration of prices for the raw material.

We deem it proper to mention, here, another cause which has operated very much against this industry, in our State, and one which of itself was sufficient to completely discourage and dishearten a less enterprising and persevering people than Californians. We refer to the short-sighted, illiberal and unjust execution of the wise and judicious laws for the encouragement of silk culture in California, passed by our Legislature, some years

since. The course pursued by the State authorities in this matter deprived those engaged in the industry of the means they had calculated upon for pushing the business ahead, and operated, generally, much to the discouragement of others, who anticipated engaging in it.

Having alluded to and explained the cause of the present depression of silk culture in this State, we propose, for a moment, to look into the future, and examine a brighter and more promising side of the question. It is an old saying that "the night is darkest just before day." We believe that the brightest day for this rich industry in California is just about to dawn. We believe that the causes which have been and are just now operating so much to its disadvantage, will very soon bring about a complete change in its favor, and be the means of building up this industry upon a more firm and substantial foundation than its most sanguine friends ever anticipated for it. We refer to *legitimate silk culture—the production of silk itself.* And in the meantime, we believe we shall, after the war is over, enjoy a better chance to supply Europe with eggs than any other country. And now for the reasons for our belief.

In the first place so large a proportion of the world's silk manufacturing machinery and capital as is embraced in France can not remain idle for any length of time without necessarily being followed by a material rise in the price of silk goods. The unusual profits thus guaranteed to the manufacturer, by the great disparity between the prices of the raw material and manufactured silks, will attract the attention of capitalists and secure large investments in this direction. Thus will grow up a great silk manufacturing interest in our own country, and secure to us a constant home demand, at paying rates, for all our cocoons and raw silk. The signs of the times, the actual formation of silk manufacturing companies, the erection of factories point, with unerring certainty, to these results.

Again, even if the war does not assume any greater proportions in Europe, it can now scarcely be brought to a close in time for the French to secure eggs and produce a crop of silk the coming year. Should the war continue any length of time and the armies overrun the southern silk districts, as they now seem certain to do, the greater portion of the mulberry orchards of the Empire will be greatly injured or permanently destroyed. In that country of slow growth, these orchards once injured or destroyed, it will require a series of years to renew them so as to produce crops.

These facts and circumstances alone, without considering the injury to and destruction of the factories and machinery used in preparing the raw material—the reduction of the operators by the casualties of war, and the general disorganization of society and all the industries by the armies marching over this portion of the country, must necessarily, for years to come, reduce the products of this industry very materially in Europe, and produce a scarcity of the world over.

Thus it will be seen that there are at present a combination of causes most favorable to the cultivation and manufacture of silk in the United States, and especially in California, such as never before have existed. Added to these may be mentioned the great abundance and low price of mulberry trees in this state, and the great necessity of a greater number and diversity of industries for the general prosperity of the country.

We would therefore urge upon every farmer who has the land upon which to plant trees to make a beginning at once. It will cost but little and can scarcely fail to lead to good results.

Silk culture is an industry which proves most successful and prosperous when prosecuted as an adjunct to the farm, in connection with other occupations. No special buildings are necessary for cocooneries. A room in the house or in the barn or other outbuilding may be used for feeding the worms. The time employed will not interfere with other farming operations, as it will be needed when but little else is going on. In fact the feeding and care of the worms will prove a healthy recreation or pastime for the family, and the money thus made will be clear gain. We propose, in future numbers of this paper, to continue this subject, treating of all the different branches of the business, at such times as will render the most assistance to those engaged therein. The different articles taken together will prove a complete silk manual or guide for the use of the new beginner, and we hope they may prove of material benefit to individuals and the state.

Notes of Travel in Butte County.

[WRITTEN FOR THE SCIENTIFIC PRESS.]

Chico, the center of agriculture in this county, is situated midway between the Sacramento River, on the west, and the Table Mountain on the east. It is about 25 miles northwest of the county seat (Oroville), and 40 miles north of Marysville, from which place it is reached by rail. It contains nearly 4,000 inhabitants, and is one of the most prosperous towns in the State. It supports three good hotels—the Chico Hotel, Ira A. Wetherbee, proprietor; the Union House, B. F. Allen, proprietor; and the Junction Hotel, H. W. Cary, proprietor. Nothing will speak louder in the praise of these houses, and the prosperity of the place in general, than the fact that during my stay of a week in the place (and no excitement going on) there was not a bed to let in either, after 10 p. m. each day. The town has three fine livery stables, the two principal ones being owned by Messrs. Daniels & Hoole, than which there are no better anywhere. There are many fine stores here, in which everything is sold from a needle to a threshing machine. The principal dealer in agricultural implements is George F. Jones, who is the authorized agent for the sale of all implements made and sold by Treadwell & Co., of San Francisco.

Manufactures.

Messrs. Hallet & Loy are working some 15 men in the manufacture of chairs, tables, bureaus, bedsteads, wardrobes, picture frames, etc. Their machinery is driven by steam, and their establishment is stocked with the newest and most improved machinery now in use for such work.

C. F. Ellsworth also owns a mill, run by a 15-horse power engine. At present he is only sawing and planing, but intends soon to manufacture all kinds of wooden implements and wares. He also owns a large lumber yard, in which, at this present writing, there are 800,000 feet of lumber, and one million more of sugar pine at the railroad depot, close by, for shipping.

Principal Farms.

Among the principal farms here, may be mentioned that of D. M. Reavis, who owns a fine tract of land containing about 6,000 acres, situated two miles and a half west of Chico. He had 2,000 acres in grain last season, and will sow 3,000 the present season.

John Parrott, Esq., (San Francisco banker) is the proprietor of about 18,000 acres of beautiful land, lying 10 miles south of Chico, a small portion of which is situated in the edge of Colusa county, and upon which Messrs. Morehead & Griffith farmed 2,000 acres last year, and expect to put 3,000 in grain this year. Gen. John Bidwell is the possessor of about 20,000 acres of land next adjoining the town of Chico. He personally superintends the cultivation of about 2,500 acres, and raised last season about 45,000 bushels of wheat and barley. General B. also owns a fine grist mill, and has the finest country residence in the vicinity. He personally superintends his own affairs, and I believe has no enemies in a business way. Last, but not least in importance, comes what may be called the

Model Farm of Butte County.

This farm is situated three miles north from Chico, and is owned by H. Bay, Esq. It consists of 550 acres, all under cultivation. This is probably the most beautifully situated and best tilled farm in the State. Order—Heaven's first law—reigns there supreme. The visitor will find here a well dispositioned host, affable children, and gentlemanly and well skilled farm hands; and the best-blooded, heaviest roadsters, and best trained horses in the county. No plows, harrows, cultivators, sowers, mowers, reapers or threshers are seen here, lying around in fence corners, when not in use, but a building of the

proper construction and dimensions contains all. Some 10 acres are covered with dwelling house; servants' and workmen's houses; barns, stables, cribs, horse sheds, tool houses, etc., which have been constructed at a cost of about \$10,000. This last year 250 acres of wheat were harvested which averaged 32 bushels per acre.

Fine Stock.

Mr. B. has about 20 head of the finest breeds of horses in the State, including the descendants of Cheetham, Belmont, Lancet, Signal, John Morgan, Vermont, Corn-Planter, Imported Clydesdale, Rattler, Kentucky Hunter, and others. A hundred other points are worth mentioning upon this farm, and worth adopting by others, but time and space do not permit.

Splendid View.

Your Eastern Continent travelers, and commentators upon Swiss, and Italian scenery, should visit a point of rocks located about 1½ miles from Spanish Town, about 20 miles a little east of north from Oroville, in this county. From this point, on a clear day, you can see the meandering of the Sacramento River for over 100 miles, and can see the same steamer sailing nearly the whole day. The Marysville Buttes are to be seen in the foreground; Mount Shasta, to the north, is in full view, while Mount Diablo is in full view to the south; and Lassen's Butte, the snow-capped top of which is visible by walking 10 steps, may be seen to the northeast. I know of no other place in this State where so many prominent points can be seen from one view.

A New Oil.

Messrs. Yokum & Jones, of Chico, are the inventors of a new oil called "Naph-alta." As to its merits I know nothing, but its inventors claim for it extraordinary cheapness, safety, and a beautiful light. They also claim that it will not only burn in a common oil lamp, but may be also burnt as a gas.

Dayton

Is a thriving little village, some eight miles south of Chico. It has as yet no postoffice, but the population have to depend on Chico for their mails. An Odd Fellows' Lodge, organized there the 6th day of August last, now contains 29 members. Some 50 farmers, who till from 100 to 1,000 acres each, live in the vicinity. Colusa will be noticed in my next.

Turkeys, per lb.	10	15
Soap, Pale and Yellow, per lb.	10	15
Soap, Castile, per lb.	18	20

WASTE OF FRUIT.—A recent number of the Marysville *Appeal* very properly deprecates the great waste of fruit in this state by allowing to rot by tons in nearly all our orchards, as a fair example of the wilful waste so peculiar to this country—a waste which anywhere else would bring "woeful want." Fruit in excess of the market demand should either be fed to stock or dried.

Household Reading

Taking Cold.

The human frame is intended for activity. If we sit still in a close, warm room, we take cold much more readily than when we stir about in the open air. Men seldom take cold who work out of doors; colds among miners are much less frequent than among such mechanics as work most of the time in-doors. A writer in *Technologist* compares the human body to a locomotive which is intended for activity—to be kept in motion—to run fast or slow as desired; but it must be "managed." "A locomotive can run very fast, but if stopped instantaneously when going at a high rate of speed, it is uninjured as badly as if it had had inflammatory rheumatism for seven years. A skilful engineer, however, tones down his speed gradually; and in this lies the whole secret of not taking cold. It is exposure, or carelessness, after exercise that brings on colds. After walking, or running, or dancing, or any exercise that quickens the circulation, a little current of air from a window, a crevice, from an open door, for a few minutes, just to cause a chill, is sure to produce cold. Merely stopping on the street in a current of air—as at a corner where the wind breaks or makes an angle—will do the job. Any sudden subsidence of active forces of the body in a temperature that chills will produce cold. The little common sense that is needed, and for the lack of exercise of which so much money is paid to doctors, is to preserve an equable temperature, or, having exercised freely, to recover the proper state gradually and without a chill. This is attained in a most simple and easy manner. After exercise, always seek rest in a sheltered place, where you will be warm, never being hasty to remove hat, gloves or cape. Let perspiration subside before disrobing, if indoors; and if outdoors, always keep gently moving until the usual condition is attained.

RIGHT AND LEFT STOCKINGS.—There is a stocking made in England called the "Right and Left Stocking." These stockings are made to fit each foot just as a boot does, thus affording more freedom to the toes than can be obtained from stockings of the ordinary make and shape. They are also more durable, because their exact fit to the foot does not permit of any considerable rubbing or chafing. For these reasons they are much easier to the feet, and are especially desirable by those who have to walk much. The most of the stockings made in this country are abominable things, especially those made by machinery.

THE ANCIENT AND MODERN USE OF HONEY.—Honey was regarded by the ancients as a special gift of the Gods; accordingly their poets chanted its virtues in verse, and men made libations of it upon the tombs of those who had been dear to them. It was poured upon the altars and upon the heads of the sacrificial victims. We moderns prize it equally as much, and make a similar though more sensible use of it—we use it in libations upon buck-wheat cakes!

A NEW CURE FOR CONSUMPTION has been introduced at Boston, called the "Atmospheric Treatment." It consists in immersing the body, below the neck, in a partial vacuum. It is thus relieved, in a measure, from atmospheric weight, while the air breathed is still of the usual density. It is claimed that the patient under these circumstances breathes fully and freely to the very depth of his chest, bringing into action portions of the lungs otherwise little used, and increasing accordingly the purification and revivification of the blood as it flows through the passages of the lungs.

LOOK TO YOUR GINGER.—A Boston chemist says that burnt sole leather enters largely into the composition of the ginger put up in packages.

IS IT ANY WONDER?—The average weight of a lady's dress which is supported from the waist is about 15 pounds. Is it any wonder that weak backs are so numerous? Put on suspenders, girls!

SALT WITH NUTS.—It is advisable always to use salt with nuts, as that is necessary to produce their easy digestion.

Caution in the use of Chloral.

Caution should be observed in the use of the new hypnotic (sleep-producing) known as hydrate of chloral, now so largely advertised, and which is coming into such general use. It is undoubtedly a most useful preparation, and one which will prove a great boon to man; but medical men do not yet fully understand its effect upon the human system. A writer in the *London Lancet* gives the following facts with regard to the effects of an excessive use of it: "The party had tried all other hypnotics; but found them either ineffectual to produce sleep or followed by injurious effects. But Chloral succeeded admirably, and he enjoyed the great luxury of sleep. Soon, however, he found that his dose of 20 grains was insufficient. One night he took a drachm at 11, but awoke hot and restless at one. He took another dose of the solution without lighting a lamp; and soon after, when in quite a stupid condition, yet a third large dose. He then sunk to sleep immediately, and slept till 10 o'clock, when he was awakened with difficulty. A servant had entered the room at six and found him snoring loudly. On attempting to rise, he found that he had no control over his legs from his knees down, and could not dress or walk without the aid of his servant. The rest of the body he had the use of. After a hearty breakfast the unsteadiness gradually wore off. On measuring the bottle, he found, to his astonishment, that he had taken, between 11 and 2 o'clock, seven drachms of chloral. A similar blunder with any other narcotic would have produced death. We hear of a case where chloral was given to produce anesthesia in a surgical operation, after which recovery was much less satisfactory than after chloroform."

DIAMOND FIELDS OF GEORGIA.—A correspondent of a Gainesville paper says: We are glad to see in the Northern and European papers that much excitement prevails on the subject of South African diamonds, which are now being found over a space of 1,000 square miles, of great value. This will react on our section, which, from every geological indication, and its peculiar mineralogy, will ultimately, when developed, yield more and finer ones than South America and Africa. Our opinion is predicated on the fact of over 40 having been picked up by the gold-washers in every deposit mine from Hall county, Ga., for 600 miles to Virginia, some of which were of much greater value than any yet found in Africa. All we want is a little capital—one or two thousand dollars—to develop the fact again and draw the attention of capitalists to the subject, who can introduce diamond miners, who understand washing them. By this course, I have no hesitancy in saying that, in six months, the most brilliant success would attend the experiment.

STRYCHNINE, ETC.—It is one of the phenomena of the animal system that different food and medicines frequently act differently upon different individuals. Strychnine, in particular, which is so deadly to human beings and to nearly all dumb animals, may be eaten with impunity by monkeys and goats. Similar conditions with regard to the effects of some other drugs upon certain animals are noticed. For instance, it is alleged that pigeons can eat opium with impunity, and goats tobacco; while rabbits are not injuriously affected by either belladonna, stramonium or hyoscyamus. It would, moreover, appear, from the first above mentioned fact, that monkeys are not quite so nearly related to man as some people seem anxious to prove them.

DANDRUFF IS CAUSED by wearing close and heavy hats or caps, by the application of oils or dyes to the hair, by excessive brain labor, or uncleanness, or by all these causes combined. To effect a cure, wear the hair short, let the head covering be as light and well ventilated as possible, avoid all applications of grease or dyes, exercise the brain less and the body more, and wash the head thoroughly two or three times a day in cold water, and follow each washing with a vigorous rubbing with the balls of the fingers. The better the general health is and the stronger the digestion, the less tendency there will be to this disease, as well as others.

Household Receipts.

FOR MAKING HARD SOAP.—Put six pounds of soda ash, six pounds of grease, and three pounds of lime into four gallons water. Boil the soda and lime in the water until the soda is dissolved, then pour it out and let it settle. When the dregs are all in the bottom, pour the top off into an iron pot, add the grease and boil until it is soap; when sufficiently thick, pour into pans to cool, and cut into bars.

TO MAKE SAUSAGES.—Thirty pounds of chopped meat; eight ounces salt; one-half an ounce of salt-petre; two tea-cups of sage, and one and three-fourths cups of sweet marjoram. Pass the two last through a fine sieve. If you prefer it, thyme and summer savory may be substituted for the latter.

DYSPEPTIC'S BISCUIT.—Take Graham flour (wheat coarsely ground, without bolting), two quart; corn meal sifted, one quart; butter, half a cup; sour milk to wet it up, and saleratus as for biscuit. Roll out and cut with a tea-cup and bake as other biscuit, and when cold they are just the thing for dyspeptics. And if the flour was sifted, none would refuse to eat them.

RAISIN PIE.—One cup chopped raisins, one-half cup sugar, one-half cup molasses, five round crackers rubbed fine, one-half cup butter, two tea-spoonfuls cinnamon, one tea-spoonful cloves, one-half tea-spoonful pepper, a little salt, one-half cup sugar, five cups boiling water.

STEAMED JOHNNY CAKE.—One cup molasses, two cups sour milk, two cups sweet milk, four cups cornmeal, one cup flour, one table-spoonful soda with salt. Steam four hours.

TO HARDEN A POKER.—The fire poker, by constant use, becomes soft, and is generally more or less bent. This arises from its being left in the fire and becoming hot, then being put on the fender, where it slowly cools, an operation which softens the best steel. When a poker has thus become soft and bent, it may be again hardened by making it hot two or three times, and plunging it every time into a pail of cold water. The sudden cooling of steel makes it again hard.

INDELIBLE INK.—The following recipe is from the *Deutsche Industriezeitung*: Dissolve four parts of aniline black in 16 parts by weight of alcohol, with 60 drops strong hydrochloric acid, and dilute the dark-blue solution with 90 parts by weight of water, in which six parts of gum arabic have been previously dissolved. This ink does not act upon steel pens, or suffer any alteration by alkalies or acids.

TO REMOVE STAINS—those of grass, grape-juice, and the like—from white garments, dampen the spot, and hold it over the fumes of a lighted sulphur match.

Mechanical Hints.

TO ENGRAVE FIGURES ON GLASS.—Cover one side of a flat piece of glass, after having made it perfectly clean, with bees-wax, taking care that every stroke cuts completely through the wax. Next make a border of wax all round the glass, to prevent any liquid when poured on, from running off. Now take some finely powdered fluate of lime (flour spar), strew it evenly over the glass plate, upon same side, and then gently pour upon it, so as not to displace the powder, as much sulphuric acid, diluted with thrice its weight in water, as is sufficient to cover the powdered flour spar. Let everything remain in this state for three hours, then remove the mixture, and clean the glass by washing it with oil of turpentine. The figures which were traced through the wax will be found engraved on the glass, while the parts which the wax covered will be uncorroded.

TO REMOVE LIME.—To remove lime which gathers in tea kettles, fill the kettle with water put in one-fourth of a pound of Spanish whiting, and boil until the lime is removed.

TO MAKE PLASTER OF PARIS STICK TO MILL STONES.—Various devices are employed to make plaster of Paris stick hard on mill stones, etc., among which the following are the most effective and practical: First, boil the plaster till the bubbling ceases, or till quite dry; then mix in a little powdered alum, then mix with water; apply quickly, as it sets rapidly, becoming very hard.

Another method is to mix the plaster with iron filings before wetting; this is the best, as any one can notice the plaster near the hoop of the stone to be much firmer than at any other part.

Life Thoughts.

BETTER be upright with poverty than unprincipled with plenty.

TENACITY of purpose is the indispensable condition of success in whatever you undertake. You must learn to hold it.

It is one of the worst of errors to suppose that there is any other path of safety except that of duty.

It is always in our power to make a friend by smiles; what a folly, then, to make an enemy by frowns.

DIFFICULTY excites the mind to the dignity which sustains and finally conquers misfortunes, and the ordeal refines while it chastens.

FAULTS.—If you would find a great many faults, look upon the outside. If you would find them in still greater abundance look within.

AN open mind, an open hand, and an open heart will find everywhere an open door.

TALENT alone, is only the rough metal; it is diligent industry which works it, and ascertains its real worth.

EXTERIOR beauty is a recommendation, written with such pale ink, that time effaces it.

THE manners which are neglected as small things are often those which decide men for or against us.

INDUSTRY will make a purse, and Frugality will give strings to it. This purse will cost you nothing. Draw the strings as Frugality directs, and you always will find a useful penny at the bottom.

GOOD BREEDING.—Good breeding and soft words have been not inaptly compared to cotton and other soft material placed between china or glass ware to prevent injurious collision.

THE PURSUIT OF HAPPINESS.—It is a great blunder in the pursuit of happiness not to know that we have got it—that is, not to be content with a reasonable and possible measure of it.

Beautiful Extract.

The influence of Christianity on society is not exerted through the cannon of the warrior, or the dispatches of the statesman, but in the sweet breathings of truth that come on the opening petals of the breast of infancy, like spice-laden zephyrs from the land of the blest—in the gentle words of love that fall in dewy freshness on the wandering ear of childhood, from grey-haired sires and sweet-voiced matrons—in the nameless tellings of high and holy things, wrapped in the deep, unutterable voices of the ancient eternities that come to the silent ear of youth, before the din and strife of the babbling world have stunned these inner senses of the soul—in the longing and wistful thoughts of things of deep, abysmal mystery that steal into the soul in its lonely musings in the solitary chamber—in the deep hush of the morning forest—in the awful silence of the hollow midnight—in the seasons of gloomy doubt and frantic effort to scale the prison wall of mystery and darkness that rises and closes in encircling silence around all—in times of heart-sickness and disappointment, when reaching forth the hand of warm, confiding trust, it grasps the cold and slippery skin of the adder—it is then that Christianity with its wonderful tellings of infinite things, comes with apocalyptic splendor and power, and revealing itself to the soul, creates those martyr spirits that stamp their lineaments on the enduring rock.

INDUSTRY is the natural sure way to wealth; this is so true, that it is impossible an industrious free people should want the necessities and comforts of life, or an idle, enjoy them under any form of government. Money is so far useful to the public as it promoteth industry; and credit, having the same effect, is of the same value of money; but money or credit circulating through a nation, from hand to hand, without producing labor and industry among the inhabitants, is direct gaming. —Berkley.

SWEET ANSWER.—A little boy and girl, each probably five years old, were by the roadside. As we came up, the boy became angry at something, and struck his playmate a sharp blow on the cheek, whereupon she sat down and began to cry piteously. The boy stood looking on sullenly for a minute, and then said: "I didn't mean to hurt you, Katie; I am sorry." The little rosy face brightened instantly. The sobs were hushed, and she said: "Well, if you are sorry, it didn't hurt me."

Scientific Press.

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers.

A. T. DEWEY. GEO. V. STONE
W. B. EWER. JNO. L. BOONE.
Office, No. 414 Clay St. below Sansome.

Two Editions.—We now issue a mining edition and a farming edition of the Press. The difference consists in changing the reading matter of the 6th and 7th pages. (All advertisements appear in both issues, affording an immense circulation.) Subscribers will please notify us if they do not receive the edition they prefer. Both editions furnished to one address for \$7 per annum.

San Francisco:
Saturday Morning, Dec. 17, 1870.

Table of Contents.

Boating, Paper Boats, Ill.....409	Asphalt Pavement.....416
Australian Subsidy.....409	Gold and Silver near Home.....416
About Montana.....410	Coal in Nebraska and New Mexico.....416
Metallurgical Experiments.....410	Montana Irrigating Canal.....416
The Deepest Shaft.....410	Full List of Patents.....417
Silver in the Sea.....410	Notices of recent Patents.....417
MECHANICAL PROGRESS—	Mineral Statistics.....417
Hydraulic Machinery on Steamships; Photographs; Printing; Tool Steels and Low Steels; Wood Preserving Process; American Hardware; Coal Prospecting; Horse-shoe Machine, Largest Turbine.....411	Curious Mining Economy.....417
SCIENTIFIC PROGRESS—	Climate of Coal Period.....420
Sky Matter; Electric Light in Paris; Eclipse; Helmholtz on Faraday; Corona; New and Marketable Coal.....411	S. F. Metal Market.....423
FARMING AND GARDENING—	N. Y. Metal Market.....423
Silk Culture and the War; Notes of Travel in Butte County; Waste of Fruit; S. F. Market Rates.....414	EXTRA CONTENTS IN MINING EDITION.
HOUSEHOLD READING—	MINING SUMMARY.—Items from various counties and districts in California, Arizona, Idaho, Montana, Nevada, New Mexico, Utah.....412, 413
Taking Cold; Right and Left Stockings; Honey; Caution in using Chloral; Diamond Fields of Georgia; Strychnine; Dandruff; Household Receipts; Mechanical Hints; Life Thoughts; etc.....415	Shareholders' Directory.....413
Mechanics' Institute—Quarterly Report.....416	S. F. Stock Market.....413
	New Incorporations.....413
	EXTRA CONTENTS IN FARMING EDITION.
	Training Grape Vines; Agricultural and Horticultural War; Beet Sugar Factory for San Jose; California Agricultural Notes; Eastern Agricultural Notes; What I know of Farming; S. F. Produce Markets.....412, 413

Gold and Legal Tender Rates.

San Francisco, Thursday, Dec. 15, 1870.—Legal Tenders buying @90½; selling @91. Gold in New York to-day 111.

Mechanics' Institute—Quarterly Report.

The regular quarterly meeting of the Institute, which had been adjourned from the preceding Saturday, was continued on the 8th inst. From the reports, it appears that the late Horticultural Fair at the Pavilion netted \$1,579.72, and gave rise to a Horticultural Society. The President advised that additional premiums be offered for the Fair of 1871. The Mechanic Arts College lectures have thus far proved a great success. During the quarter ending Dec. 1st, 1870, 389 new books have been received; and on account of the increased attendance at the Reading Room, enlarged accommodations are desirable. The Committee on Ways, Means and Accounts reported the expenditures of the last quarter as \$3,131.43.

The Treasurer's report shows a gratifying increase in memberships and receipts. The receipts are as follows:

Institute Fund.....	\$3,138 75
Sinking Fund.....	1,679 61
Pavilion Fund.....	2,695 47
Total Receipts three months.....	7,563 83
Disbursements.....	5,584 72
Balance on hand.....	1,979 11

Notice was given of an amendment to the Constitution, providing for honorary membership, as proposed in the President's report. Mr. W. Williams was elected Trustee to fill a vacancy in the Board.

GIANT POWDER EXPLOSION.—A correspondent sends us the following from Nevada City, under date of December 8th:—Wm. Maltuan, one of our most extensive and successful hydraulic miners, was blown up and instantly killed by an explosion of giant powder this afternoon at about 3 o'clock. It is supposed he was drying some wet powder on the blacksmith fire. The shop, a large building, was completely demolished. The accident cast a deep gloom over the mining community hereabouts.

Asphalt Pavement.

There are few subjects of greater importance to residents of metropolitan cities than good pavements and roads, and this is especially the case in San Francisco. Upwards of a million dollars are annually collected from the property-owners here to keep their public streets in order, a purpose which signally fails of accomplishment for want of suitable materials. There is probably no other city in the United States in which there are so many experimental pavements in use, as here. We have Cobblestones, Russ, Macadamized, Nicholson, Stow, and several others,—not one in use filling the requirements of a really good pavement, which are solidity, durability, cleanliness, noiselessness and smoothness without being slippery.

The peculiar climate of San Francisco, with its long seasons of drouth and heavy rains, renders the matter of getting a proper wooden pavement one of great difficulty. We have a variety of kinds in use, but they have as yet failed to give satisfaction, and no process has been devised for properly preserving them. It is too much to say that none ever will be devised, but we must wait an indefinite time for future chemical discoveries before we can expect a suitable wooden pavement. One has only to read the answers to questions propounded by the Board of Supervisors to eminent engineers and scientists, to get an idea of the unsatisfactory state of our present knowledge of the subject. The Stow pavement has answered the required conditions here better than any other, yet this cannot be pronounced a success; and the new blocks being harder than the old ones, repairs are very difficult, to say the least.

Cobblestones are destructive to both animals and vehicles, and cannot be laid to retain a permanently even surface, necessary to insure good surface drainage. Moreover, such a pavement causes an intolerable noise, and requires continual repairs.

Macadamized roads are impossible in this vicinity owing to the want of material sufficiently hard to stand the wear of heavy teams. The best of the present macadamized roads, are but little better than mud banks in winter, and the source of dust during the summer.

The Russ pavement is a failure owing to the unequal wear of the blocks.

Planking is not only a temporary expedient, but the continued rotting of the materials is very injurious to the general health.

The streets of Paris, covered with asphalt, present the nearest approach to perfection of paving and paving material. There are in that city nearly 500,000 square yards of road, and upwards of 2,500,000 square yards of sidewalks made of asphalt. Much of it has been in use since 1854, and exhibits but little evidence of the immense traffic which has passed over it during sixteen years. The wear is so trifling that mud never forms, and dust is almost unknown in that city.

The French "Asphalt" is a very different article from the "Asphaltum," so abundant in this State. The French article is a peculiar form of limestone, containing a small percentage of bitumen, which, being subjected to heat sufficient to boil water, crumbles into a fine sand, and loses its carbonic acid gas. This bituminous sand while hot may be moulded into any desired form, and when cool is said to be as hard as any of the granites found on this coast. The advantage of such a material for paving purposes cannot be over-estimated, and it is being generally adopted by the metropolitan cities of Europe.

The "asphaltum" of this coast is composed of bitumen, oily and earthy matters, and consequently differs entirely from the French article.

Mr. Foye, a gentleman of great experi-

ence in such matters, after many experiments, has found that the bitumen extracted from the California asphaltum, combined in proper proportions with pure lime, makes an "asphalt" equal in every respect to the best French article. A caveat was filed, nearly two years since, for a patent for his process, and the patentee will soon be prepared to lay down genuine asphalt pavements in this city.

This gentleman claims that by certain mechanical contrivances of his invention, the bituminous gases, generated by heating asphaltum in closed tanks containing pulverized limestone, displace the carbonic acid gas of the limestone and convert the residuum into a material, that, while hot, can be moulded into any desired form, and is better adapted for paving, foundations of buildings and submarine work than ordinary cut stone; being impervious to moisture and capable of sustaining as great a pressure as the best granite. The product of this process is very different from the asphaltum used for sidewalks, as it contains neither sand nor pebbles.

It is much to be regretted that, in consequence of a dispute between the parties who lay down the asphaltum sidewalks, now in use, (made under what is known as the Skinner & Bonnett process) and Mr. Foye, (who claims that these parties infringe on his rights), there will be some delay in laying the new pavement.

The ground of dispute is that Skinner & Bonnett claim a "chemical compound" in their preparation of the materials, whereas Mr. Foye has been granted a patent for his process and product.

It is to be hoped the dispute may be soon settled, as it is imperatively necessary that a radical reform be introduced in our street pavements as soon as possible.

GOLD AND SILVER NEAR HOME.—On San Jose Creek, the head-waters of Fruit Vale Creek, about 3½ miles from Brooklyn and 13 miles from San Francisco, Mr. Albert Eldred is energetically driving a tunnel which is already in over 80 feet. A large vein of rock containing sulphurets has been struck, and we are assured that assays of this rock and of rock from neighboring veins have afforded satisfactory results. Mr. Eldred has some 400 acres of land in his ranch, on which the works are located. He has already over a ton of selected ore on the dump, which is to be brought to this city and treated. Although not over-sanguine as to the existence of rich gold and silver fields at our doors, yet we shall be interested to hear of the results obtained. Mr. Eldred is certainly working away with a will.

Mr. Geo. May, we are told, is at work on a ledge, a mile or so from Mr. Eldred's place, across the hills, and is taking steps for the immediate erection of a quartz mill. We should advise him strongly to develop his ledge before he puts his money into a mill.

MONTANA IRRIGATING CANAL CO.—This company has organized and has taken preparatory measures for constructing their new canal for irrigating and mining purposes from some point below the cañon on Jefferson River. The initial surveys are now being carried on. The *Helena Herald* (which, we see, commenced its fifth volume on the 1st inst.) speaks thus of the project: The company propose to build this canal with a capacity sufficiently large to carry fifteen thousand inches of water, tapping the Jefferson at a point that will give a convenient and ready flow to the artificial stream by way of the Crow Creek, Indian Creek, Beaver Creek, and Spokane valleys, and on to the Prickly Pear valley. Aside from the vast area of exceedingly rich gold placer ground, lying between Indian Creek and Helena, and which this canal will thoroughly cover, there are tens of thousands of acres of now worthless lands which can be brought under a high state of cultivation by the irrigating process, which this watercourse will render entirely feasible.

Significant.

There is a little fact connected with the establishment of our new paper, the PACIFIC RURAL PRESS, which we may be permitted to state here, as, although a private matter, it is one which has a general significance for our readers. The very first outside order received for that paper came from the mountain region—from Strawberry Valley, up in the extreme northern part of Yuba county. This shows how agriculture is creeping surely up into the higher regions, where it retains a strong foothold, and, while flourishing, benefits greatly the mining and other interests, and opens new fields of industry for our community.

We may be permitted to state another little fact in this connection. The order enclosed the money to pay for the paper—the first pecuniary aid received (a month before the first issue) in this way for the new enterprise.

THE LARGEST ARTIFICIAL GRINDSTONE ever successfully made, so far as we know or can learn, was made on Thursday of last week, at the works of the Pacific Stone Company, by the Ransome process. This is 12 inches thick and 5 feet 10 inches in diameter, and weighs over one and a half tons. It was manufactured for the Eureka File Works of this city. The company has filled quite a number of orders for grindstones for the foundries and other works in this city, and, we understand, give the best of satisfaction.

CONGRESSIONAL.—On the 13th inst., Mr. Julian, in the House of Representatives, introduced a petition from settlers on public lands, in Colusa County, California, protesting against the lands being taken from them by capitalists as swamp and overflowed lands. In the Senate, Mr. Carpenter introduced a bill amendatory to the act to confirm certain private land claims in New Mexico. This last was referred to the Committee on Private Land Claims.

COAL IN NEBRASKA.—The St. Louis Democrat, of Nov. 30th, says: The people of Omaha, and at other places throughout Nebraska, have become very much interested in the subject of procuring, if possible, a home supply of coal. To the present time the mineralogical researches in this direction have failed to discover any outcroppings, or any subterranean veins of sufficient thickness to pay for working. The State has therefore been forced to procure its fuel from the mines outside its boundaries. To further agitate the subject, an address was recently delivered before the Omaha Board of Trade by Dr. Hayden, geologist and mineralogist. He informed his audience that the coal of Nebraska is probably in the western rim of the great coal basin. By tracing the formation from surrounding States and Territories, it becomes apparent that in the vicinity of Omaha there can be no coal at any less depth than six or eight hundred feet. If a deposit were found at such a depth, and in a vein of sufficient thickness, it would pay for working. The speaker, in concluding his remarks, suggested the appropriation of six or seven thousand dollars by the city for settling the vexed question, as the result would be of the greatest importance to the residents and manufacturers in that vicinity.

COAL IN NEW MEXICO.—Mr. W. A. Wagner, late coal surveyor of the Union Pacific Railroad, has been engaged to survey and make a full report of the various coal mines on the Maxwell Grant. These coal mines will, beyond doubt, be a source of very great profit to the company. When a railroad passes through here, as it soon must, the demand for coal will be great and continual, and the yield to the company will be quite munificent. There are those, indeed, and practical men, too, who declare that the coal deposits on the grant are of themselves worth much more than the entire cost of the grant.—*Cimarron News*.

SUSPENDED.—We regret to hear that the *Press and Telegraph*, of Elizabethtown, New Mexico, has been suspended temporarily on account of private difficulties of a legal nature. It is announced by the editor that a new and improved paper will be issued in a few weeks.

Patents and Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.]

FOR THE WEEK ENDING DECEMBER 6TH.

DIRECT-ACTING STEAM-ENGINE.—William Davis Hooker, San Francisco, Cal.
TIME FOR TRACTION-ENGINE.—Oliver Hyde, Oakland, Cal.
SAWING-MACHINE.—Per Johnson, Columbia, Cal.
CUTTING FOR EARTH-BORING AUGERS.—Thomas Oreland, Lincoln, Cal.
CAR-COUPING.—Jay R. Palmer, Mariposa, Cal., assignor to himself and James H. Hatch.
BEE-HIVE.—Robert A. Williams, Colusa, Cal.
HARVESTER-RAKE.—Hiram H. Seoville, Oakland, Cal., assignor of one-half interest to Joseph A. Seoville.—Patent No. 23,613, dated April 12, 1859.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of mention:

GENERATING GAS FROM HYDRO-CARBONS.—J. R. Smedberg, S. F. This matter has been the subject of so many patents that many are accustomed to look upon any new "improvement" with considerable mental reservation. It is therefore but justice, in the present case, to call attention to the excellent qualifications of Mr. Smedberg, who has had extensive experience, both theoretical and practical, in large gas establishments. Mr. S. has made many improvements in gas manufacture, has written some very good articles on the subject to our excellent cotemporary, the *Gas Light Journal*, and is now busy compiling his "Synopsis of British Gas Lighting." All this in addition to efficiently performing his duties as consulting engineer of the S. F. Gas Works. His process of gas-generation consists in subjecting the petroleum used to a very high temperature in the retort, by which the resulting gas is rendered permanent, and also in a novel manner of introducing the oil into the retort, so that the temperature of the latter may not be reduced in vaporizing the oil. It consists, moreover, in a peculiar self-regulating feeding-apparatus, by which the flow of the oil is rendered at all times uniform. A water-jacketed seat is employed to prevent the return of gas through the supply-pipe, and also to prevent the vaporization of the oil in the pipe by the heat.

SAFETY HALTER FOR HORSES.—Augustus Le Plongeon, S. F. Man, the ruler of the brute creation, sometimes finds his subjects growing restive under his sway. Lately the equine subjects in San Francisco have carried their restiveness so far as to bring their masters in ignoble contact with the earth, on occasions which have grown too frequent to be pleasant of contemplation. Hence, for this city at least, the present invention comes opportunely. This consists of two cheek-pieces, to one end of each is hinged a nose-piece, curved so as to fit over the horse's nose, just above the nostrils. There is also a jaw-piece fitting under the lower jaw. On the inside of the cheek-pieces are circular knobs or projections in the proper position for clamping upon each side of the nostrils. Proper springs keep these different pieces apart, and reins or straps, leading to the rider or driver, enable him to bring them into action. If the animal prove rebellious, by drawing upon these straps the cheek-pieces are closed on the horse's cheeks, thus pressing the knobs on his nostrils, the jaw-piece effectually closes his mouth, and the unruly subject is rendered decidedly incapable of further revolutionary acts.

SEWING THIMBLE.—A. H. Law, S. F. This ingenious device was illustrated in the Press of September 24th, and our readers will there find a full description.

IMMIGRATION TO NEW MEXICO.—A mass convention of the citizens of New Mexico was to have been held at Santa Fe, on Nov. 26th, to devise means of inducing immigration; also to make arrangements for the collection of statistics concerning the mineral, agricultural and other resources of the territory.

Curious Mining Economy.

The use of sperin candles in the mines underground is a cause of expense well known to all connected with mining. The attempt has been made to reduce this expense by substituting oil lamps, as used in Germany and elsewhere in Europe; but our miners, finding the candles more convenient, would not allow the introduction of lamps. The Mexicans, more ingenious in cutting down expenses, and being at the same time complete masters of their mines, have succeeded in reducing 50 per cent. the item of their dull-burning tallow candles, by simply refusing them to the *tanateros* (the men who carry the ore out of the mine). These fellows, being obliged to work for their living, have found quite a singular and effective method, which enables them to go through the drifts and shafts, with their burden attached to their heads, without candles.

Although their method is not very likely to be imitated in this country, it is nevertheless sufficiently interesting to be mentioned here. Mr. O. Hofmann, when in Trinidad, Mexico, observed a young *tanatero* coming out of the mine with a load of ore on his back, who was apparently blind of one eye. The next one who followed had the same misfortune, and Mr. Hofmann wondered at the singular coincidence of two one-eyed miners. But he was still more astonished when the third one appeared, exactly like the preceding two,—and this was not all; still more *tanateros* emerged from the shaft, one after another, each having only one eye open. Hofmann thought he was dreaming of the Arabian Nights.

The foreman, seeing his surprise, explained the matter. He said the candles belonging to the *tanateros* (who drill and blast), do not give sufficient light in the drifts, where it is consequently quite dark, but where, nevertheless, the *tanateros* see well enough not to run their heads against the rocks. But on emerging into daylight they would be blinded did they not take precautionary measures. For this reason, as soon as they approach the mouth of the shaft, at the point where they catch the first glimpse of light, they drop the eye-lid of one eye, and keep this down while discharging their ore, and until they have re-descended the shaft. When they are again in the dark, they open the eye, kept hitherto in reserve, and at once they see everything distinctly; while the other eye, previously open and blinded somewhat by the daylight, perceives nothing at all.

The correctness of this fact can be easily proved by covering one eye with a handkerchief, when the lamp or gas is lighted in the evening, spending about 10 minutes in the room, looking occasionally at the light with the other eye, and then going into a dark room. On removing the handkerchief, one can distinctly see objects with the previously covered eye which cannot be discovered by the other one.

PACIFIC LAW REPORTER.—We have lately received this journal, the name of which explains its scope. We should imagine that it would prove an invaluable paper for lawyers. The publishers announce that it is their intention to make it a reporter in every sense of the word, and not a law magazine expressive of editorial ideas. The *Reporter* will be issued once a week, with a daily supplement to every city subscriber free, at \$150 per month. Wm. Ayres & Co., Publishers.

U. P. R. R.—It is almost a certainty now, says the *Dallas Mountaineer*, that the Northern Pacific Railroad will pass through the Snake River Valley, instead of over the high mountains of the Pen D'Oreille like on Mullen Wagon Road routes. At the next session of Congress the company will ask to have the route changed.

MINERAL STATISTICS.—During the year 1869, there were raised in Great Britain 107,427,557 tons of coal, valued at \$134,284,410; 11,508,525 tons of iron ore, valued at \$18,662,800; 129,953 tons of copper ore, valued at \$2,539,560; 96,866 tons of lead ore, valued at \$5,945,150; 15,533 tons of zinc ore, valued at \$2,688,300; 14,725 tons of tin ore, valued at \$5,139,025; 75,948 tons of iron pyrites, valued at \$205,115; 1,200,000 tons of clays, valued at \$2,250,000; 1,250,000 tons of salt, valued at \$3,437,500; and of other minerals sufficient to bring up the total value to \$176,260,600. From the ores were extracted 5,445,757 tons of pig iron, 8,291 tons of copper, 73,250 tons of lead, 4,500 tons of zinc, 9,760 tons of tin, 831,891 ounces of silver and 18 ounces of gold, besides other metals. Total value of metals produced, \$88,228,835. The absolute total value of the metals and coal, with other minerals (excepting building stones, lime slates and common clays), produced in Great Britain in 1869, amounts to \$232,248,445.

AUBURN MILLS.—The *Reno State Journal*, a promising new paper, has been permitted to examine the books of the Auburn Mills, at Reno, and gives a list of certain lots worked there from various districts, to "show that the rich ores of the country are not yet exhausted." We should have preferred to see a representative list, with working results, etc., but from the material offered prepare the following. The first column gives the total number of tons and the last the average value per ton from the localities mentioned.

Tons.	Locality.	Per Ton.
55 1/2	Aurora and Mono Counties, Cal.	\$368 1/2
2	Kern District, Nevada	47 1/2
31 1/2	Salt Lake, Utah	67 1/2
10	Silver M. Co., Unionville	292
37 1/2	Mineral Hill, Nevada	571 1/2
8	Bull Run District, Nevada	300
59	Pinto District, Nevada	240 1/2
55	Battle Mt., Butte S. M. Co.	327 1/2
19 1/2	Enoch District, Nevada	241
8	Cope District, Idaho	291 1/2
158 1/2	Virginia City, Nevada	505 1/2

The lots range from 158 to 221,323 lbs. The lowest value per ton, in the lots selected by the paper referred to, was \$157 54; the highest, \$2,906 74,—that of a lot of 2,827 lbs. from Salt Lake.

LIGHT-HOUSE AT CAPE BLANCO, OREGON.—The Light-House Board give official notification that a *fixed white light*, of the 1st order of the system of Fresnel, will be exhibited on and after Dec. 20th, 1870. The tower is 50 feet high, of brick, painted white, and situated 200 yards from the extremity of the Cape. The dome of the lantern is red. The light is 256 feet above the mean level of the sea, and should be visible ordinarily from the deck of vessels 15 feet above the water, at a distance of 22 1/2 nautical miles. Angle of visibility over the water, 24°. The light-house is in latitude 42 deg. 50 min. 07.1 sec. N., longitude 124 deg. 32 min. 28.6 sec. West. The magnetic variation, in November, 1870, was 18 deg. 54 min. East, increasing 1 min. yearly.

TELEGRAPH VS. TIME.—When the Russian-American telegraph is completed, says the *London Engineer*, the following feat will be possible: A telegram from Alaska for New York, leaving Sitka, say at 6 40 on Monday morning, would be received at Nicolae, Siberia, at 1 6 Tuesday morning; at St. Petersburg, Russia, at 6 3 Monday evening; at London, at 4 23 Monday afternoon; and at New York at 11 46 Monday forenoon. Thus, allowing 20 minutes for each re-transmission, a message may start on the morning of one day, to be received and transmitted the next day, again received and sent on the afternoon of the day it starts, and finally reaches its destination in the forenoon of the first day, the whole taking place in one hour's time.

A CLOUD BURST IN MONTEREY.—The *Monterey Republican* of Dec. 8th says:

On Friday morning last the unusual phenomenon of a cloud bursting occurred near Mal Paso Creek, on the coast, sixteen miles south of this place. An enormous amount of water dashed to the earth with tremendous force, sweeping everything before it, and pouring an irresistible maddened torrent some ten feet deep through the previously dry canyon of Mal Paso. A substantial bridge was carried away, and timber and cattle destroyed, attesting the sudden floods.

All About the Norway Oats.

The Ramsdell or Norway Oats are attracting a large share of attention at the present time. Although we have had no personal experience in the cultivation of these oats, we have not been unmindful of the large share of attention they have received during the past two years, in every part of the country, and with such an array of facts as is now presented, it would be against both reason and common sense to record anything but a verdict in favor of this extraordinary grain. The testimony, as will be seen by perusing the advertisement alluded to, comes from every part of the Union, from most of the leading agricultural papers, and from individuals scattered all over the country, who have raised and fed these oats. There seems to be a most extraordinary degree of uniformity in all these affirmations, so much so that we feel fully justified in calling the especial attention of our readers to the matter at the present time. The origination and introduction to the world of a new and valuable variety of grain, or of fruit or vegetable or grass, or of whatever else contributes to the sustenance of man or beast is a matter of the highest importance to the world, and should entitle the originator to a higher medal of praise than even the most successful warrior, whose sole thoughts and aims of life are to work destruction to human kind; especially when in so doing so little is thought of betterment to the masses and so much of advancement to the elevated and pampered few. In this connection it may not be without interest that we should give the reader a brief account of the

Origin of the Norway Oats.

That origin, and the remarkable qualities claimed for them, affords another and most interesting illustration of the oft-times importance of *little things*, and the value of careful and minute observation in even the most common transactions and occurrences of life. We condense from the *N. Y. Tribune*:—"In the spring of 1864, Mr. D. W. Ramsdell, one of the most extensive and enterprising farmers of Vermont, had a single oat handed him, which had been found in a package of peas sent from the Agricultural Bureau at Washington. Its remarkably large and plump appearance so attracted the attention of Mr. R. that he planted it in his garden for experiment. Its germination of numerous stalks, their surprising growth and size, their ability to ripen as soon as the common oats, and, above all, their truly wonderful yield of 2,785 grains, being from four to six times that of the old kind, and being far superior in quality and weight, induced him to carefully preserve them for future experiment. After disposing of a portion of these oats to the Agricultural Bureau and to some of his friends, in the spring of 1865 Mr. Ramsdell sowed 2040 grains on land of fair quality, and was again rewarded by the still more wonderful and almost incredible yield of *three bushels and one quart*, while their tremendous growth was the surprise and admiration of all who saw them. By this time the fame of this wonderful oat began to spread; newspapers and those interested in agriculture were turning their attention to it, and letters were received from all parts of the country, many offering almost any price for a small quantity. It was discussed at the meetings of the agricultural societies, and such was the interest manifested that Mr. Ramsdell was invited to visit many of the state and county fairs of the New England and Middle States, to exhibit specimens and relate their remarkable history. And wherever so exhibited, the Norway Oats always received the highest prize, if consistent with the rules of the society; if not, honorable mention and hearty indorsement."

For further particulars about this remarkable grain we refer the reader to our advertising columns, and to a more extended notice in the Farming Edition of the *SCIENTIFIC PRESS*. Those who do not receive the Farming Edition can obtain Circulars by applying by mail or otherwise to this office.

THERE are reports of a new railroad to be built on an air line from New York to Council Bluffs, Iowa, opposite Omaha.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by sending their influence and encouraging favors. We intend to send none but worthy men.

OCCIDENTAL

Insurance Company

OF SAN FRANCISCO.

Cash Capital, \$300,000

GOLD COIN

OFFICE, 435 CALIFORNIA STREET.

Fire and Marine Insurance.

All Losses paid in U. S. Gold Coin.

A. G. STILES, President.

B. ROTHSCHILD, Secretary. 20v17

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New York, have established at 541 Market Street, this city an extensive branch of their business, where they propose to keep constantly on hand the largest and most complete assortment of Billiard Tables, Cloth, Cues, etc., on this coast. The Tables are of the latest styles and size recently adopted in the Eastern States, are manufactured in the best possible manner, and furnished with Phehan's latest improved Cushions. All goods sold will be of the best quality, and the prices fully as low as any other house in the business. The public are invited to visit our warehouses and inspect our stock. 15v23u

G. E. PHELAN.

MILLER & HALEY'S MILLS,

BERRY STREET,

Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.

Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers. 15v21-3m

MILLER & HALEY.

WIESTER & CO.,

No. 17 New Montgomery Street, San Francisco.

PATENTS BOUGHT AND SOLD ON COMMISSION.

Longshores Combination Tool.

town on the Pacific Coast to sell this valuable little implement. Retail price fifty cents.

Simonds Patent Collar Stud.

Every one who wears a "Butterfly" tie, knows well the vexation incident to fastening the loop of these ties over the common collar stud or shirt buttons. This stud while serving every purpose of the common article makes this task as easy as hanging one hat on a nail. The loop slips readily into the slotted bulb, and cannot escape by accident, thus preventing the loss of the tie, now so common. They are well plated with gold. It is very seldom that a patent is offered which affords a larger profit than this one. Parties buying the right to a town, county or state, will be furnished with the studs at what they cost to manufacture. A sample will be sent to any one by mail, on the receipt of the retail price, fifty cents.

Improved Construction of Roof for Tobacco and Fruit Drying Houses.

Persons who are interested in the drying of fruit or tobacco, can fully appreciate this new and useful invention. The object of the invention is to construct the two inclined sides of the roof of a Tobacco or fruit-drying house, so that the sides can be easily and quickly thrown into a vertical position, so as to expose the fruit or tobacco to the drying effects of the sun and air. By the use of this simple device, the labor and expense of handling the tobacco leaves, and changing them upon the racks, is avoided. In California and Oregon, this invention can be used to great advantage in fruit drying. In time of rain the sides of this roof can be almost instantly lowered to protect the fruit from dampness. This invention has been recently patented by M. de K. Cutts, of Richmond, Va., and a full set of drawings, and Letters Patent, can be seen at our office. Here is an opportunity for a profitable investment, as we are authorized to dispose of rights at very low prices. Full particulars can be obtained from any of our traveling agents, or by calling at our office.

NEW HOSE COUPLING.

This coupling is one of the most useful and perfect inventions of the day. It can be joined almost instantaneously and answers equally well for gas or water hose. Call and examine samples. The Right, to any town or city on the coast, will be sold at a reasonable price.

P. Davis' Wire and Picket Fence.

Although about two hundred different styles of fences have been invented and patented in the United States within the past ten years, yet this Fence, for GENERAL FARM USE, stands at the head of the list. This is a Virginia invention, and the actual cost of the Fence complete in that State is less than fifty cents per rod. Three men can put up six hundred yards per day. You men who are idle, why hang about the city talking hard times when you can make from five to eight dollars per day building this Fence? We will make a present of ONE FARM RIGHT in each county on the Pacific coast to farmers who will erect one hundred rods of the fence in good style within thirty days after the privilege is granted. We wish to employ several working men to travel in this State and Oregon. Price of territory, and circular with full description of fence sent on application.

New Gas Light.

This Light takes the place of the Candle, the Kerosene Lamp and Coal Gas. Each Lamp is a perfect Gas Factory, making its own gas as fast as it is required. It is a safe, cheap and beautiful light. Circulars and full particulars sent on application. A few good traveling agents wanted to sell this and other valuable Patents.

Steam Cooker.

This simple and practical Cooker can be attached to any Cooking Stove, and prevents the possibility of scorching or burning food. It facilitates cooking and saves fuel. Don't fail to call and see the model or send for descriptive circular.

AGENTS WANTED

FOR

Zell's New Encyclopedia.

This work, the Best, the Latest, and the Cheapest ever
published. It is not only a

COMPLETE ENCYCLOPEDIA,

Freshly written, and up with the times, but is also
a thorough and complete

Lexicon, a Gazetteer of the World, a
Biographical, Bibliographical, Legal
and Medical Dictionary.

And the only book ever published containing all these
subjects, with 2,000 Engravings. This really wonderful
work is to render readily accessible reliable information
on every conceivable subject. No human being could
be found to whom it would not prove invaluable. It
minutely describes every disease flesh is heir to; ex-
plains every legal term or phrase; gives the geography
of the entire world; acquaints you with all noted men
and women living or dead; describes every country, city
and town; defines every word in use in the English lan-
guage; pictures the birth-place and gives portraits of many
distinguished personages; teaches the correct pronun-
ciation of proper names; is a biographical dictionary of
all nations; a biblical dictionary; describes every ani-
mal known to exist; acquaints you with authors, sculp-
tors, travellers, warriors, painters, divines, historians,
naturalists, etc., of ancient and modern times; speaks of
all the battles and heroes of the late war; and explores
the whole vast vegetable kingdom.

LEA & PERRINS'

Worcestershire Sauce.

Declared by Connoisseurs to be the only good
SAUCE. The success of
this most delicious and
unvalued Condiment
having caused certain
dealers to apply the
name "Worcestershire Sauce" to their
own inferior compounds, the public is
hereby informed that the only way to
secure the genuine is to ask for LEA &
PERRINS' SAUCE, and see that their names
are upon the wrapper, labels, stopper and
bottle.

Some of the foreign markets having
been supplied with a spurious Worcester-
shire Sauce, upon the wrapper and labels
of which the names of Lea and Perrins have been
forged, I and E. give notice that they have furnished
their correspondents with power of attorney to take in-
stant proceedings against manufacturers and vendors of
such, or any other imitations by which their right may
be infringed.

Ask for LEA & PERRINS' Sauce and see name on
wrapper, label, bottle and stopper.

Wholesale and for export by the Proprietors, Worcester-
shire; Cross and Blackwell, London, E.C. &c., and by
Grocers and Oilmen universally. Agents, GROSS
& CO., San Francisco. 1v30-1v

Mechanic Arts College Lectures.

[Reported expressly for the Press.]

Climate of the Coal Period.

LECTURE V., DEC. 10.—Prof. Joseph Le Conte, in this lecture, referred to diagrams giving the land limits of this continent during the coal period. These show that then there was a much smaller extent of dry land than now, as was the case on all the present continents. Whether other continents, now submerged, existed, we have no means of knowing. The maps show us, moreover, that there was not so much elevated land, no mountains so high, as at present. On these peculiarities, the climate was undoubtedly dependent to a great degree.

Compared with that of the present age, the climate of the coal period was characterized by greater warmth, greater moisture, greater uniformity everywhere, and a more highly carbonated atmosphere. Our evidence of these facts are derived chiefly from the plants.

That there was greater warmth is shown by the fact that the plants were almost all of a tropical nature. Thus, ferns constituted about one-half of the flora in Great Britain, while now they constitute about one-thirtieth, and probably the ratio was as large for this country. Of the 1,500 known species of ferns, 1,200 are tropical. All the tree-ferns are tropical, all the arborescent club-mosses, then so abundant and which actually grew to great trees; all cycads and *Aracarie* exist now only in tropical regions.

That there was greater moisture is shown in the same way. The fern is the denizen especially of oceanic islands in tropical regions. Other indications are the great extent of coal swamps and the great succulence of plants of the coal age. The great uniformity of plants found in the coal measures in all parts of the world shows that there was a great uniformity of temperature at all places and at all seasons. Up as far north as 78 degrees of latitude, the tropical climate extended, as evidenced by the coal beds of Melville Island.

That the atmosphere was highly carbonated, charged with carbon, or rather carbonic acid, is proved by the luxuriance of the flora. Carbonic acid is the food of plants; they take it from the atmosphere, extract the carbon, and give back the oxygen. This highly carbonated condition favors more particularly the growth of vascular cryptogams—ferns and club mosses—then so abundant. Boussingault, by experiments, showed that the increase of carbon in the air up to a certain amount actually increased the general growth of plants, and especially that of ferns and club mosses, and this up to 5 per cent.; whereas the atmosphere now contains only about 0.05 per cent. As the whole of the coal was thus taken from the air by the plants, the large deposits of this article prove that the air must have been heavily charged.

Causes of these Climatic Conditions.

The moisture and uniformity are easily explained by the physical geography of the period—the great expanse of water and the absence of high mountains. High mountains serve to condense moisture and dry the air, and cause differences of climate. Their absence has a contrary effect.

In regard to the cause of the greater warmth, there are a number of theories. But such as that of the earth drifting through warm zones of space, or that of the decrease of the sun's heat, we will dismiss as unsupported by good evidence or reasoning. There are, however, two prominent theories which demand our attention—that of the greater internal temperature of the globe, and that of the distribution of land and water.

It is almost certain that the earth was once an incandescent fluid mass, which has gradually been cooling down. But it would seem that the difference between its temperature then and now has been greatly over-estimated. The temperature of the surface now is due almost entirely to external causes, being raised only about one-twentieth of a degree by the internal heat. As we descend into the earth we find a certain increase of warmth—about one degree for every 60 feet. Mr. Hopkins, of England, has shown that the ratio of increase from internal causes (one-twentieth to one or one to 20) would always be the same, whatever the temperature at the surface. If, for instance, internal heat caused the surface to have a temperature of 20 degrees, 60 feet down it would give a temperature of 20 times 20, or 400 degrees. Hence if the warmth of the surface during the coal period were higher, as it undoubtedly was, than now (or as high), and were due merely to internal causes, only a short distance down this heat must have been

enormous; at a depth of a few feet we should have had the boiling point; and it would not have taken long to get down to melted rock. These conditions hardly permit the existence of a flourishing vegetation.

During the coal period the warmth was undoubtedly greater than now, but probably not so very much greater. The process of cooling of the globe has been very slow. A calculation of the time which would now be required to cool down the surface one thirty-fourth of a degree (Fahr.), will give some idea of geological time. According to Poisson, this would take 100,000,000,000 years; and Mr. Hopkins has calculated that it must have required as long a time, supposing this the only mode of cooling, to have diminished the last two or three degrees.

The theory of the distribution of land and water is also hardly satisfactory. If we had all the land about the equator, and all the water toward the poles, we should undoubtedly have a greater general heat than we do. The globe heats at the equator and cools at the poles; the land heats up quicker than water, which is the poorer radiator. But in the coal period there was no such distribution of land, which is known to have existed in the temperate and sub-arctic regions.

A New Theory.

Until recently the lecturer had supported the idea of the warmth being the result of a combination of these two causes—the increased temperature of the globe at that time and the physical geography of the earth. This, although unsatisfactory, was accepted for want of something better. But the recent experiments of Prof. Tyndall, of England, have suggested a new theory. It is necessary here to recall some physical facts.

The common sunlight is composed of three sorts of rays—light rays, addressed to and affecting the eyes; heat rays, addressed to and affecting the general sensibilities; and chemical rays, not affecting us so directly, but producing chemical changes, as shown in photography, for instance. Now these three kinds of rays can be separated from one another by straining them, so to speak, through certain substances. That is, there are certain substances which will transmit one of these kinds, but are perfectly opaque to others. Again, there are substances which will transmit light with perfect ease, and also heat when accompanied by intense light, but will not transmit heat unaccompanied by light. The first we will call *light-heat*, the second *dark-heat*.

We have many familiar instances of this last assertion. Common glass admits the heat and light, the light-heat, of the sun. But a piece of glass held before a common fire stops much of the heat while transmitting the light, for here we have principally dark-heat. We all know how a room exposed to the sun can be kept warm in cold weather by keeping the window shut, or how a glass-house is kept much warmer than is the exterior air. The light-heat of the sun is transmitted through the glass and warms up the interior, but the heat reflected from the substances inside the room or glass-house is unaccompanied by much light, is dark-heat, and therefore cannot escape back through the glass, but is retained, imprisoned, so to speak.

Now the earth is a great conservatory of heat, for the atmosphere prevents the dark-heat reflected from it to escape, while transmitting the light-heat of the sun. Had we no atmosphere, the heat received during the day would be radiated back at night, and we should have an excessive degree of cold after dark.

There is another point to which we must attend. The constituents of the atmosphere are oxygen, nitrogen, carbonic acid and aqueous vapor. But there is a great difference between these as to their opacity to dark-heat. Oxygen and hydrogen are almost perfectly transparent, while carbonic acid and aqueous vapor are very opaque in this respect.

Now for our theory. We have seen that at the coal period there was a large amount of carbonic acid and aqueous vapor in the atmosphere, so large that one can readily believe that this will fully account for the greater warmth at that period, especially if we take the physical geography into account. As the form and extent of the dry land has changed, and the plants have drawn the huge amounts of carbon from the atmosphere and stored it up for man's future use, the moisture and carbonated condition of the air have decreased, and consequently the earth's surface has cooled.

As to the reason why the atmosphere then held so much carbonic acid, we have two possible causes—the original constitution of the atmosphere, and the great

activity of carbonic acid producers. These last are principally animal respiration, combustion and general decay of organic matter, carbonated springs, etc. But as these merely give back what they have previously received, we must recur to the original constitution of the air as the cause.

Recapitulation.

During the coal period the climate was warm, moist and uniform, there was but little circulation of the air and the atmosphere was heavily charged with carbonic acid. These conditions were favorable for plant-growth, but unfavorable for the life of higher animals. Accordingly we find no such animals then existing, but only cold-blooded ones, which have a great endurance of carbonic acid.

But in the process of time the most of this carbonic acid was drawn from the atmosphere by the plants and stored up as carbon in the immense coal deposits. The moisture was decreased by the great "Appalachian Revolution" referred to in the last lecture, which raised the land and drained the swamps. Thus the air was purified and the necessary conditions introduced which enable man now to inhabit the earth.

The Iron Deposits of the Coal Period.

We have previously seen how, in our coal measures, there occur alternations of shales, sandstones, limestones, and clays, with seams of coal and bands of iron ores. These bands occur repeatedly, but in no regular order, and vary from the thickness of a hand to that of 40, 50 or even 60 feet. They generally lie directly upon an impervious bed of under-clay.

We find here two kinds of iron-ore, both really the same condition of iron, the carbonate, but commonly separated, according to their occurrences, as clay-iron stone and black-band, the latter being shale impregnated with carbonaceous matter, and especially valuable for smelting, as the materials for slay, fuel and iron are here all combined. In all other strata the peroxide of iron occurs, but in the coal measures only the carbonate of the protoxide. The following table of the number of tons manufactured yearly in the great iron-producing countries will give an idea of the importance of the deposits.

	1845	1864
Great Britain.....	2,200,000 tons.....	5,000,000
United States.....	500,000 "	1,200,000
France.....	450,000 "	1,217,000
Prussia.....	300,000 "

A wonderful mark of design is shown by the fact that, in Great Britain, nearly the whole of the iron ore is raised from the coal mines.

Accumulation of Iron Ore.

Of all chemical substances, that which has the widest and strongest affinities, is oxygen gas. We may say that the whole surface of the earth is oxidized matter covering, perhaps, unoxidized metals. The great antagonist to oxidation, in nature's laboratory, is life. In the growth of plants carbonic acid is deoxidized to carbon, and in death this carbon or organic matter still exercises the same influence, having a strong affinity to oxygen. Peroxide of iron (Fe_2O_3) and organic matter coming in contact, there is a tendency to a mutual action, the carbon (C) taking some of the oxygen (O) and becoming carbonic acid (CO_2) thereby changing the peroxide to protoxide (FeO) and these two products combining to carbonate of iron (FeO, CO_2). Fe_2O_3 is entirely insoluble in water, but FeO, CO_2 is slightly soluble in all meteoric water.

We have, then, the tendencies of natural forces to peroxidize the iron, the tendencies of the physical forces to distribute this, and the tendencies of the organic forces to deoxidize and carbonate it. These are continually working against one another. Thus, the waters carry Fe_2O_3 in contact with organic matter; FeO, CO_2 is formed and dissolved in meteoric water containing an excess of CO_2 ; chalybeate springs result, in which the iron is again exposed to contact with the air and oxidizing influences, oxidized and deposited, forming often the bog-iron deposits in low swampy places,—unless there is an excess of organic matter when we get carbonate of iron deposits.

We can find plenty of illustrations of this. If we examine the decaying stump of a tree which has grown in red clay, we find that this clay has been or is being bleached, the red color being due to Fe_2O_3 , which is changed to soluble FeO, CO_2 and removed. In some localities red soil is common, but never where forests grow, and never in swamps. Beneath our ordinary peat bogs we often find hard beds of iron ore, which is always FeO, CO_2 . Where we find red sandstones, experience has shown that we need expect no coal and but few fossils; the sandstones of the coal pe-

riod are all bleached to a gray color. We have these conditions:—where there is no organic matter, we find Fe_2O_3 disseminated in red rocks; where we find but little organic matter, we may have FeO ; where we find an excess of organic, we always have FeO, CO_2 .

The only doubtful point is the exact mode in which the accumulation of iron ore took place in the coal measures. Dana's theory is that it was collected as now in peat bogs:—meteoric water leached the rocks and carried the iron into the swamps. Roger's theory is that the Fe_2O_3 distributed in the bed rock strata was deoxidized and dissolved by gases and by water, which last percolated down until it came to an impervious bed of under-clay, on which it deposited the iron.

Iron ore is the mark and measure of previous life, of which we have three signs:—the existence of coal, that of iron ore, and that of fossils.

Conclusion.

We have seen that the tendency of chemical and physical forces is to peroxidize and distribute our iron so that it is not available to men; that of the organic forces is to deoxidize and accumulate it in stores for man's benefit.

Organic matter is so much material taken from the atmosphere and stored up in plants, etc. The rate of this is so great and the quantity to be thus used so small, that it would not be long before all our carbon would be laid away, were it not returned again whence it came. This is done in various ways, by the respiration of animals, which have taken their carbon from the plants, by combustion, decay, etc. Thus we have a constant circulation, often lasting from generation to generation.

But this is not a mere circulation without results. The phenomena of life, of mental and moral activity are some of the results achieved. A portion of the organic matter stops for a while on its cycle and forms our coal beds; another causes the accumulation of iron ore; still another writes its epitaph on the leaves of nature's book, telling its own story in the fossils, where it has compelled mineral matter to take its place, molecule by molecule.

This lecture closed the series on the coal measures. The next two, also by Prof. Joseph Le Conte, will treat of mineral veins.

WHY THE RAIN FELL FOR FIVE DAYS

UPON A GROUP OF GRAVES IN ALABAMA.—Some days ago, says the *Charleston News*, we published an account from Mobile of a mysterious dropping of rain upon certain graves in the cemetery near that city. The mystery is thus solved:

EDITOR "REGISTER":—Having occasion to visit a sick person near the Catholic graveyard, curiosity prompted me to make some inquiry about the phenomenon of rain falling in a certain yard. It is all due to a young leafless wild cherry tree standing in an adjoining yard. This is not uncommon at this season of the year with the wild cherry, crape myrtle and swamp poplar trees. It is caused by the sap ascending, after the leaves have fallen off, in great quantities, from some atmospheric cause.

The little scar left on the branches when the leaf falls off coats over with gum; the sap rises and collects under the coat, and by a "vis a tergo" action bursts the coating, and many of them at a time produce a very fine shower. There are other phenomena of this kind in and about the city. One (a poplar tree in Holly's garden) now, or was about a week ago, giving forth quite as much water as the one in question. A crape myrtle on the old shell road has been showering every fall for many years.

MOBILE, Nov. 3, 1870. H.

As having a curious affinity with the above paragraph, the *Bulletin* reproduces an extract from the Holly Springs (Miss.) Reporter:

A singular phenomenon may be witnessed on the farm of M. C. Pegues, five miles southeast of Holly Springs. A black gum tree, about 30 feet high, growing on the hillside, surrounded by other trees, has been for years a source of wonder to many in this neighborhood, and has gained for itself the name of "Raining Tree." On Saturday last several persons visited this remarkable tree.

The day was perfectly calm, warm and cloudless, with the exception of a few clouds in the south. Immediately under, and a short distance beyond the branches of the tree, a gentle rain was falling continuously, saturating the ground beneath, and nowhere else was a particle of moisture visible. The water collected in fallen leaves had the appearance and taste of rain water.

PORTLAND, OREGON, Nov. 24th, 1870.—Dewey & Co.,—Gentlemen,—It is a Thanksgiving to day, and I think it is my duty to write you a letter of thankfulness, for the trustworthy and business like manner in which you have attended to my business. Four inventions illustrated by valuable models, which I place in your hands, together requiring years of hard study, have been protected by valuable patents through your agency. Dewey & Co., are the only Patent Agents that I shall ever employ to obtain Letters Patent for me so long as I live, and I thank you sincerely for your honorable duties to me. I shall soon place four more cases in your hands for prosecution. Again thanking you, I remain, Yours &c., THOMAS HILL.

SUCCESS IN BUSINESS.—SUCCESS IN THE BUSINESS world usually depend upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 24, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book Keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 23v22-3ms

SOZODONT.—All denturists had their drawbacks, until the salubrious Bark of the Soap Tree was brought from the Chilian valleys, to perfect the fragrant Sozod. NT, the most wholesome, reliable and delightful article for the Teeth that a brush was ever dipped into.

"SPALDING'S GLUE," always up to the sticking point.

PHOTOGRAPHY.—FOR CABINET PHOTOGRAPHS, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. Ovis 6m B. F. HAWLAND.

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brauman street. 44v19-3m

THOMAS O'NEIL Ornamental Glass Cutter, No. 10 Ste venson street, up stairs. Stained, Ground and Ornamental Cut Glass to order on reasonable terms. 14v20

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your journal is very valuable. No better investment for \$4. Respt. B. C. B.

CONTINENTAL Life Insurance Co., 302 Montgomery street, corner of Pine.

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which surpasses every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the Maravilla Cocoa above all others. For homeopaths and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homeopathic Cocoa and Saluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

THE PRESS is just such a journal as the people of this valley should patronize—it ought to go to every residence. It is devoted to the agricultural and mining interests, mechanic arts and general industrial progress. The subscription price is \$4, which, considering that the Press is one of the largest and ablest journals of its class in the Union, we consider very reasonable.—Every business man of Bozeman, will we are satisfied, give Mr. Murray his name, and we hope such of our country friends as he interviews will be equally liberal. PICK & FLOW, MONTANA.

TO MINERS, MILLMEN AND METALLURGISTS. Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

SCIENTIFIC PRESS—three numbers—terms \$4 per annum—San Francisco. Constant improvements are being made in this publication. Illustrated mechanics receive liberal attention. Of late, an edition exclusively devoted to agricultural matters is issued simultaneously with that devoted to mining and scientific affairs generally. The growth of the paper and multiplicity of subjects embraced in the table of contents give evidence of an increased patronage and a corresponding industry to maintain its high character.—Colorado Herald.

Miners, Look to Your Interests!

SAVE EXPENSE.

Use the most economical working machinery for crushing your ores.

The Wilson Patent
STEAM STAMP MILL

IS AN

IMMENSE SUCCESS.

NO MINER STUDYING HIS INTERESTS WILL USE ANY OTHER MILL.

It costs a great deal less than any other mill and does its work for from twenty-five to fifty per cent. less expense.

The Wilson Steam Stamp Mill
CRUSHES ONE TON PER HOUR

OF THE

HARDEST QUALITY,

THROUGH THE ORDINARY SCREENS.

One of these mills now being used as custom mill,

AVERAGED,

On Rock from Twenty-two Mines,

Twenty-eight Tons Per Day.

It uses about three cords of wood for twenty-four hours.

Is all complete when it leaves the shop, and weighs about 6,500 pounds, and can be put in operation in one week after it reaches the mines.

THE COST

of this mill all complete, including boiler, pump, setting and everything in complete running order at the mine is

NOT OVER ONE HALF

THE EQUIVALENT

OF ANY OTHER MILL.

These mills have now been in practical operation for nearly three years, and have proved in point of

Durability, Economy and Efficiency,

TO HAVE

NO EQUAL.

It requires no skill to run them and any one of ordinary abilities can set them up. The success of these mills having been so unprecedented that we now

GUARANTEE THEM

to be all that we claim for them and guarantee all repairs for twelve months.

Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a
QUARTO-MEDIUM SIXTEEN PAGE PAPER
AND IS A FIRST CLASS
Literary and Family Newspaper,
AS WELL AS THE
Organ of the Masonic Fraternity on the Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.
The following resolution was unanimously adopted by the M. W. Grand Lodge, F. & A. M., of the State of California, at its Annual Communication, October, 1870. Whereas, in the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,
Resolved, That this Grand Lodge, recognizing in the Masonic Mirror, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said Masonic Mirror to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.
At the communication of the M. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the MASONIC MIRROR, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.
The Mirror presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

ROOT'S PATENT FORCE BLAST ROTARY BLOWER.

MANUFACTURED BY KEEP & BARGION,

At the Globe Iron Works, Stockton, California.

Awarded the First Premium at the Paris Exposition.

Patented Nov. 1st, 1864; July 21, 1866; and Oct. 9, 1866.

ADAPTED FOR Smelting, Foundry, Mining and Steamships.

REQUIRES Fifty Per Cent. LESS POWER Than any Blower Now in use.

One of these Blowers may be seen on exhibition at W. T. Farratt's Brass Foundry, corner of Mission and Fremont street. They are also in use at the Almaden Quicksilver Mine; Gridley's Foundry, Gold Hill, Nevada; Zema Iron Works, San Francisco, and many other places.

CAUTION.—Purchasers will find it to their advantage to apply direct to the Stockton Agency, as certain parties, not authorized to manufacture the Blower, have put in the market machines of inferior construction, which do not answer all the requirement of the genuine article.

Quartz, Saw and Grist Mill Irons, Steam Engines, Horse Powers, High and Low Pressure Steam Engines, Steamboats and Propellers, made at short notice.

NOVELTY MILL AND GRAIN SEPEARATOR.

THE undersigned having purchased of the Patentees, WILTS & SWIFT, of Hudson, Michigan, their right to this mill, Patented June 22d, 1869, for California, Oregon, Washington Territory, Montana, Utah, New Mexico and Arizona, wishes to call the attention of FARMERS, MILLERS AND GRAIN DEALERS to one of THE GREATEST IMPROVEMENTS OF THE AGE for cleaning and separating grain. While it combines all the essential qualities of a first-class FANNING MILL, it also far exceeds anything that has ever been invented for the separation of grain. It has been thoroughly tested on all the different kinds of mixed grain, separating all the different seeds in almost a magical manner, placing them in their different compartments in the mill arranged for their reception, at the same time taking out all the Mustard, Grass Seed, Barley and Oats, and making two distinct qualities of wheat if desired, thereby selecting superior, large plump and perfect kernels for SEED WHEAT, and all the small and cut kernels, such as merchantable wheat, is deposited in another compartment. By the use of this fan, as the cut or shrunken kernels will never germinate. The above mentioned Novelty Mill is the only mill known to possess all these superior qualifications, and was exhibited and tested at the last Michigan State Fair held at Jackson, Michigan, September 21, 22, and 23, 1869, and bore away the palm over some thirty other different mills from all parts of the United States, including the famous Dickey Mill of Racine, Wisconsin. All who have witnessed here the operations of the NOVELTY MILL, declare it perfection, and the most beneficial invention to the Farmers, Millers, and Grain Dealers ever introduced on the Pacific Coast. The Farmers in Santa Clara County, are loud in its praise, and also in other parts of the State where it is being introduced. No. 1 Mill, complete, is capable of cleaning 25 tons of grain per day; No. 2 Mill, 15 tons; No. 3 Mill, 8 tons. A large number of recommendations and certificates of the practical working of the mill will be furnished. Circulars containing references sent free by mail. N. B. Town, County, or State Rights for sale on favorable terms. For further particulars apply to

R. STONE, 422 Battery Street, San Francisco.

GEO. T. PRACY'S

MACHINE WORKS,

109 and 111 MISSION STREET, SAN FRANCISCO.

MANUFACTURER OF

PRACY'S IMPROVED

PATENT STEAM ENGINE

GOVERNOR.

These Governors are the most sensitive built, running at a high velocity and maintaining a uniform speed.

SOLE AGENT FOR

L. W. POND'S CELEBRATED TCO S,

— SUCH AS —

Lathes, Planers, Drills, Boring Mills, Milling Machines, Etc.,

Which I will offer at very low rates. Also,

MORSE'S TWIST DRILLS, AND CHUCKS OF ALL KINDS.

MANUFACTURER OF

Steam Engines, and Mill Work Generally.

Sole Agent for TAFT'S PATENT SHEARS AND PUNCHES. 3-21

MACHINERY

— AT —

GREATLY REDUCED RATES.

Miners' Foundry & Machine Works,

235 TO 241 FIRST STREET, SAN FRANCISCO.

This Establishment is now working upon the CO-OPERATIVE PLAN, And are thereby enabled to manufacture MACHINERY, CASTINGS & BOILERS AT EASTERN PRICES, And better adapted to the wants of the Pacific States. Ascertain our prices before purchasing. 8-20q

CALIFORNIA BRASS FOUNDRY,

No. 125 First street, opposite Minna, SAN FRANCISCO.

ALL KINDS OF BRASS, Composition, Zinc, and Babbit Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Bolts, Solder Braces, Hinges, Ship and Steamboat Bells, and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. 8-21 PRICES MODERATE. J. H. WEED, V. KINGWELL.

California File Manuf'g Co.

437 BRANNAN STREET, bet. Third and Fourth. W. WUSTHOFF, L. KRAMER.

REAPER AND MOWER SECTIONS, BARS AND KNIVES COMPLETE.

At a saving of 50 per cent. New Files of every description on hand and made to order. Old Files re-cut, and warranted equal to new. Orders from the country promptly attended to. 9-19-47

McAFEE, SPIERS & CO.,

BOILER MAKERS

AND GENERAL MACHINISTS,

Howard st, between Fremont and Beale, San Francisco.

Flue or Tubular Boilers, with plain circular or spiral courses. Upright Flue or Tubular Boilers, Locomotive and Marine Boilers, and Wrought Iron Tanks of every description.

Hydraulic Pipe supplied at reasonable rates. In ordering, give the quantity of water to be supplied, height of the fall, and total length of pipe, so as to enable the firm to determine the diameter of the pipe and thickness of iron to be used.

Repairs.—Boilers, Smoke Stacks, Pipes, etc., put in repair with promptness.

To Boiler Makers and Machinists in the Interior.—The firm is prepared to furnish estimates of Boilers, supply new Heads, drilled and punched, and attend to the selection and forwarding of Iron for Boilers, Pipes and other purposes.

Plans, Drawings and Specifications.—The firm is prepared to make out Plans and Specifications, receive estimates, and superintend the Erection of any Machinery that may be entrusted to their care.

To Inventors.—The firm is prepared to assist in developing the plans of those who have the ideas but not the practical experience necessary to put the same in form, by making drawings of their inventions, giving them the benefit of their practical knowledge in the construction of Machinery, and attending to the manufacture and introduction of their inventions. 11-18

THE WILSON Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL,
For Durability, Efficiency,
AND ECONOMY OF WORKING,
HAS NO EQUAL.

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.

Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.

F. R. WILSON,
20919-1f Supt. W. P. S. S. M. Co., Philadelphia.

THE ASPHALTUM PRESSURE PIPE COMPANY,

HAVING ERECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities.

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; it is lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any hole can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 615 Mark-t street.

27 Circulars sent on application.

HAVLAND, HOOPER & CO., Agents, No. 335 Pine St.

27 Best means yet discovered for saving fine particles of Gold.

20v21-1f

STEVENSON'S PATENT MOULD BOARD AMALGAMATING PAN.

This Pan is far superior to all others in several important particulars. The grinding rollers are near the center, requiring less power. The plow-shaped grooves raise the quicksilver with the pulp regularly, with less power, without violence, and with better amalgamating effect, besides admitting of a larger charge. The inclined-shaped housings of the miller plate openings efficiently force the pulp directly under the millers.

It has been constantly running for over eight months, and has proved, in competition, to produce a higher percentage of bullion, with less power and with great saving of quicksilver over any other pan in use. It is simple in construction and operation, and cheaper in first cost and economy in wear.

HOADLEY'S PORTABLE ENGINES!

3 to 20 Horse Power on Carriages and Beds.

These Engines are in use all over the United States, and are regarded as the best in use. They are self-contained Engines, without the running gear and appurtenances, for driving

Saw Mills, Grist Mills, Tanneries, Machine Shops, Planing Mills, Factories &c.,

and for all other purposes under seventy-five horse-power, to which Stationary Engines are applied. For Agricultural uses they are unsurpassed. For Circulars or pamphlets, describing dimensions and price address

STEAM JET PUMP.

Blakeslee & Williams' Patent, for
Water, Oils, Acids, Etc.

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit.—It is operated by steam taken directly from the Boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Satisfaction guaranteed or the money refunded. Send for Circular. PARKER & HUNT, Southeast cor. Tenth & K Streets, Sacramento City Cal.

AGENTS—CHAS. F. BROCK, 117 California St., San Francisco; KEEL & BARGON, Stockton. 21v21-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidity pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits. They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows.

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces.—Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Millmen are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

JOS. THORNHILL,

BRICKLAYER AND CONTRACTOR.

Particular attention paid to all kinds of Fire Work, such as Boilers, Furnaces, Ovens, Grates, Ranges, &c. Orders left with C. W. WILKE, 47 Clay Street. JOS. THORNHILL, 1612 Mason St., near Green, will be promptly attended to.

[ADVERTISEMENT.]

Interesting Fact for Farmers About Ramsdell's Norway Oats.

The New York Tribune, after giving a concise history of the these oats says: "Believing that we could not confer upon the agricultural community a greater favor than by ascertaining the production of this grain, we requested Ramsdell & Co., to furnish us with the original letters from the farmers in different parts of the country, who have grown them during the past year; a request which was cheerfully complied with: After some weeks of careful examination of this voluminous correspondence, we have satisfied ourselves of the genuineness of these letters. They are from farmers residing in every part of the United States.

By adding up the results in many hundred cases where the rate per acre was distinctly stated, we have found the average to be *seventy eight bushels* to the acre. The average yield of the ordinary oat, during the past five years, as estimated by the Commissioner of Agriculture, is from thirty to thirty-two bushels per acre. An examination of the correspondence from which this table is prepared, goes to show that the straw of this variety is more nutritious than common oat straw, and we recommend it as a valuable addition to what we now have for early feed in green soiling cattle.

Beware of Spurious Seed.

Nearly or quite all the unfavorable reports which have come to the ear of the public with regard to these oats, have been due directly to spurious seed; the high price that the Norway oat bears, operating as an inducement to swindlers. Buy no seed unless genuine. See below from whom and how to get it in this city.

PRICES.

By mail, postage paid, 2 lb. packages, 75 cts.; 5 lbs., \$1.75. By express (not prepaid), 16 lbs., \$4; 32 lbs., \$7.50. In large quantities at still greater reduction.

CLUBS.—We advise parties desiring to buy small quantities only, to unite with their neighbors in a joint order, making the cost less for cash.

OUR AGENTS will receive orders for these oats on the above terms.

CLUBBING WITH THE PRESS.—Until Feb. 1st, for a club of ten or more, cash in advance, subscribers for the PRESS, at \$3 each per annum, we will furnish the getter up of the club (for his own use or distribution) one lb. of Ramsdell Norway Oats for each name; or 1 lb. for each name and \$4 for a less number than ten subscribers; and if the club is afterwards increased to ten, we will credit the amount paid over \$3 each on receiving subsequent remittances.

For these Oats, in large or small quantity, send direct to the Pacific Rural Press office, 414 Clay St., San Francisco, DEWEY & CO., Agents.

Bucket-and-Plunger Steam Pump.

On account of the care necessary in using direct-acting steam pumps, many attempts have been made to produce a fly-wheel pump which should be capable of being manufactured as cheaply as the common ones. One of the latest attempts, which is claimed as a success, is hereby illustrated, and with it we give the description furnished us.

The inventor, Mr. William Wright, has had a very considerable experience in the matter of pumping engines, and has made certain improvements which have been introduced into the Hartford, St. Louis, and Brooklyn engines. In the machine illustrated, he has produced a vertical steam pump composed of the parts of a simple slide-valve and eccentric steam engine attached in a novel and compact manner to a bucket-and-plunger pump, which discharges water at both strokes of the piston.

The cylinder of the pump is directly beneath the steam cylinder. The piston-rod is connected, in the manner shown, with the trunk of the pump-piston, at whose lower end is pivoted the pitman connecting with the crank-shaft, this latter operating by a suitable device the slide-valve of the steam chest. The outlet-valve communicates with a chamber above, and this connects with the air-chamber at one end, and, at the other, with that part of the pump cylinder above the piston. The outlet pipe is at the bottom of the air-chamber. These parts are so arranged that the pump operates as follows:

The several channels or passages being full of water, and the plunger or pump piston being at its upward stroke, the water entering through the induction-valve will of course have filled the pump-cylinder below the plunger, while water that had previously entered the pump cylinder above the piston from the chamber over the outlet-valve, will be forced back into the same; this being only equal in quantity to one-half of that drawn in through the induction-valve during the upward stroke of the pump-piston, owing to the reduced area of the upper annular face of the plunger as compared to the lower face of the latter. This water from above the pump-piston, passing through the intermediate chamber, to the air-chamber, escapes therefrom to and through the outlet-pipe at the bottom. On the return or down stroke of the plunger, the water under the same in the pump-cylinder is forced—the inlet-valve closing—up through the outlet-valve into the chamber above, from which one-half of the water thus drawn in by the up-stroke passes into the pump-cylinder above the piston, while the other half is forced into and through the air-chamber to the outlet-pipe. It will thus be seen that the pump, although drawing in water only during its upward stroke, discharges it during both the up

and down stroke, one-half the entire quantity being expelled at each.

The pump is manufactured with special reference to simplicity and ease of repair. The water-valves, which are of either metal or rubber, are placed, in such position that access can be had to them by the simple removal of bolts, and without disturbing any of the pipes; the bearing surfaces subject to wear are either lined with Babbitt metal or fitted up with adjustable boxes, so that the wear can be taken up easily, or the bearings replaced at very little expense. These pumps are made by special machinery, and with uniformity of workmanship, which allows of any part being quickly and cheaply replaced when worn out or

THE SAN JOSE BEET SUGAR PROJECT.—The committee appointed at a meeting of the citizens of San Jose to investigate the Alvarado Beet Sugar Enterprise have made their report, upon the strength of which a company has been duly organized for the purpose of establishing a Beet Sugar factory in that city. The capital stock has been fixed at \$200,000, divided into 2,000 shares of \$100 each. W. C. Wilson, Tyler Beach, L. Archer, J. Q. A. Ballou and C. H. R. Page have been appointed a Board of Trustees to manage the concerns of the company for the first three months. The books of the company will be at once opened for subscription to the capital stock. It is to be hoped that the enterprise will not be sl-

WRIGHT'S PATENT BUCKET-AND-PLUNGER STEAM PUMP.

broken by accident. They are manufactured solely by the Valley Machine Company, East Hampton, Mass. They are made of all sizes, from the smallest boiler-feeder to large pumping apparatus for supplying towns with water, and for use in mining and similar operations.

COAL MINE ON FIRE.—By a telegram from Medicine Bow, Wyoming, dated Dec-20th, it appears that the Wyoming Coal company's mine, at Carbon Station, has been on fire for about two weeks, and became untenable on the 18th inst, when a number of explosions occurred, doing considerable damage. The fire was still raging and "there is no possibility of extinguishing it, since the whole town was supplied with water which came from the shaft."

lowed to flag; but will be carried forward to an early accomplishment for San Jose, what the Alvarado enterprise has done for that locality.

We may state in this connection that we shall give, in our next issue, some important particulars with regard to a new and improved process for extracting the saccharine matter from beets, which has recently been most successfully introduced into a large number of beet root sugareries in Germany, and by which both the cost of machinery and expense of manufacturing has been greatly reduced.

COAL SPECULATION.—It would appear that certain parties in this city have obtained control of every pound of coal here, and the consequent rise in price is very hard on the poorer classes.

U. S. Land Commissioner.

The reports continually multiply that Commissioner Wilson of the Land Office is to be removed from his position. It may be that these rumors are set afloat by designing persons without any real authority; but removal from office to make room for some politically inclined individual is so possible now-a-days, and this particular removal would be so injurious to the interests of a very large part of the population of our western coast, that we cannot refrain from another expression on our feelings of the subject.

Commissioner Wilson has filled his position in a most acceptable manner. There are but few government officers, as far as our knowledge goes, who have shown on all occasions so obliging a spirit and so full an acquaintance with the subject in question. Wherever there has been any uncertainty on any particular point in land matters, it has only been necessary to address an enquiry to the Commissioner, who has always proved himself ready and capable of giving a full, direct and satisfactory answer.

Commissioner Wilson has grown old in his position. He has worked up from the lower grades and has become acquainted with all the details of the office. We believe that consequently there can be but few who know an equal amount concerning land matters; and these land matters are now especially of the highest importance. They are being gradually shaped into form, and the substitution of another Commissioner will be very apt to introduce confusion and disorder.

We have never seen Mr. Wilson and know him only by his acts. But we believe that a better man can not be found for his position, and that it will be exceedingly difficult to discover one as good. As reward for honest and long-continued discharge of one's duty seems to be an unsupposable thing in government dealings, we say nothing now, although thinking considerable. But we protest against directly injuring the interests of the people for the pleasure of politicians; and removing the present Commissioner cannot be otherwise than an injury to our community.

NEVADA METALLURGICAL WORKS.—Messrs. Riotte and Luckhardt, both well known to many of our readers as gentlemen of the greatest experience and ability, have started an establishment, in this city, for assaying and treating ores. They are prepared for making working tests by any process, and guarantee returns. We can recommend them to the attention of our mining readers.

A BOSTON NOTION.—We see noticed a device by which a pair of runaway horses may, by a simple movement of the driver's foot, be instantly released from the carriage and permitted to go their way; leaving the occupants quietly sitting in safety, and serenely contemplating the fleeing crowd in front.

Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas they advance.

Notes of Travel in Colusa County.

[WRITTEN FOR THE PRESS.]

Colusa county is bounded by Tehama, on the north, Butte and Sutter on the east, Yolo on the south, and Lake and Mendocino on the west. It is about 60 miles in length by 45 in breadth. The western part, constituting about one-third of the county, being covered by the Coast Range, is hilly or mountainous; the balance is nearly all level, and will show as good average crops, (where cultivated) as any county in the state. The principal difficulty in this county is that ten or twelve capitalists own nearly the whole of it, and with but one or two exceptions (which I will mention further along in my letter) are buying more land, and refusing to sell except at exorbitant figures,—which policy, if persisted in, will depopulate the county. Colusa contains at present less than 10,000 inhabitants; while it has room for and will support well, a population of 50,000, allowing to each 160 acres of the now unoccupied (or at least uncultivated) lands.

Jacinto.

Jacinto is a small village situated on the west bank of the Sacramento river, some 15 miles nearly south of Chico (in Butte county), and 28 miles north of the county seat, Colusa. H. J. Glenn, Esq., owns, at and around this village, the largest tract of land, possessed by any one individual in this county. He holds in round numbers, 37,000 acres, 80 per cent. of which is good arable land, and is still purchasing. He re-lets to the Gupton Bros., and three other parties, a portion of this immense tract; and this last year they put in 1,000 acres of barley, which yielded 30,000 bushels, and 6,000 acres of wheat, which produced 138,000 bushels. Mr. G. employs himself about 20 men, and some 40 more are employed by his renters. He also has the farm stocked with 1,500 head of steers and oxen, 2,000 head of loose cattle and 125 head of horses and mules. This entire tract is enclosed, requiring over 100 miles of fencing. Next adjoining on the south, are the possessions of Mr. A. Montgomery. Very unlike his neighbor on the north, Mr. G., who buys all the land he can get, Mr. M. sells it. This latter named gentleman had at one time about 26,000 acres, but has sold to permanent settlers, until now his possessions amount to only about 9,000 acres, the southern boundary of which begins about 3½ miles north of Princeton and runs 4¼ miles north of that point. As an evidence of the prosperity and rise of real estate in this county, Mr. M. offered 10,000 acres of the above named tract in 1866 for the sum of \$5,000, or about 50 cents per acre, without a purchaser; for this he this year received \$6 per acre, and the land is now held at \$10. He will have this year some 3,000 acres in grain on the shares, for he farms none himself personally. Some pay him a portion of the crop; others a money rental; and to a number who were wholly without funds the seed and farming tools have been furnished. It is said of Mr. M. that he has done more to benefit the renters and small purchasers, than any other land owner in this county; none have been turned away who had a willing hand for work. The lands which he has sold have been delivered to the purchasers under similar conditions to suit their circumstances. Between himself, his tenants, and purchasers, this year 20 miles of board fence will be erected, which will cost an average of \$700 per mile.

Princeton and Vicinity.

Princeton, a thriving little village of about 150 inhabitants, is also situated on the west bank of the Sacramento river, 14 miles north of Colusa and at or near the center of what is known as the Larkin Children's Grant, containing 10 leagues of land granted them by the Mexican government. All of this has been sold to other parties, except 6,000 acres which is owned by Mr. Frank R. Larkin, who is showing a great public spirit here, and to whom this place owes at least one half its present improvements, consisting of a splendid grist mill, brick store, fine hotel and steamboat landing.

Boggs' ranch, about two miles south of Princeton, is the home ranch of Mr. John Boggs, and consists of about 6,000 acres of excellent land. Mr. B. is largely interested throughout this county, and, in fact, throughout the state. He has upon this home ranch

the finest brick farm house in the state, which cost some \$20,000 to erect. His out-buildings equal or excel any others in the county. He has about 4,000 acres under fence, and raised some 15,000 bushels of grain this year. The farm is stocked with 5,000 head of cattle, 1,000 head of hogs, and 200 head of horses; of the latter, some are the fastest upon our California turf. He has refused for his horse "Jerome", 5 years old, \$8,000. He is also the owner of "Latham", 5 years old, and the stallion "Black Bird," who beat all competitors at the last State Fair, is 7 years old, and is valued at \$10,000. Several others of less note are worthy of mention, but the usual apology will suffice, (i. e.) space and time.

Calden's Ranch, consisting of 2,400 acres of land, 1,000 of which is under fence, is owned by A. Calden Esq., and is situated 5 miles south of Princeton. Mr. C. had 400 acres in grain this year. It is stocked with some 700 head of hogs, and 60 head of good horses, among which is the stallion "Flying Morrill," valued at \$7,000.

Colusa.

Colusa, the county seat of this county, is situated on the Sacramento River, some 35 miles north of Knight's Landing, and 27 miles west of Marysville, and ranks among the prosperous agricultural camps of the state. Waterworks were erected here in May last by J. B. Cooke & Co., who have laid 6,700 feet of asphaltum and cloth pipe for mains (two, four, and six inches in diameter), and about 6,000 feet of iron sewer pipes, supplying 150 taps. The supply tank is 18 x 36 feet, and 7 feet deep, elevated 57 feet; the water is drawn from the Sacramento River by a Wilcox steam and water lifter of a capacity of 20,000 gallons per hour. Ten two-story brick business houses have been erected here during the past year, one of which, built by the Bank of Colusa County, cost \$20,000. This bank was organized and commenced business Sept. 15th, 1870. Its capital stock is \$200,000. A majority of the stock is held in the county, the balance by capitalists and bankers throughout the state. The bank is in good repute with the citizens, who feel very proud of its success. W. F. Goad is President and W. P. Harrington, Jr., is cashier.

The high rent of both business and dwelling houses is a matter of complaint here, and not a building is vacant. A large and commodious two-story brick school-house is now in course of erection, which will cost over \$10,000; also in course of erection is a new brick City Hall and Police Station. Jones & Gage own a fine flouring mill here, with one run of four-foot burrs for wheat, turning out 65 barrels of flour per day; also one run of burrs for corn, with about the same capacity.

Col. Geo. Hagar is considered one of the land men of this county, and still retains a portion of the "Jimeno Grant," which contains eleven leagues, commencing in the vicinity of Knight's Landing, in Yolo County, and running to some 7 miles north of Colusa; one company expects to spend some \$200,000 for reclamation purposes this winter on a portion of this same grant (which I will illustrate in my next). The town of Colusa is situated upon this grant, and, like many other towns in the state, has its conflicts about titles. Its site is also covered by the Colus Grant, owned by Col. C. D. Sample; and the legal war between these two Colonels is equal to the ancient war of the Roses. Judge S. C. Hastings, of San Francisco, owns about 2,300 acres of this Jimeno Grant, which is considered among the best in the county.

Ranches of the Plains.

McCune & Garnett own 5,600 acres of fine land which they re-let to Jacob Roderick & Bro. (2,600 acres), and to Wm. Ash (3,000). This tract is situated 10 miles south-west of Colusa. These latter named gentlemen are farming the same very extensively, using every implement that assists the farmer, from a gang-plow to a Hoadley engine. They employ from 12 to 25 men each regularly.

W. H. Williams owns 5,000 acres next adjoining as a stock ranch, 2,500 acres of which is under fence, and is stocked with 5,000 head of sheep and 100 head of cattle.

H. B. Turman Esq. is running the Pulsifer farm, situated 15 miles west of Colusa. It contains 2,200 acres, 1,200 fenced, 500 of which were in grain the present season.

Bear Valley—Sulphur Springs.

Bear Valley is a fine tract of land situated about 33 miles west of Colusa, in the high hills or mountains of this county. It is about 10 or 11 miles long, and from 1¼ to 3 miles wide.

Some 25 farmers and stock-raisers own and cultivate the same. The mail facilities are very meagre for this section. Colusa, 30 or 35 miles away, is the nearest post office; but I was informed that the government has consented to the establishment of a post office here, and another at the Oak Park ranch. At present each family in this section has to pay private parties from \$6 to \$12 per year for the delivery of their mail matter from Colusa once a week. The feeling now in this section is, if the government advertises for bids to carry the mails here, that bids will be put in as low as \$600 per annum for a weekly mail, or \$1,200 for one three times a week.

Sulphur Springs, 35 miles west of Colusa, has become an extensive place of resort for invalids. Two good hotels, situated one mile apart, and owned by D. P. Coon and W. Clark, are doing a good business. The hotel and bathing houses formerly owned by Wilber, were destroyed by fire some time since. The sulphur works, together with the prospecting for cinnabar in this vicinity will receive attention from me in a future article. The amount that has been sunk in prospecting for oil here I will agree to say nothing about. Knight's Landing and vicinity in my next.

L. P. Mc.

All About Montana.

[WRITTEN FOR THE PRESS.]

You may consider this letter, if you please, a postscript to my others from Montana. On reviewing what I have written, I see that one subject of the greatest importance to the territory has been passed by without sufficient notice; and although I have nothing particularly novel to say, yet my letters would be incomplete without special reference to the Northern Pacific Railroad.

This road, from Lake Superior to Puget Sound, must pass through the rich regions of Montana, whatever special route may be selected. The old plan was to run it more to the north, taking advantage of the lowest passes of the ranges below the British boundary line. One projected line crossed the Yellowstone at Coal creek, followed this river some distance, crossed the Musselshell River, thence down Deep Creek to the Missouri, crossed the Rocky Mountains at Lewis & Clarke's or Cadotte's Pass, proceeded down the Big Blackfoot to the Hell Gate, and thence ran down the Clarke's Fork of the Columbia, where it passes out of the territory. Another line was run down the Yellowstone to the Big Bend, over Bozeman Pass to the Three Forks of the Missouri, up the Jefferson to Wisdom River, through Deer Lodge Pass, down the Deer Lodge and Hell Gate Rivers to the mouth of the Big Blackfoot. The latest and, as it now seems, most probable route is that of the Snake River.

The distance from Puget Sound to Chicago is claimed to be some 550 miles less than that from San Francisco to Chicago. The engineering difficulties are said to be less and the country much better. Timber is abundant for fuel and construction along the line, there is water everywhere, coal of good quality is found, and the agricultural lands thus opened are extensive and excellent. There are, moreover, large mineral districts to be developed. Such a road would soon enable Montana to supply Chicago with the most excellent meats; at least, so think the ranchers of this splendid stock-raising country.

There is naturally considerable feeling between the inhabitants of the northern and the southern parts of the territory with regard to which is the best route for the railroad. I am free to confess that my engineering qualifications, as well as my knowledge of the difficulties and advantages connected with either line, are insufficient for me to give a judgment on the subject. But I do know that it is a matter of great importance to all parts of the territory to have the road built and equipped as soon as possible. It might, perhaps, on the whole, reasoning on general principles, be best to have the northern route selected, because otherwise the upper portions of Montana would be left at an unfair distance from any grand trunk line; and the southern portion could in any case form an easier connection with such lines, and would, in this case, be able to connect with both routes. But I do not care to participate to any extent in the discussion going on between the various districts. I imagine, moreover, that the company will act rather independently in selecting its route.

People say that this Northern Pacific Road

will deflect from the middle route the principal part of the Asiatic trade. The ocean currents are such that vessels from Asia, destined even for San Francisco, are compelled to make nothing up as far as Puget Sound. This is an important item for the company. But without this, I believe the capabilities of the country to be traversed are such that the line will soon pay fairly, if properly managed. Montana alone will bring to its aid immense resources. Settlers will flock to its rich agricultural lands; stock-raisers will have an immense market brought to their very doors; the miner will be able to obtain his supplies and forward his bulion at much cheaper rates. While diminishing the present prices, it will increase out of proportion the sales. Immigrants will go where a railroad runs, but will hesitate to venture long distances from the track of the iron horse. Capital will pour into the country as soon as travelers can know by personal experience of its true resources, and from north and south, from east and west, from mountain and plain, will come the busy hum of industry.

Thinking, as I do, that the speedy development of Montana depends to a very great extent on the early building of this road, I could not close my series of letters from the territory without saying a few words on the subject, even if these words should be considered commonplace repetitions.

W. H. M.

Submarine Torpedoes.

There is no subject of more immediate interest to engineers than the construction and use of submarine torpedoes. This is especially appreciated in England, where submarine engineering forms a distinct branch of instruction in the military service. The utility of devices of the class indicated is more likely to be proved, in the event of war, in the defense of harbors, and in such will not be confined to fixed torpedoes (as was the case at Charleston during the late war, and also at Sebastopol some years previous), but will include the employment of those capable of travel and guidance under water. It is evident that such an appliance striking an armored vessel below the plating would sink her as readily as an old wooden line of battle-ship would sink if struck between wind and water by a ten-inch shot.

At the first meeting of the third session of the New York Society of Practical Engineering, this variety of projectile was very carefully considered in a valuable paper by Mr. Robert Weir, late of the United States Navy, who described the construction of a new submarine rocket invented by himself, and tested in a series of practical experiments which were claimed to fully demonstrate the success and utility of the system.

His plan is to construct the torpedoes of thin, strong metal, making them in two parts,—the exploding shell and the propelling shaft or chamber. The shape of the shell is very much like a paraboloid conoid, rather long. This is filled with nitro-glycerine or gun powder, and a percussion cap is screwed upon the apex of the shell, forming a surface which will explode it when touching at almost any angle. The shaft or rear part is made tapering from the larger diameter of the shell to the rear, where there is a contracted opening. It is supplied with three keels or wings, at equal distances apart and on a true line with the axis of the torpedo. This shaft is ramed with rocket composition in the same way as rocket cases are filled.

The two parts are now screwed together, making a cigar shaped spindle. It is to be fired from below the water line from a guide or gun which is made with outboard and inboard valves. The outboard valve being closed, the torpedo is run into the gun, and a wooden sabot, with a hole in the centre of it, placed against its rear and fitting snugly in the gun. The projecting tube of the torpedo is supplied with a friction primer, which is carried through the breech valve by a wire. This valve is now shut and the outer valve opened, allowing the water to surround the torpedo in the gun to the sabot. The primer will ignite the composition and the pressure of gas acting against the sabot will force it with the torpedo out of the gun, when the sabot floats to the surface and the torpedo continues on its course propelled by the escaping gas like a rocket. Mr. W. thinks that these torpedoes would be excellent for harbor defense. Iron batteries stationed at intervals across a harbor's mouth and armed with these torpedoes would effectually close its entrance to an enemy. This paper created a very lively discussion in regard to the diabolic art.

We are pleased to learn that the Society is prospering and rapidly extending its influence. It has lately admitted a number of new active members, and among those on the list of honorary members may be mentioned Henry T. Brown, Gen. McClellan, W. P. Trowbridge, A. S. Hewitt and others.

Mechanical Progress.

PEAT FUEL FOR IRON WORKS.—The following is from the *Marquette Mining Journal*: "By far the most important enterprise, next to the development of our own mining interests, yet inaugurated, is the establishment of works for the preparation of *peat fuel* by the Lake Superior Iron Co. That peat fuel will prove better than either bituminous, anthracite or even charcoal, many well informed men believe. At other points the experiment has been tried, and with complete success, showing a large percentage of saving in the cost of fuel, while the iron produced has proved of very superior quality. It is not only in the reduction of iron ores that the value of peat has been shown, but in the refectory, the puddling furnace, the reverberatory furnace, the cupola and the forge. The heat it evolves is intense, and when properly condensed, being of much greater specific gravity than charcoal, it will bear, not only a greater blast, but a greater weight of ore. Mr. Dudley, of the Fishkill, N. Y., Iron Works, where peat has been used, says the heat is increased perceptibly, the amount of flux is lessened, and they make iron much faster, with twenty-five per cent. less cost than charcoal or anthracite. Mr. May, of the iron company at Maysville, Wis., says they have been using peat successfully, and he prefers it to any other fuel."

"From these premises it is argued, that our inexhaustible peat beds can be to us what the coal fields of Pennsylvania are to the iron interests of that state. Marquette county alone will be able to supply peat to a hundred furnaces for as many years to come, and would ultimately become the great iron center of the country."

T. H. Leavitt, of Boston, writes thus to the *Iron Age*,—in reference to peat fuel: "For the production of car-wheel iron and steel rails, it is claimed, by practical men who are now investigating the matter, that it is destined to prove of special value. Also, for iron for bridges, or other works subject to great tensile strain. Peat fuel from Lexington, has been used for melting and regning ordinary pig iron, producing an article of malleable iron, which, when cold, could be bent and twisted in all manner of shapes, exhibiting an astonishing degree of toughness and flexibility. I have seen wrought iron produced from the ore, by peat, in Canada, said to be of the very highest quality, and equal to the best Swedish iron; have seen it bent, when cold, and doubled up without a crack or flaw, the edges remaining smooth and sharp."

SKILLED ENGINE DRIVERS.—A competition between fourteen agricultural engine drivers took place at the recent meeting of the Faversham (Eng.) Agricultural Association. Mr. Aveling made a speech at the dinner afterwards, in which he gave the results. We quote from that speech which we find in part in *Engineering*: "The engine used for the trials was a portable of 8 horse power, to which was attached a friction brake similar to those used by the Royal Agricultural Society, and carrying a load equal to a duty of 8 horse power. The brake was fitted with a self-acting counter to indicate the number of revolutions obtained by each of the fourteen. Each driver was furnished with 84 pounds of coal and 8 pounds of wood; the height of water in the boiler was noted, and the difference in level at conclusion of trial was calculated at the rate of 500 revolutions per inch. The oil used was also accurately measured, the lubricators being filled up before the commencement of the trial by the driver who had just finished his run. The best driver obtained 8885 revolutions of the brake, which was equivalent to a consumption of 82½ tons in 250 days; the worst driver obtained only 6733 revolutions, equivalent to a consumption of 104 tons of coal in 250 days; the difference being 21½ tons per annum, or a value of 21. 10s. The smallest quantity of oil used was 1 oz., equivalent to a consumption of 17 gallons in 250 days; while the largest quantity of oil used was 3½ oz., equivalent to a consumption of 65 gallons in 250 days, so that the difference was 43 gallons, or a value of 13l. 4s. The results were as follows: Saving of coal per annum, 21. 10s.; saving of oil per annum, 13l. 4s.; total, 34l. 14s. Besides this, it must be noted that in ordinary work the worst driver would show a much worse result in comparison with the best. He thought these were questions involving either economy or waste which, to agriculturists, were of great importance, and deserved far more attention than was generally paid to them."

STREET CARS PROPELLED BY COMPRESSED AIR.—The *Chicago Times* describes a trial trip of the "pneumatic" car in that city. "The car is like an ordinary street car except as regards the roof, which resembles that of a palace sleeping car. In this are placed four hollow tanks, of copper, brazed together, of sufficient capacity to hold 150 cubic feet of compressed air, and of sufficient strength to resist a pressure of 260 pounds to the square inch. These tanks are charged by means of an air force-pump worked by a steam-engine. Beneath the seats, on either side, at one end of the car are two cylinders precisely the same as those of a steam-engine, connected with the wheels by cranks. After the filling of the tanks, which occupied but a few minutes, the company was divided. The first load consisted of thirty. The car started about the same as one drawn by a pair of horses, and bowled along at the rate of six miles an hour. The pressure on the gauge at starting was 175 pounds. After passing up the track for a mile, the car returned, making the last mile in a few seconds less than 10 minutes, and the gauge indicated that only 30 pounds of pressure had been used. The car was reloaded, and went another mile and one-quarter, when the pressure became exhausted. The tanks were only calculated to hold sufficient air to propel the car three miles. The trial was pronounced to be entirely satisfactory by the railroad men present, and some of them were quite enthusiastic in their praise of the invention."

THE BOTHWELL FLUX.—The New Haven correspondent of the *Iron Age* says: "On the 25th Oct., at the Birmingham Iron and Steel Works, a pile of 140 lbs. weight, composed entirely of *old files*, no other article of scrap steel entering into its composition, was heated with this flux applied, and in the absence of a steam hammer, worked in an ordinary alligator squeezer, and then rolled into a bar of 26 feet long, and 1½ inches square. This product of one heat compared favorably with the average German steel. * * The superintendent of the New Haven Spring Co., in order to determine the relative cost of the flux to that of borax, weighed out twelve ounces of each. With the borax were welded 12 sets of spring heads, or 48 heads. Amount of borax consumed, 7½ ounces. Twelve other sets of heads, or 48 in all, were then welded with the Bothwell flux, consuming 7 ounces."

The Philadelphia correspondent of same says of this, Dec. 8th: "Even with the present demand for steel, this flux furnishes a means of economical utilization of an article (scrap iron) hitherto difficult and costly to manipulate, and will save to every works using steel in quantity ten times its cost. As a perfect substitute for borax in welding, and at one tenth its cost, it is now working perfectly in the shops of the New Haven Spring Co., and in Bridgeport, and is rapidly being adopted by the shops throughout the country. With all these processes, and the continued progress made we are safe in predicting that the day of cheap and superior American steel is at hand."

CARVING MACHINE.—London *Engineering* for Nov. 4th describes Jordan's machine for producing carved decorations for ceilings, etc., which has recently been greatly improved. The bed-plate has two rails upon which runs a frame which has rails at right angles to the first, upon which the table runs. The workman can thus by means of two hand wheels and a treadle bring any point of a pattern placed thereon under a "tracer," which being done, several copies of the pattern are produced, one for each chuck bearing material to be carved. The decorations for the House of Lords were produced by this machine; a work which Sir Charles Barry said would have been impossible without it.

MACHINE KNITTING.—A single factory on the line of the New Haven Railroad, belonging to a New York house, employs 400 hands and represents a capital of \$200,000. It turns out more work than can be done by 7,000 hand knitters. All kinds of ornamental work can be done as well as by hand.

MANUFACTURE OF FIRE-ARMS.—The Winchester Repeating Arms Company made one single shipment to New York, from their works in Bridgeport, Conn., last week, of 3,500,000 cartridges, and over 6,000 guns. The company have an order for 1,000,000 more cartridges, to be filled in two weeks. They have just received another large order for their guns.—*Iron Age*, Dec. 8th.

Scientific Progress.

THE "CRITICAL POINT" BETWEEN THE LIQUID AND GASEOUS STATE.—A late number of Prof. Wurtz's *Chemical Repertory* gives a brief report of a meeting of the N. Y. Lyceum, from which we quote: "Prof. Seely explained his views regarding the recent wonderful discovery of Andrews, in experiments on liquefied carbonic acid, but applicable to volatile substances generally,—of a critical point of temperature for each substance, under sufficient pressure, at which its vapor occupies appreciably the same volume as the liquid, and at which there exists an intermediate condition between liquid and gaseous, and where small increase of temperature converts wholly into gas or vapor, and small decrease into liquid, without appreciable change of volume. Prof. Seely thought that the new fact could have been predicted from already known facts; namely from the observation of Regault that the latent heat of steam decreases about three degrees centigrade of rise, so that he calculated that at about 1700° C. we should have, in the case of water, a point, at which steam has no latent heat, and behaves merely like a gas. This he considered to be the critical point. Prof. Hyatt recalled in this connection, the old experiments of Cagniard de la Tour, who deduced from his results that the point at which water, as he supposed, remained liquid under sufficient pressure, was as low as a red heat, therefore much lower than Prof. Seely's calculation. Prof. H. Wurtz remarked that in the Sept. and Oct. nos. of the *Bulletin de la Société Chimique*, recently received, one of the Editors, M. Salet, points out that Drion, in the cases of chloride of ethyle at 170°, and sulphurous acid about 140°, had ten years before indicated precisely similar phenomena to those supposed by Andrews to be entirely new. This does not, however, detract from the fame of Andrews' discovery, no doubt made without knowledge thereof."

NORTHERN DRIFT IN NORTH WESTERN AMERICA.—Dr. Robert Brown, F. R. G. S., disputes, in *Silliman's Journal* for November, the general theory of the absence of this drift, giving as proof, the existence of boulders and rock-scratches. We quote briefly: "I combat this theory with extreme diffidence, knowing well from old experience the care and caution with which Prof. Whitney has proceeded in his remarkable geological survey of California, as well as in his earlier work on the shores of Lake Superior. * * As far as Alaska and California, and even Oregon and Washington Territory, are concerned, I must leave the question of glacial remains within their bounds, to observers more intimately acquainted with their country than I am, though I have a strong inclination to believe that what I say about other portions of the Pacific coast will hold equally good regarding them also. But with the coast of British Columbia and the whole of Vancouver Island I am very intimately acquainted, and can speak positively regarding the marked presence of true Northern Drift there; so that with every respect to the opinion of so distinguished a geologist as Prof. Whitney, I am compelled to dissent from his theory regarding the entire absence of glacial remains proper, from the Pacific slope of the Rocky Mountains."

THE NORTH POLE EXPEDITIONS.—Herr von Heuglia and Count Zeil, of the German Expedition, explored East Spitzbergen from July 15th to Sept. 15th. Herr A. Petermann, in a brief paper giving the main results of the expeditions of the present year says:—"Herr von Heuglia and Count Zeil have now discovered, 36 nautical miles to the east of Spitzbergen, a continent, extending from 79 deg. to 78 deg. N. lat.—therefore, from north to south, at least 60 (German) miles—which contains numerous sharply-pointed peaks, and which, in case it is really connected with Gillis Land, might at least equal Spitzbergen in size." This is claimed as the most important polar discovery that has been made for some years. Herr Heuglia has brought home with him from East Spitzbergen fourteen chests of geological, zoological, and botanical specimens. Herr Petermann announces that the Russian Expedition, which has been accompanied by the famous academician, Von Middendorff, has prosecuted interesting scientific researches between Novaya Zemlia and Iceland. Among other things, it is said, he has identified the Gulf-Stream as far as Novaya Zemlia at the very considerable temperature of +10 deg. Réaumur.

AURORA BOREALIS.—The following abstract of a paper upon this subject read before the American Association by Dr. Bradley of Jersey City is from the *American Chemist*: "Aurora Borealis is claimed to be one of the phenomena appertaining to atmospheric electricity which is caused by evaporation from the ocean. The evaporation of distilled water produces no electricity, but if the water contain an alkali or a salt, even in small quantity, there is chemical disaggregation, and the vapor is positively, while the solution is negatively, electrified. The average evaporation from the ocean equals about nine feet of water per annum. This reduced, gives the enormous amount of more than 2,000,000,000 tons per minute, consequently the vapors of the atmosphere, as a whole, are positively, while the earth and ocean are negatively electrified, and electrometers have shown that the higher we ascend, the more positive is the tension. According to the testimony of all observers, aurora borealis is always attended by a peculiar haze or veil, which, although allowing the light of the stars to pass, gives the sky a sombre aspect. This haze is now known to be composed of fine transparent icy needles. When such haze or particles of ice are precipitated from vapor highly electrified, the electricity becomes free and luminous. It is concluded, therefore, that the aurora arises from the electric discharges, which take place between the luminous icy particles which, in infinite numbers, communicate with the earth or moist air below."

COINCIDENCES OF COAST LINES AND MOUNTAIN SYSTEMS.—At the late meeting of the American Association Professor W. C. Kerr read a paper on "A Point in Dynamical Geology," a notice of which we copy from the *American Naturalist* for December:—"This paper called attention to the agency of the sun as a probable and sufficient explanation of the well-known and remarkable coincidences of the coast lines, mountain systems and chains of islands,—nearly all the great "feature-lines" in the physiognomy of the globe,—with the arcs of great circles tangent to the polar circles; the exceptions being generally arcs of great circles perpendicular to the former; inasmuch as the sun oscillates about (within 1° of) a position ($\pm 23\frac{1}{2}^{\circ}$ declination), which is approximately parallel to the above system of great circles, for more than one quarter of the year; and all the solar influences, mechanical (tidal), thermal, electromagnetic and chemical, being in full play for this long period, about this great dynamical plane which separates the luminous from the dark hemisphere, could not conceivably have failed to exercise a profound influence in outlining the rising ("becoming") features of the globe in its plastic and formative state. Similar considerations are applicable to the lunar influence, which was cumulative in the same direction."

DETECTION OF SULPHUR IN COAL GAS.—M. Ulex gives the following method: Let a platinum basin be filled with half a litre of water, and the basin be heated over a Bunsen burner until all the liquid has evaporated; the basin will be found to be coated, on the outside, where it has been struck by the flame, with a dirty, greasy-looking substance, which, on being washed off with pure distilled water and tested, proves to be sulphuric acid. The author further points out that the glass chimneys used with Argand gas-burners soon become coated over internally with a white substance, which, on being washed off with distilled water, will be found to be, on testing, sulphate of ammonia. The glass panes of a room wherein gas has been burned for a few evenings consecutively will, when rubbed with the fingers of a clean hand, impart to it a substance which, on the hand being rinsed in distilled water, will yield a precipitate of sulphate of baryta with chloride of barium, and a brick-red precipitate with potassium-iodide of mercury.

THE ECLIPSE.—Nature says that "should the weather be favourable, we may expect such a series of observations as has never been made of an eclipsed sun. As at present arranged, there will be four parties. Beginning with Spain, we have one to Cadiz, in charge of the Rev. S. J. Perry, and one to Gibraltar, under Captain Noble. The English branch of the Anglo-American Expedition will be under the charge of Mr. Lockyer; while there will be a fourth small expedition, under the charge of Mr. Huggins, to Oran; the Cadiz, Gibraltar, and Oran parties will leave Portsmouth on the 5th of December in the *Urgent*. The Sicilian party will leave London on the night of the 7th by the Brenner pass, a ship of war meeting them at Naples."

AGRICULTURAL DEPARTMENT.

SUBSCRIBERS TO OUR FARMING EDITION will receive the first number of the PACIFIC RURAL PRESS, January 7th, instead of the SCIENTIFIC PRESS. We suppose that they will prefer that sheet, but if any do not, we will transfer their name back to the SCIENTIFIC PRESS list and send back numbers when requested.

California Fruit Crop for 1870.

The *Bulletin* of Tuesday last gives a tabular statement of the California fruit crop for the past year, made up from statistics furnished by leading dealers in this city. As this is the first attempt to tabulate this business, the paper making the attempt acknowledges that the work has been very imperfectly done. For instance the grape product of the state is set down at less than 6,000 tons, which amount would scarcely produce one-fifth of the estimated wine product of the state, to say nothing of the immense quantities of this fruit which is consumed in its natural state. The grape crop has undoubtedly reached at least five times the amount set down, or 30,000 tons.

Still the details as given in this table are very interesting, and probably approximate quite near the truth with regard to the other fruits enumerated. Twenty-one varieties of fruits are named; and it appears that apples, apricots, cherries, grapes, peaches, pears and plums are raised in nearly every county in the state. Our Blackberries are chiefly from Alameda, Napa, Sacramento, San Joaquin, Santa Clara, Solano and Sonoma counties. Alameda and Santa Clara counties send us nearly all our currants. The best Fig counties are Sacramento, San Joaquin, Sierra, Solano and Yuba counties. The same counties also furnish us with the bulk of our Nectarines. The counties producing the largest quantities of Prunes are Alameda, Placer, Sacramento, Santa Clara, Sierra and Yuba. Our supply of Raspberries is chiefly due to Alameda and Los Angeles counties. Santa Clara is the banner county for Strawberries, the yield there being nearly 75 per cent. of the total product. Most of the Quinces raised come from Los Angeles, Santa Clara and Yuba counties. Nearly all the Oranges, Lemons, Limes and Citron, produced in the State are raised in Los Angeles county, while all the Cantaloupes and Watermelons are furnished by Sacramento county. The Gooseberry crop is light, scarcely reaching 100 tons, and Alameda probably raises more than any other county in the state.

It is safe to say that nine-tenths of all that is raised except grapes, seeks San Francisco for a market, and that at least one hundred tons of the quantity sent here decays or is otherwise wasted before it passes into the hands of consumers.

The aggregate value of the fruit raised in the state is set down in the table referred to at \$2,371,612. Twice that amount would probably be much nearer the correct figure. The table, as given, however, is valuable if for nothing but to call attention to the great importance of the fruit interest of the state. The consumption of fruit on this coast is increasing every year, and in a much larger ratio than the population. This fact, in connection with the improved demand for our home dried and preserved fruits, gives assurance that this great interest will be still more appreciated hereafter, and more fully and profitably developed.

A VALUABLE GATE LATCH.—A student in the Michigan Agricultural College has invented a gate latch for which he received \$10,000.

Cotton in California.

The letters which have recently been published by Col. J. L. Strong, on cotton raising in California, appear to be attracting an annual amount of attention throughout the State, and the fact that he is making preparations to plant 800 acres on his own account, the coming season, coupled with his known experience in cotton planting in the Atlantic States, and the extended experiments made by his brother in this State, affords abundant evidence of his confidence in the business. While it is possible that some of his calculations may be rather overdrawn, he has certainly presented sufficient data to warrant limited experiments in all those portions of the State where the soil and climate appear to be favorable to the undertaking. The costs of such experiments will be but trifling; while the possibilities of success are quite sufficient to warrant even much larger outlays than are required.

Notwithstanding the large scale upon which he proposes to enter upon the business himself, he does not advise those unacquainted therewith to do more than merely experiment, for the first year or two.

The raising of cotton requires actual, personal experience, and mistakes must unavoidably be made at the outset. If the enterprise is a large one such results will be likely to end in discouragement; while if it is undertaken on a small scale, the lesson taught by a failure may lead to certain and profitable success.

The idea thrown out by a cotemporary that the present excitement has been set on foot in the interest of a cotton seed speculation is not borne out by the facts in the case. No extravagant price is demanded for the seed, and the limited sale to be expected leaves no room for any money to be made in that direction.

Col. Strong is not a visionary man; but an experienced, practical cotton planter, and a very intelligent gentleman. He has passed through the experimental field in this State, through the agency of his brother, J. M. Strong, of Merced county, and has now come hither with the view of entering largely upon the business himself, and of introducing it into the state generally. With this end in view he will make California his future home, and is willing to impart to all who may desire to experiment in Cotton Culture, all the information that may be necessary to such undertaking. The Colonel has promised us a series of articles on the culture of Cotton, the publication of which we hope to commence at an early day. They will appear in both the SCIENTIFIC PRESS and in the PACIFIC RURAL PRESS, and will contain all the information needed to enable a person unacquainted with the business to institute a series of experiments, which will lead to a full and practical knowledge of the same.

A MARIN COUNTY DUCK RANCH.—Mr. Hugh McKennon has a duck ranch in Bolinas, Marin County, where he is now feeding about 2,500 of these birds. He has a very complete arrangement of buildings, pens, etc., for his flock. The ducks have constant access to a large pond of fresh water, and also to a part of Bolinas Bay. He sends during the egg season, an average of 1,050 eggs per day to this market, down to 250, as the season falls off. The ducks consume an average of 55 tons of the best wheat, during the year, and he is constantly renewing his stock by selling the old ones and raising young ones.

VALUABLE COW KILLED.—On Friday of last week a valuable Durham, thoroughbred cow, belonging to Dr. Holden, of Stockton, strayed from her inclosure and was run over and killed on the Northern Pacific railroad. She gave from 30 to 32 quarts of milk daily the last grass season, and was valued at \$400.

Agricultural Suggestions, Etc.

FROM OUR CALIFORNIA EXCHANGES.

[We propose to collect and give, from week to week, in the form of extracts and condensed paragraphs, the cream of such agricultural advice and remarks as we may find in our California exchanges. Such information, coming fresh, and generally from practical minds, cannot be without interest and value on this coast, where the conditions of farming are so diverse from those to which we have been accustomed in the Eastern States—and where we must consequently build up a new school of experience. Let us learn of one another.]

"That's What's the Matter."

The *Vallejo Recorder* says:—"The State, to be prosperous, must have her fields cultivated. They cannot be cultivated when they are held in the hands of monopolists. They are not likely to be properly improved unless the title is in the occupant. The high prices and the uncertainty in the titles, and the policy of keeping the grants in the hands of a few individuals, have injured our State more than all other evils combined. If there is anything that should be distributed among the people, it is the land of the country. Nature has so ordained that to bring forth a varied production the land must be divided into small tracts. Any people who pursue a different policy will be sure to experience its blighting effects, as we have done. All our natural resources, and gold in our mountains, have not been sufficient to overcome the bad land policy. Our cities have been at a stand, if not retrograding, during the last two years. They will continue to stand still, or grow less, so long as cheap land can be had in the Mississippi plains and we continue our bad policy. We will become prosperous when ever we can insure the immigrant that he can get good land, at a reasonable price, and be certain of his investment. Not until then."

Improved Tillage.

Every intelligent farmer will unhesitatingly admit that the system of tillage practiced in California is the most miserable in the world outside of countries where the people are wholly enlightened. The plan followed is to get the seed into the ground by the most hasty and inexpensive method possible, and then let nature take its course, and if a crop is obtained, well and good, and if results prove adverse to hopes and expectations, the seasons are charged with the failure, and sermons preached about the precariousness of agricultural pursuits; whereas, in fact, the sure road to success is that of deep and thorough tillage, a path in which but few appear inclined to travel. The farmer who merely scrapes the surface of his land year after year and continually raises the same kind of crop, has no right to expect a good yield, and a light gathering of grain on the harvest field may only be considered the legitimate reward for the efforts used in assisting nature. Land, like animated nature, can be exhausted; and it is simply nonsense to expect one or two inches of the soil on the surface of the land to produce a paying crop of wheat or any other cereal for a series of years in succession. Repeated shallow plowing has the effect of making the sub-soil as hard as a street pavement and utterly impervious to the small, thread-like roots of grains and grasses; hence the superior crops produced on new lands for a year or two after they are first brought under cultivation. We believe that the dawn of sure and permanent prosperity in agricultural pursuits in California is not likely to become visible until such time as "small arms" come in vogue, and individual labor be confined to a more limited area of ground than is the practice at the present time. We have heard practical agriculturalists contend that it is only farming, or rather grain-raising on a large scale that can be made to pay; that a sum of not less than two thousand dollars is required to be invested in agricultural implements and harvesting machinery, and that no person farming on a small scale can afford to invest such amount. This difficulty could be easily obviated by several combining in the purchase and use of harvesting machinery, or expenditure in purchase altogether avoided, as is already the case in many instances, by hiring the use of a reaper and thresher. —*Stockton Independent*

Farm Improvements.

A correspondent of the *San Jose Mercury* makes the following sensible and timely remarks upon the importance of the character of our farm improvements:—"Many of us have heretofore been in doubt about the title to our land. No one likes to put fine improvements upon land which he may be dispossessed of at any time. Consequently our houses, barns, fences, etc., have been of the meanest and most shiftless kind. Our wives and daughters have been discouraged and disheartened; for, shanty keeping is not housekeeping. But

now a new order of things is established. Our titles are perfected and we can go ahead with confidence, and whenever we build improvements let these words be uppermost in our minds; beauty, convenience and durability. Let us have no more dingy wood-colored houses; no more tumble-down stables and splinter fences. But when we build a house let it be shapely, with high ceilings, and good large windows, to let in the cheerful sunshine of heaven. Let it be painted a cheerful color, and have in front a neat flower garden where our wives and daughters can spend each day an hour or two cultivating the beautiful things God has given us. People who live in pleasant homes are apt to be pleasant in disposition. And then the children—think what an influence for good it exerts over them."

Eastward Fruit Shipments.

The shipments of California fruit to Colorado, the present season, has aggregated 750 tons, made up of apples, pears, plums, grapes, etc. The aggregate value of the same is put down at \$57,000—this to Colorado alone. Nevada and Utah have also taken immense quantities.

The shipments to Chicago in "refrigerator cars" has also been very large, and been attended with much greater success than was met with the previous season. Notwithstanding the misgiving with which the inception of this business was attended, it now promises to open up an immense source of wealth to this State, especially when we take into consideration the vast increased population of the Sierras and the Mississippi river, and which must even depend in a great measure upon California for its supply of fruit.

There is very little danger of overdoing the fruit business in this State if due regard is had in setting out orchards and vineyards, to the kind and quality of fruit raised for the special markets, which it is intended to supply. It costs no more and requires no more ground to raise good fruit than it does to produce that of inferior quality; while the price obtainable for the former is often twofold that of the latter, with a sure and ready market.

A GOPHER ENCLOSED IN A TURNIP.—A farmer's wife, in Contra Costa, cut open a turnip, and found a gopher dead in its center. The little fellow had eaten its way into the turnip, which had taken new life and closed the hole, or else be laid in its way and it grew around him—one of the two—the farmer's wife says. At all events, that gopher won't go for any more turnips.

THE GRASS VALLEY UNION urges the importance of introducing Eastern trees and birds into this State. Of the former it thinks that black walnut, ash, elm, etc., could be cultivated here with profit; and that mocking birds would prove a good addition to our ornithological family.

FLAX.—The *Monterey Democrat*, learned from Mr. Blanshenship the other day that he will be one of a party of three who will seed in flax one hundred and fifty acres of the Santa Rita Rancho.

THE ENGLISH FRUIT CROP, for this season, says the *Gardener's Chronicle*, has been the largest known to the present generation.

THE FIRST SHIPMENT OF ORANGES, this season, from Los Angeles, was received here, the past week, by the Orizaba. It consisted of 57 boxes from the Wolfskill orchard.

VINICULTURAL SOCIETY ELECTION.—At the annual meeting of the Buena Vista Vinicultural Society the following named gentlemen were elected Trustees: William Blanding, Chr. Christianson, William C. Ralston, O. C. Pratt, Charles Baum, John Bensley, Charles Kohler, B. E. Myers and Walter M. Rockwell. The Board was subsequently organized by electing W. Blanding, President; C. Christianson, Vice President; Supervising Committee—O. C. Pratt, W. Blanding and C. Kohler. M. Philipp, Secretary.

What I Know of Farming—No. 47.

Large and Small Farms.

There is fascination for most minds in naked magnitude. The young colonel, who can hardly handle a brigade effectively in battle, would like of all things to command a great army; and the tiller of fifty rugged acres has his ravishing dreams of the delights inherent in a great Western farm, with its square miles of cornfields, and its thousands of cattle. Each of them is partly right and partly wrong.

There are generals capable of commanding 100,000 men. Napoleon says there were two such in his day—himself and another; and these generally find the work they are fit for, without special effort or aspiration. So there are men, each of whom can really farm a township, not merely let a herd of cattle roam over it unfed and unsheltered, living and dying as may chance; the owners expecting to grow rich by their natural increase. This ranching is not properly farming at all, but a very different and far sulkier art. I judge that the farmers who can really till—or even graze—several thousand acres of land, so as to realize a fair interest on its value, are even scarcer than the farms so capacious.

But there is such a thing as farming on a large scale; and it is a good business for those who understand it, and have all the means it requires. The farmer who annually grows a thousand acres of grain, and takes reasonable care of a thousand head of cattle, is to be held in all honor. He will usually grow both his grain and his beef cheaper than a small farmer could do it, and will generally find a good balance on the right side when he makes up and squares his accounts of a year's operations. I could recommend no man to run into debt for a great farm, expecting that farm to work him out of it. But he who inherited or has acquired a great farm, well stocked, and knows how to make it pay, may well cling to it, and count himself fortunate in his possession. But the great farmer is already regarded with sufficient envy. Most boys would gladly be such as he is; the difficulty in the case is that they lack the energy, persistency, resolution, and self-denial requisite for its achievement.

We will leave large farms and farming to recommend themselves, while we consider more directly the opportunities and reasonable expectations of the small farmer.

The impression widely current that money cannot be made on a small farm—that in farming the great fish eat up the little ones—is deduced from very imperfect data. I have admitted that grain and beef can usually be produced at less cost on great than on small farms, though the rule is not without exceptions. I only insist that there are room and hope for the small farmer also, and that large farming can never absorb nor enable us to dispense with small farms.

I. And first with regard to fruit. Some tree-fruits, as well as grapes, are grown on a large scale in California—it is said, with profit. But nearly all our pears, apples, cherries, plums, etc., are grown by small farmers or gardeners, and are not likely to be grown elsewhere. All of them need at particular seasons a personal attention and a vigilance which can seldom or never be accorded by the owners or renters of large farms. Should small farms be generally absorbed into larger, our fruit culture would thenceforth steadily decline.

II. The same is even more true of the production of eggs and the rearing of fowls. I have had knowledge of several attempts at producing eggs and fowls on a large scale in this country, but I have no trustworthy account of a single decided success in such an enterprise. On the contrary, many attempts to multiply fowls by thousands have broken down, just when their success seemed secure.

Yet, I judge that there is no industry more capable of indefinite extension, with fair returns, than fowl-breeding on a moderate scale. Eggs and chickens are in universal demand. They are luxuries appreciated alike by rich and poor; and they might be doubled in quantity without materially depressing the market. Our thronged and fashionable watering-places are never adequately supplied with them; our cities habitually take all they can get and look around for more. I believe that twice the largest number of chickens ever yet produced in one year might be reared in 1871, with profit to the breeders. Even if others should fail, the home market found in each family would prove singularly elastic of reception.

This industry should especially commend itself to poor widows, struggling to retain and rear their children in frugal independ-

ence. A widow who, in the neighborhood of a city or of a manufacturing village, can rent a cottage with half an acre of southward-sloping sunny land, which she may fence so tightly as to confine her hens therein, whenever their roaming abroad would injure or annoy her neighbors, and who can incur the expense of constructing thereon a warm, commodious hen-house, may almost certainly make the production of eggs and fowls a source of continuous profit. If she can obtain cheaply the refuse of a slaughter-house for feed, giving with it meal or grain in moderate quantities; and according that constant personal, intelligent supervision, without which fowl-breeding rarely prospers, she may reasonably expect it to pay, while affording her an occupation not subject to the caprice of an employer, and not requiring her to spend her days away from home.

III. Though the ordinary market vegetables may be grown on large farms, the fact that they seldom are is significant. Cabbages, peas, pole beans, tomatoes, and even potatoes, are grown on small farms, as they always have been. There are sections wherein no cash market for vegetables exists or can be relied on; and here they will continue to be grown to the extent only of the growers' respective needs; but wherever the prevalence of manufactures or the neighborhood of a great city gives reasonable assurance of a market, they are grown at a profit per acre which is rarely realized from a grain crop. No less than \$100 per acre is often, if not generally, achieved by the growers of cabbage around this city; and this not from rich, deep garden-mold, but from fair farming land, under-drained, subsoiled, and liberally manured.

The careless, slipshod farmer may do better—that is, he will not fail so signally—in grain cultivation; but there are few more decided or brilliant successes than have been achieved within the last few years within sight of this city, and wholly in the tillage of small farms.

I trust I have here said enough to show that there is a legitimate and promising field for agricultural enterprise and effort, other than that which contemplates the acquisition and rule of a township, and that, while farming on a large area is to many attractive and aspiring, there are scope and incitement also for tillage on a humbler scale—for tillage that permits no weed to ripen seed, and no nest of caterpillars to flourish a month undisturbed—for tillage that achieves large crops and profits from small areas, and rejoices in that neatness and perfection of culture attainable only in the management of small farms.—*Horace Greeley.*

SAN DIEGO VS. NICE FOR INVALIDS.—Nice, on the Mediterranean, having recently been recommended as a place of residence for invalids, a writer to a New York journal states that, having spent several months in Nice for the benefit of his health, he can verify all that has been said of that city. He, however, considers it important that the people of the United States who do not desire to visit Europe, should know that San Diego, California, is decidedly preferable to Nice as a residence for invalids. He says that during the past extremely hot weather at the North, the thermometer at San Diego only reached 83 degrees Fahrenheit, and then only for three quarters of an hour at mid-day. He states that there are no frosts at San Diego, the thermometer seldom falling below 50 degrees, while it usually ranges 50 to 55 degrees. Complaints of the chest and lungs, and rheumatic affections, it is asserted, rapidly disappear in the climate of San Diego, while fevers are unknown.

ANOTHER MULBERRY PLANTATION.—The Lower Lake Bulletin says Messrs. C. Hallin and G. Amery have purchased a tract of land near the Pike County House, in Napa County, where they will immediately set out 10,000 mulberry trees, preparatory to entering largely upon the business of sericulture.

SULPHATE OF AMMONIA FOR WHEAT.—An exchange says that sulphate of ammonia is used in England as a fertilizer, on crops of wheat and grass, and with good results. The demand for it for this purpose is growing rapidly. It has been found very profitable when applied to sugar cane and beet roots.

AGRICULTURE is a theme which must always be one of the newest and freshest in the world. "Age cannot wither it nor custom stale its infinite variety."

HORSES and cattle are dying in Fresno county from eating some noxious weed.

S. F. Domestic Produce Market.

SAN FRANCISCO, Thursday, P. M., Dec. 22d.
FLOUR—Is still in small demand for export; although the demand for local trade continues fair. We note no changes in prices from last week. Standard Oregon brands are quotable at \$6.37@6.50; local brands—superfine, \$5.25@5.50; extra \$6.37@6.50. An improved demand for China is expected as the result of advices from the China steamer which arrived Tuesday.

WHEAT—Is without change. Sales have aggregated about 45,000 sacks. We quote the range of all kinds at \$1.95@2.15; good to choice shipping, \$2.12@2.15; choice milling, \$2.15. Liverpool quotations came through Tuesday 11s 3d@11s 4d. New York rates remain unchanged—\$1.62@1.65 per bushel.

BARLEY—Is still in fair demand, and prices have remained unchanged during the week. We quote \$1.25@1.35, from fair to choice. Sales of some 28,000 sacks are reported.

OATS—The market still continues inactive. Fair to good may be quoted at \$1.32@1.60.

CORN—Has advanced to \$1.65½ @ 100 lbs for good yellow, at which figure the latest sales have been made.

BUCKWHEAT—Nominal at \$2.50@3 from the wharf.

RYE—In limited demand. The latest sale is reported at \$2.12½.

FEED—Remains with but little change. We quote HAY a little easier at \$10@15 from fair to choice; STRAW, \$7@9; BRAN, \$28@30; MIDDINGS, \$35@40 per ton; OIL CAKE MEAL \$28.00.

HONEY—In good demand at the following rates: Los Angeles, 5-gal cans, \$12@16, and Potter's, 2 lb do, at \$4½ dozen.

POTATOES—Market firmer for all descriptions. We quote common \$1.40@1.75; Sweet, \$1.62@1.75.

HOPS—This year's crop is still quotable at 10@12½c.

HIDES—We quote Dry, slaughter's stock, 17@18½c; Salted; 8½@9½c. Sales during the week 1422 Cal. dry.

WOOL—No transactions of importance to report. We quote good shipping, at 15@17c; very choice, 18c; burry, 10@12½; slightly do, 13@14c.

TALLOW—Quotable at 7½@8½c; the latter an extreme figure.

SEEDS—California Mustard, none in the market; Flax 3@3½c, Canary, 7@8c.

BEANS—Quiet at the following rates. Bayo at \$2.25@2.50; butter, \$2.50 for small, \$3 for large; small white and pink \$2.00; pea and red \$2.25 per 100 pounds.

FRESH MEAT—Beef in good supply with something of an advance in prices. We quote prices from slaughterers to dealers:

BEEF—American, 1st quality, 10@17c @ lb.
Do 2d do 8@9c @ lb.
Do 3d do 6@7c @ lb.

VEAL—From 9@12c.

MUTTON—Steady at 7@8c @ lb.

LAMB—8@10c @ lb.

PORK—Undressed at 5½@6½c; dressed, 8½@9½c @ lb.

POULTRY, ETC.—The market is well stocked, and prices unchanged. Spring Chickens, \$5@6; Hens \$7@8.50; Roosters, \$7@8.50; Ducks, tame, \$6@7 @ doz; do wild, \$2@3.00 @ doz; geese, tame, \$2@2.50 @ pair; wild \$1.75@3 @ doz; tame Turkeys, 17@19c @ lb; Hare, \$2.50 @ 3 @ doz; Doves, 50c do; Quail, \$1.25@1.50; Snipe, 75c do; do English, \$1.50 do. Venison, 8@9c @ lb.

DAIRY PRODUCTS—Rule lower; California Butter, Fresh, in rolls, 40@50c; ordinary, 32@40c; Irkin, 35@42c @ lb. Cheese is in fair supply—California, new, 12@14c, Eastern, 17c. Eggs, California fresh 42@50c; Oregon, 37½@40c. California Lard, 11-lb tins, 12@13½c; Oregon, 13½@14½c, according to package.

FRUIT—We submit the following prices, for which we are indebted to A. Lusk & Co.: Apples, per box, eating \$1.25@2; cooking, \$1@1.50. Grapes, per pound, native, 4@5; foreign, 10@20c. Pears, per box, eating, \$2@3; cooking, \$1.25@1.50. Strawberries, per pound, 15@20c. Oranges, per M, \$35@50. Lemons, per box \$4; per 100, \$4. Cocoanuts, per case, \$1@8. Pine Apples, per doz., \$9.

CASE GOODS—In 2 lb cans, per doz., Apricots, \$4; Apples, \$2.50; Blackberries, \$4; German Prunes, \$4; Grapes, \$4; Peach, table, \$4; Peach, pie, \$3; Pie, assorted, \$3; Plum, table, \$3.50; Plum, pie, \$3; Pears, \$3.75; Quince, \$3.50; Tomatoes, \$2; Table, assorted, \$3.75.

GENERAL MERCHANDISE.

AGRICULTURAL IMPLEMENTS—Have been in good demand since the late rains, and a good demand is expected to continue for the season.

BAGS AND BAGGING—Are in moderate request only, and will not be until the approach of the coming season. We quote wool bags at 50@52½c. Oat Sacks 23x40, 12½c; 23x35, 18c; Potato Gunnies, 24½@25c; imitation Dondees, 19@20c.

BUILDING AND FENCING MATERIALS—We quote wholesale rates to dealers: Redwood Rough at \$18; do Siding, \$22.50; do Surfaced, \$30; Fencing Pickets, \$30; Oregon Rough, \$17; do Flooring, \$27; do Fencing, \$18; Laths, \$3@3.25, and Redwood Shingles, \$2.75 @ M.

DRIED FRUITS—In moderate request. We quote the market as follows: Cal. Dried Apples, 5½c; Oregon do, 6½c; Langue de Almonds, 25c; Figs, Smyrna, 15@20c; Prunes, Hungarian, 14@16c, for old and new respectively, @ lb; Raisins, layer, \$4.50@5; Currants, Zante,

14½@15½c, for old and new; Citron, 40@42½c. **PROVISIONS**—The stocks of all kinds of Cured Meats are in fair supply, and a good demand continues to exist. We quote jobbing rates as follows: Hams, California, at 13@13½c; Oregon do, 16½@17c; Bacon, California, 15@15½c; Oregon do, 16½@17c; Lard, California, 12½@13½c; Oregon do, in kegs, 12½@13½c @ lb.

[ADVERTISEMENT.]

Interesting Facts for Farmers About Ramsdell's Norway Oats.

The New York Tribune, after giving a concise history of these oats says: Believing that we could not confer upon the agricultural community a greater favor than by ascertaining the production of this grain, we requested Ramsdell & Co., to furnish us with the original letters from the farmers in different parts of the country, who have grown them during the past year; a request which was cheerfully complied with: After some weeks of careful examination of this voluminous correspondence, we have satisfied ourselves of the genuineness of these letters. They are from farmers residing in every part of the United States.

By adding up the results in many hundred cases where the rate per acre was distinctly stated, we have found the average to be seventy eight bushels to the acre. The average yield of the ordinary oat, during the past five years, as estimated by the Commissioner of Agriculture, is from thirty to thirty-two bushels per acre. An examination of the correspondence from which this table is prepared, goes to show that the straw of this variety is more nutritious than common oat straw, and we recommend it as a valuable addition to what we now have for early feed in green soiling cattle.

Beware of Spurious Seed.

Nearly or quite all the unfavorable reports which have come to the ear of the public with regard to these oats, have been due directly to spurious seed; the high price that the Norway oat bears, operating as an inducement to swindlers. Buy no seed unless genuine. See below from whom and how to get it in this city.

PRICES.

By mail, postage paid, 2 lb. packages, 75 cts.; 5 lbs., \$1.75. By express (not prepaid), 16 lbs., \$4; 32 lbs., \$7.50. In large quantities at still greater reduction.

CLUBS.—We advise parties desiring to buy small quantities only, to unite with their neighbors in a joint order, making the cost less for cash.

Our Agents will receive orders for these oats on the above terms.

For these Oats, in large or small quantity, send direct to the Pacific Rural Press office, 414 Clay St., San Francisco, DEWEY & CO., Agents.

Farmers' Gardens.

There are many anomalous features and inexcusable defects in the system of agriculture as practiced in California. We shall endeavor from time to time and in the appropriate seasons to point out some of these defects and suggest the remedies, in hopes that by so doing we may induce a better, more thorough and economical system of farming, and thus bring more profit to individual farmers, and comfort and convenience to their families, as well as increased prosperity to the common wealth.

One of the most striking of these features and one that requires attention at the present time is the almost entire absence of vegetable gardens throughout the great grain districts of the state. In many of these districts one may travel hundreds of miles through flourishing wheat and barley fields, passing the residences of well-to-do farmers and not see a solitary vegetable garden worthy of the name.

Californians, as a general thing, are too apt to exert all their energies in a single direction and trust all their chances of success—all their hopes of a fortune to the throwing of a single die. Greatly to the disadvantage of our agriculture this one idea system of farming has absorbed the attention and monopolized the energies of our agricultural communities. Wheat and barley have been and are still too much the exclusive product of the state.

No agricultural country can be assured of an uninterrupted and continuous prosperity unless it produces as near as may be all the necessities of life. As our agricultural industries are now situated two or three seasons unfavorable to wheat and barley would render by far the larger portion of our farmers poor if not completely bankrupt. As it is with a state or large community so it is with smaller ones, or with individuals and families. Those who depend for a livelihood upon the products of the soil should endeavor to produce as near as may be all the varieties of food they consume. Especially should no farmer in this state be without a well tilled and well stocked vegetable garden. One-half acre well prepared, planted and cultivated in a good variety of garden vegetables will administer more to the real wants, comforts, health and happiness of a family and will save more money to its owner than ten acres devoted to wheat, barley or other ordinary field crops.

Again, the garden is the place for experiments. It should be miniature an experimental farm. The man who really becomes interested in and cultivates a good garden, will become a better and more intelligent and successful farmer. By degrees he is led to study more closely the nature and wants of the soil—the treatment adapted to different kinds of plants and by degrees he applies the lessons learned in the garden to all his farming operations.

The garden is also a great economizer and utilizer of a farmer's time. Suppose that every farmer in the state had at the present time a good vegetable garden attached to his home, how many hours in the aggregate, now wasted in idleness, would be turned to good account—and how many more necessities and luxuries would be enjoyed by the families throughout the agricultural districts. How many dollars, now worse than wasted in bar rooms, and at idle games would be devoted to rendering our rural homes, more comfortable, beautiful and attractive.

Again, the farmer who cultivates a garden must of necessity, and by his own experience, learn the important fact that his success does not depend so much on the number of acres cultivated, as upon the manner of their cultivation, and not so much upon the quantity of any one crop produced, as upon the excellence and variety of his crops. The almost universal neglect of vegetable gardens among our farmers may be set down as one of the principal causes if not the principal cause that operates against a more general or universal success of the agriculturists in our state. Strange as it may seem, many of our grain farmers buy almost every article of food consumed in their families from one year's end to another. All the beef, pork, mutton, or other meats; all the potatoes, cabbages, turnips, onions, beans, peas, tomatoes, and other vegetables; all the fruit, and even butter and cheese used

in their families for the year, are bought, and have to be paid for out of the proceeds of a single crop of wheat and barley. Thus is kept up a constant drain upon their purses, every day of the year, from the time that one crop of grain is sold until it is time to sell another—and in many cases this drain becomes so great that the proceeds of the grain crop have to be anticipated, and debts accumulate.

Then, under such circumstances, if the crop of grain fails, what is the condition of the improvident farmer? Too many have already stared this condition of things in the face, and too many have been thus compelled to reap the reward of this imperfect and reckless system of farming so prevalent in our state. As a counterpart to this want of farmer's or kitchen gardens in the country, we find many extensive and well-cultivated gardens clustered about every city and town in the state, so that our markets are as well if not better supplied with vegetables, the year round, than any other country in the world. Our vegetable dealers, in all our towns and cities, are among the most successful and prosperous tradesmen in the state, and anomalous as it may appear, yet it is a fact, that more of the wealth of these tradesmen has been gained from the profits on sales of vegetables to the farmers of the country than to residents of the towns and cities.

The country pedlar is an institution that may be met with the world over. He generally travels from house to house among the farmers, selling dry goods, tinware, Yankee notions, and things of a similar character. In California we have this same indispensable institution performing the same duties and supplying the same wants. But here we have also a country pedlar of another character—one, under the circumstances, more useful and indispensable to the agricultural or grain districts than the one above referred to. He is peculiarly a Californian institution. He is in fact the grain farmer's portable vegetable garden. He buys his vegetables of the dealers in the towns and cities and peddles them about the country. As he deals in articles that everybody in the grain districts wants and scarcely anybody produces, his business is a profitable and prosperous one. But the fact that his occupation is necessary is a scandal to California agriculture. And the fact that our farmers pay the professional gardeners a good profit on all the vegetables they consume, and then pay the dealer and pedlar their liberal profits for handling and conveying them from point to point, is anything but complimentary to the energy, enterprise and skill of the farmers themselves. So long as such a state of things is allowed to continue, so long will farming in California continue to be an uncertain, speculative occupation, instead of, as it may be, a sure, safe, reliable and profitable business.

We are aware that many farmers claim that, under the dry climate of California, vegetables cannot be profitably raised in the wheat growing districts of the state. We are also aware that but a few years ago the same doubt was almost universal in regard to the growth of small grains on these same soils. Time and experiment have fully controverted the latter doubt, and we firmly believe that a little more time and a little more experimenting will as fully controvert the former. We believe the defect is not in the climate nor yet in the soil; and in our next we will endeavor to show that our belief is well founded. We will also endeavor to point out to our farmers the time for planting and mode of cultivation necessary to be pursued in order to succeed in making good vegetable gardens in the grain raising districts, and thus secure to all good, fresh and healthy vegetables from their own grounds.

The Profits of Farming.

In resuming our remarks on the "Profits of Farming," we would premise that the surest guarantees of success therein are industry and frugality. More farmers fail in being what they wish to be, or in gaining what they want, from lack of these requisites, than from any other cause.

Industry and economy, coupled with judgment, constitute the best capital with which a young man can start in life. If he has money, he may lose it; but early, well-formed habits of industry will never fail him, and will always stand in the place of money capital. But it is indispensable that his industry should be guided by judgment.

In seeking a farm a man should carefully calculate his means, the available labor force at his command, (size and character

of his family, perhaps,) his past experience, if he has any; the relative positions of his farm and the market where he must dispose of the products which he proposes to raise, and various other contingencies which will always present ample scope for the exercise of judgment.

We have already shown what can be done in wheat culture; but for permanent success we should prefer diversified farming, which may be commenced on even a very small scale—in fact without any capital at all beyond the industry and economy already spoken of.

Profits of Poultry Raising.

An instance of success in this industry was recently brought to our notice, in which a poor man secured a good start in two years, with less than one hundred dollars to begin with. The case was that of an industrious German, who took up some government land within a few miles of Marysville, built a little cabin, purchased a few chickens and turkeys for a start, which were enabled to pick their own living among the bushes, while the industrious proprietor hired out to his neighbors when he could get a job, and cut wood on his claim when no work was to be had. In the meantime his chickens and turkeys grew and increased so that at the end of eighteen months, (covering the second spring and summer of his occupation) he had sold poultry and eggs to the amount of \$1,500 over and above what his fowls had cost for their keep. This was in addition to what he had otherwise earned by his labor, which was considerably in excess of what it had cost him to live. All this was the result of a little industry and economy. Moreover, his moderate capital of \$100 had increased to five or six times its original amount.

Our friend is in now in possession of sufficient capital to improve and cultivate his land, and to enter advantageously upon a diversified, or any other system of farming. There is room in the state for hundreds of others to do the same thing.

Garden Profits.

It is well known that many snug fortunes have been made by market gardening in the vicinity of our large cities. True, there is much hard work involved in this business—much more than in wheat growing, chicken raising, or in fact any other branch of farming; but when followed with judgment and energy it never fails to realize a large profit. We have no facts at hand of California experience—our Californians are quite too negligent in the detailed records of the profits of business—so we must go abroad for evidence; and we have it at hand, as given in a late number of the *Hearth and Home*, drawn from the experience of a Mr. Henderson, a gardener at South Bergen, New Jersey, who makes the following showing as his average for 10 years, from ground kept at the highest standard of production:—

Outlay on an Acre.

Labor, man and horse.....	\$335
Manure (75 tons).....	100
Rent of land, \$30 per acre.....	40
Wear and tear of tools.....	10
Cost of marketing.....	100
Total.....	\$605

Receipts from same Acre.

12,000 early cabbages 5c. each.....	\$600
14,000 head of lettuce 1c. each.....	140
30,000 head celery 2c. each.....	600
Total.....	\$1,340
Deduct outlay.....	605
Net profit.....	\$735

If such a profit can be derived from land that is bound up by frost half the year, what ought to be done where one crop can succeed another almost or quite the year round, as can be done in many localities in California?

The difference in the price obtainable for the products here and there is more than an offset for the excess in the cost of labor and interest or rent here—to say nothing about the advantages of climate. The facts cited are well worth consideration, and will serve as a basis upon which to make estimates for similar or other productions here.

It is held by good judges that in the vicinity of New York a fortune can be made in a few years on land which costs \$2,000 per acre! It does not appear from the data at hand that market gardening is overdone anywhere in California, nor indeed in any other part of the Union, nor will it be until the present cost of most vegetables and fruits are much reduced.

BEET SUGAR FACTORY FOR SAN JOSE.—

An informal meeting of citizens of San Jose was held at the office of P. O. Minor, on Saturday, Dec. 10th, for the purpose of taking preliminary steps for the organization of a joint stock company for the manufacture of sugar from beets. A committee of five was appointed to visit the Alvarado Beet Sugar Manufactory, and acquaint themselves as far as possible with the process of sugar making, the cost, profits, etc., and to report at a subsequent meeting. The following gentlemen were appointed said Committee: Tyler Beach, W. C. Wilson, W. S. McMurtry, C. H. R. Page, J. J. Owen and A. L. Boggs. An adjourned meeting to hear the report of the Committee is to be held on the 19th inst.

LEMONS FROM ALAMEDA.—A very interesting and suggestive display of native lemons has been made, during the past week, at the store of Star & Little, in this city. The lemons—250 in number—were picked from a tree in Alameda county, belonging to Mr. Hale. They are of uniform size and fine appearance, much superior to any that have been received from Los Angeles, and the fruit bears a closer resemblance to the Sicily lemon than any other lemon raised in California. The tree, says the *Bulletin*, has a pleasant bit of history. It seems that Dr. Hale's father preserved the seeds of a lemon he eat, while crossing the Isthmus, some fifteen years ago, and shortly after his arrival here planted them. The tree sprung from one of those seeds.

DEMAND FOR FARMING LAND.—The Castroville *Argus* says that there never was a time when the demand for land was so great in the Salinas valley as at present. Hardly a day passes without parties applying to business men for information as to where land can be found to rent, and the prospects of that section was never better.

The above remarks may apply equally well to nearly or quite every agricultural county in the State.

SEED WHEAT FROM OREGON.—The last Oregon Steamer brought down ten tons of choice white wheat, which is being shipped to Chicago by railroad. This wheat is intended for seed.

Household Reading.

The Medical Properties of Vinegar.

The principal ingredient of vinegar, and that which gives it its strength, is acetic acid, of which strong vinegar contains about five per cent. In a pure state this acid is colorless, inflammable, volatile, exceedingly pungent, intensely sour and acid to the taste, and evaporates if exposed to the air. In experiments upon rabbits, it has been found that one ounce of acetic acid will kill a large healthy rabbit in seven minutes, and, on examining the intestines, they were found softened and highly inflamed. When applied to delicate, sensitive tissues in man, it is very irritating and almost a caustic. Galen was of the opinion that vinegar seriously injured the nervous system and impoverished the blood.

According to Margarin it occasions thickening of the walls of the stomach. Portal relates a case in the *London Medical Gazette*, of a young woman who was very stout and was advised to drink a small quantity of vinegar daily to reduce her size. It worked to a charm for this purpose, but in a month brought on cough, difficult breathing, fever, wasting away, and death by consumption.

German quacks are said to profess to cure obesity by means of daily doses of vinegar, and, if they sometimes fulfilled their promises, it was usually at the expense of their patient's lives. Suenderlin says that those who work in vinegar factories soon acquire a cachectic look and become consumptive. Orfila relates the case of a patient who swallowed a teaspoonful of acetic acid. He shrieked with pain, his mouth was whitened, there was a burning pain in the throat, chest and abdomen, profuse sweating, diarrhoea and vomiting occurred, and the pulse became small and quick. All these symptoms are those of poisoning.

All modern writers agree in this: that vinegar is to be avoided where the digestion is weak, or where there is a tendency to flatulence or diarrhoea. Chlorotic females are forbidden to use it, even though they long for it, and nursing mothers are advised to refrain from its use, as it often occasions fatal diarrhoea in infants by acidifying the milk, which otherwise would nourish. As an article of diet it is of doubtful utility, especially when other and better organic acids may be used in place of it, when acids are needful.

APPLES AND THE BLOOD.—The eating of fruit, and especially apples, has a tendency to purify the blood. If a person who is troubled with scrofulous humors eats freely of good, ripe fruit, after long abstinence from the same, he will be likely to be troubled with a "breaking out,"—the fruit will drive the humor from the system, causing it to pass off through the skin by means of pustules. People sometimes fear to eat fruit very freely from the fact that it causes such a breaking out. Such a result should not be considered unfavorable, but the reverse, and should be encouraged. A fruit diet, and free perspiration from moderate exercise, will do much to improve the health.

USE GOOD VINEGAR.—Dr. J. V. C. Smith says that the large amount of sulphuric acid employed in the manufacture of the spurious vinegar, now so much in use, has much to do with the early decay of teeth so generally prevalent at the present time.

GLOVES.—An English glovemaking has brought out a new glove with a pocket on the inside of the palm, to suit the habit indulged in by the fair sex of carrying money in that position. Flesh-colored gloves are the latest fashion. The advantage is that at a little distance no one notices that you have got them on.

HOUSEHOLD ECONOMY.—For cleaning furniture, removing blotches, and hiding scratches on furniture, nothing is better than coal oil mixed with a very small quantity of linseed oil. When your sewing machine is gummed up the best thing to loosen the dirt is clear coal oil. That will clean your machine thoroughly without either soap or water. When thus thoroughly cleansed oil the moving parts, as usual, with good machine oil, and your machine will be as good as new.

EXAMINE YOUR TEAPOTS.—A caution has lately been thrown out to the effect that cracked dishes, after being long used for holding gravies or fat of any kind, become unacid and unwholesome. And later comes another, with good medical authority to back it, against using tin vessels, more especially teapots, which have become rusted or blackened inside. The acid contained in the tea combines with the iron of the exposed portion of the vessel and forms a chemical compound not unlike ink. It corrodes and darkens the teeth, and cannot be inoffensive to the stomach. I have seen the discoloration, both of natural and artificial teeth, prove so obstinate from this cause as to require several scourings with soap and ashes to remove it.

The *Ohio Farmer* says that when housekeepers hear any of the family remarking "This tea tastes like ink," it is time to examine, possibly to throw away, the teapot. The most palatable and wholesome tea is made by steeping in a bright tin or porcelain cup, then pouring into a freshly-scalded earthen teapot. Thus treated it will never acquire the astringent quality so deleterious to the teeth and to health.

SOMETHING ABOUT FURS.—Sable, mink, astrachan, ermine, squirrel, grebe, black monkey and seal are perhaps the leading furs in the market. All fur goods are lower than last season. Mink has the general preference at the East. Astrachan and black monkey are worn in mourning; squirrel and grebe are chosen for children, as well as ermine. The latter is no longer so very expensive, but that most young ladies can now have a set. Seal skin grows steadily in popularity, and the jacket and sacques made of it are very elegant. Black silk sacques, lined and wadded, and bordered with fur, promise to be very popular, and are decidedly stylish. There is no very decided change in the shape of furs; the small pointed cape is retained, although boas or tippets have the preference. Such is the report of the latitude of New York.

CHINESE WAY OF COOKING TURTLES.—The Chinese are said to have a cruel method of cooking turtles, which is described as follows:—The turtle is placed in a vessel of water on the fire with a lid over it having an apparatus so arranged that the turtle can get his head out and within reach of highly spiced wine. As the temperature of the water increases so does his thirst, and he gradually goes on drinking the seasoned fluid till the heat kills him, by which time his whole system is impregnated with the vino-aromatic seasoning, and a flavor, described as delicious, imparted to the flesh.

CHEESE.—The Massachusetts *Ploughman* thinks the price of cheese must rise. It says the product of this country will fall short of the average on account of the drouth, and the product of England is probably at least a third below the average for the same reason, and that involves a deficiency of something like 60,000,000 of pounds there, while the vast armies of non-producers, and great consumers on the continent will eat up all that can be made there. We see no reason, therefore, why our shipments should not command advanced prices.

FRICTION MATCHES were introduced into Boston in 1836. In 1842 the principal manufacturer in that city was making about 15,000 a day, and was thought to be doing a very large business. That same person is now turning out about 15,000,000 a day, requiring about 30 cords of wood, upwards of two barrels of sulphur and 250 pounds of paper in which to put them up for market.

BEWARE OF BUSYBODIES.—A man who in any way meddles in other people's affairs is sure to make mischief. He generally meddles to serve himself, and consequently puts different constructions on the same things when said to different people, so that the most innocent words get distorted into applications which those who used them never intended they should bear.

TIGHT LACING.—A learned doctor has given his opinion that tight-lacing is a public benefit, inasmuch as it kills off all the foolish girls, and leaves the wise ones to grow into women.

HERONOTUS puts a sentiment into the mouth of a Persian soldier which must find an echo in many breasts, namely, that nothing is so annoying as to feel one's self full of wisdom and to find no one who will listen.

Household Receipts.

AN EXCELLENT LINIMENT may be made as follows: Take aqua ammonia, spirits of turpentine and sweet oil—equal parts. Shake the mixture thoroughly together; keep in a well corked bottle and in a cool place. Shake well before using. This will be found a most excellent liniment for use on both man or animals. It is good for pain in the back, for stiff neck, and for all strains, sprains or bruises. The best way to apply it is to sit by a fire and rub it in thoroughly with flannel. It is well to rub off finally with dry, warm flannel. This preparation is cheap, convenient, effective, and may readily be prepared by any person.

TOOTH POWDER.—Half an ounce powdered charcoal; one ounce powdered Peruvian bark; half an ounce prepared chalk; 20 drops of oil of lavender or neroli. These ingredients should be mixed in a mortar. This tooth powder possesses three essential virtues; it sweetens the breath, cleanses and purifies the teeth and preserves the enamel.

SORE MOUTH.—For sore mouth, either in human beings or animals, no application is equal to tannin, which should always be kept in the house for that purpose. A little of the powder sprinkled on the inflamed or sore spots, will cure almost immediately.

SUPERIOR TABLE MUSTARD.—Take best flour of mustard; fresh parsley, chervil, celery, tarragon, each $\frac{1}{2}$ oz. 6 salt anchovies;—garlic, if liked;—all well chopped and ground together; and grape juice and sugar to taste, with sufficient water to form the mass into a thin paste. When put into pots, a red-hot poker should be thrust into each, after filling, and a little should afterwards be poured upon the surface.

ANOTHER.—Take black mustard seed, quickly dried until friable, and then finely powdered, 1 lb.; salt 2 oz.; tarragon vinegar to mix. Other mustards may be prepared by employing differently flavored vinegars, or walnut or mushroom vinegar, or the liquors of sweet pickles.

STILL ANOTHER.—Take salt $1\frac{1}{2}$ lbs; scraped horse radish 1 lb.; garlic to suit; three or four cloves; boiling vinegar 2 gallons; macerate in a covered vessel for 24 hours, then strain and add ground mustard to liking.

PICKLED TOMATO.—Slice thin a peck of full-grown green tomatoes; pour over them vinegar enough to cover them, and add for each quart of vinegar an ounce each of the following spices (whole): Pepper, cloves, allspice, two ounces white mustard seed, and two onions chopped fine. Boil all together one minute, and set away to cool. In a week it will be ready for use.

Mechanical Hints.

CHINESE GOLD LACKER.—A German experimenter has lately discovered the method of producing the celebrated Chinese gold lacker, his imitations being entirely successful. His method of preparing this substance is to melt two parts of copal and one of shellac, so as to form a perfectly fluid mixture, and then add two parts of hot hoiled oil. The vessel is then to be removed from the fire and ten parts of oil of turpentine gradually added. To improve the color an addition is made of a solution in turpentine of gum gutta, for yellow, and dragon's blood for red. These are to be mixed in sufficient quantity to give the desired shade. The Chinese apparently use tin foil to form a ground, upon which the lacker varnish is laid.

CEMENT FOR SETTING STONES.—The following is a Turkish recipe for a cement to fasten diamonds and other precious stones to metallic surfaces, and which is said to be capable of strongly uniting surfaces of polished steel, even when exposed to moisture. It is as follows:—Dissolve five or six bits of gum mastic, each the size of a large pea, in as much spirits of wine as will suffice to render it liquid. In another vessel dissolve in brandy as muchisinglass, previously softened in water, as will make a 2oz. phial of strong glue, adding two small bits of gum ammoniac, which must be rubbed until dissolved. Then mix the whole with heat. Keep in a phial closely stoppered. When it is to be used set the phial in boiling water.

MARBLE of all kinds, alabaster and bard stone or glass may be readily repolished by rubbing it with linen cloth, dressed with oxide of tin—sold under the name of putty powder.

VARNISHED paint requires nothing but clean warm water, and to be wiped dry.

Life Thoughts.

The affections are but an exercise of the will of the soul.

A fool generally loses his estate before he finds his folly.

Action is life and health, repose is death and corruption.

It is nobler to be sincere than to wear the esutcheon of knighthood or to boast the blood of a line of kings.

PRINCIPLES believed will add fibre to the soul, but sentimentalism clogs the soul with dead matter.

As there are none so weak that we may venture to injure them with impunity; so there are none so low that they may not at some time be able to pay an obligation.

WHATEVER else you borrow, never borrow trouble. It never does any good, and when you return it you get no thanks.

EACH of us hears within himself a world unknown to his fellow-beings, and each may relate to himself a history resembling that of every one, yet like that of no one.

PATIENCE is always crowned with success. It may not be splendid success, but patience never takes anything in hand that it does not succeed with in some form or other.

Human Wet Blankets.

For one, writes Fanny Fern, the longer I live, the more I value health and cheerfulness. For pity's sake, let mothers, before they speak the final affirmative to a daughter's lover, see that he has both these priceless gifts. I remember a human wet blanket I used to stare at, with round eyes of wonder, when a child. A groan—sepulchral—marked his entrance, a groan his sitting down. A groan preceded the inquiry: "Well, isn't it a dreadful dull time in the church?" "No," answered Brother Hopeful; "there were two accessions last Sunday." "Well"—with another groan—"ten to one they will both huckle!" Now what call had this man to be the father of twelve children?—yet that was just his number. One would think, with such hearse-like views of life, he wouldn't take that liberal view of the census. Oh, give me the man who comes into his house with a free, joyous swing of his arm, snatches up the baby and eats it on his head, and kisses his wife as he hunts up the rest of "the bairns." I can tell a woman in any crowd who has this sort of a husband—God bless him! wherever he is. No son or daughter of his will be likely to roam in search of a pleasanter place than "our house."

Without an Enemy.

Heaven help the man who imagines that he can dodge enemies by trying to please everybody. If such an individual ever succeeded we should be glad of it—not that one should be going through the world trying to find beams to knock and thump his poor head against, disputing every man's opinion, fighting, and elbowing, and crowding all who differ with him. That, again, is another extreme. Other people have a right to their opinions; so have you. Don't fall in the error of supposing that they will respect you more for turning your coat every day to match the color of theirs. Wear your own colors in spite of either wind or weather, storms or sunshine. It costs the vacillating and irresolute ten times more to wind, and shuffle, and twist, than it does honest, manly independence to stand its ground.

KIND words are the brightest flowers of earth's existence; they make a very paradise of the humblest home that the world can show. Use them, and especially around the fireside circle. They are jewels beyond price, and more precious to heal the wounded heart, and make the weighed down spirit glad, than all the other blessings the world can give.

NOTHING on earth can smile but human beings. Gems may flash reflected light, but what is a diamond flash compared with an eye flash and mouth flash? A face that cannot smile is like a bud that cannot blossom, and dries up on the stalk. Laughter is day, and sobriety is night, and a smile is the twilight that hovers gently between both, and more bewitching than either.

LET US HELP ONE ANOTHER.—This little sentence should be written on every heart, stamped on every memory. It should be the golden rule practiced, not only in every household, but all through the world. By helping one another we not only remove thorns from the pathway, and anxiety from the mind, but we feel a sense of pleasure in our hearts, knowing we are doing a duty to a fellow creature.

Gold and Legal Tender Rates.

San Francisco, Thursday, Dec. 22, 1870.—Legal Tenders buying @90 3/4; selling @91. Gold in New York to-day 110 3/4.

The Date Paid to

By our subscribers is pasted on their wrappers, the last one or two figures represents the year. All are requested to send in the cash for a renewal of their subscriptions before their time expires. Don't wait to be benefited.

Greenbacks at Par!

Until February 1st, 1871, parties sending to this office direct for old or new subscription, *strictly in advance*, the sum of \$4 in currency, will receive credit for the PRESS, for one year. This will *not* apply to payments made otherwise than in advance, or to agents who have travelling expenses to pay and who save to subscribers the expense of remitting.

Send at Once!

Subscribers whose term for the PRESS expires with this volume will greatly oblige by remitting at once, before their names are taken from our printed list.

THE CLOSE OF OUR VOLUME occurs with this number. The next regular issue, No. 1 of Vol. XXII, will appear on January 7th, 1871.

There are 53 Saturdays in 1870, which occurrence happens once in seven years.

COLORADO SMELTING WORKS.—On Tuesday morning we paid the "Western Smelting Works" a visit, and found them in full blast and in comparatively successful operation. The ore, which is first reduced to about the size usually fed into stamp batteries, is roasted in a continuous kiln, and the concentrated sulphurets are prepared as a flux by being calcined in a furnace combining in part the principles of the Stetefeldt and reverberatory furnaces. The roasted ore and sulphurets are then charged into an upright or stack smelting furnace, together with pine wood charcoal, which seems to answer all purposes equally as well as the best hard wood or coal. The ores being treated were from the Running and Fisk lodes, always regarded as belonging to the most refractory class of ores in the country; but they seem to yield freely to this treatment, the slag flowing from the furnace in a free and continuous stream. The matt is drawn off at intervals of from four to six hours. The works were started on Monday, and were reducing ores at the rate from 8 to 10 tons in 24 hours. About 2 1/2 or 3 tons of matt had already been produced, which appeared to be of good quality. The above works are situated on North Clear Creek, just above Black Hawk, and are under the management of Messrs. Congdon & West. *Herald.*

Stewart's Quartz Mining Bill.

It is one of the most difficult matters imaginable to frame a law of this kind which shall satisfy the majority and secure the miner those rights of which he ought to enjoy undisputed possession. Our present law is acknowledged to be partial and insufficient, subject to being used for the injury of our mining interests; yet it is exceedingly hard to find a proper method of improving it. To criticize is easy enough; to suggest something better is extremely difficult. Mr. Stewart, of Nevada, introduced a new bill into the Senate, on the 9th inst., which will undoubtedly give rise to much discussion and criticism. Its main features are these: It grants patents for locations of a length of 200 feet, measured horizontally along the vein, and of a width of 600 feet, i. e. 300 feet on each side of the middle of the vein. All veins coming to the surface within this area, belong to the claimant, who can follow them to any depth, no matter where they may go, with the provision that his claim does not extend *lengthwise* beyond vertical planes carried down from the line of the ends of his location. Not more than 3,000 feet along the vein shall be included within one location in common by one association of persons. In addition, it gives the right to hold a surface location (not less than 40 acres nor more than 160 acres for each claim 200 feet long) for pasture, wood and water, machinery for mills, etc., and also reasonable sites for shafts, tunnels, hoisting works, mills, furnaces and the like.

If one could only know beforehand what sort of a deposit was struck by the prospector, we could have a law for different kinds of veins, which would give proper protection. As this is impossible, however, and the miner cannot wait to have his location examined and proved before having it secured to him, we must be content with an extremely general law. Square locations will have to be introduced in many cases, either for beds or for veins which have been worked to such an extent that much capital and room will be required. But a square location must be very large, and it is not probable that they could be introduced now. We are inclined to think that Mr. Stewart's bill is one of the best possible under our present circumstances; but we shall recur to the matter again, when we have space, in order to discuss the various kinds of veins and deposits—a thing which is necessary in order to be able to form a correct idea of what the requirements are for a law on the subject.

COAL.—The Humboldt *Register* has been shown a specimen of stone coal discovered near Argenta Station on the C. P. The specimen is of a bituminous character, resembling in a great measure the coal of Luzerne County, Pa., in the Wyoming coal district. The S. F. *Bulletin* states that the Bellingham Bay coal mines, situated in Washington Territory and in Puget Sound, have been sold to an English company. It is possible, it adds, although there is no authority yet for any definite statement to that effect, that the men who have hitherto controlled these mines may become interested in the new coal fields near Ogden. The statement with regard to the sale is denied.

THE MARYSVILLE WOOLEN FACTORY, situated on the corner of B and 2nd streets, Marysville, Yuba County, manufactures all kinds of blankets, cassimeres, doeskins, flannels, and every description of woollen goods, of an annual aggregate value of \$120,000. The machinery of this establishment is very complete, and is run by steam power. M. Diver is the Engineer, David E. Knight is Superintendent, and Hochstadter & Marcuse are the General Agents.

SONOMA R. R.—The last spike on the railroad between Santa Rosa and Petersburg was driven on the 11th.

Confidential.

In closing our year of fifty-two issues, we open our hearts and our mouths slightly, to confide a little of our plans to our readers. Our present volume is now complete, and in order to bring the commencement of the new volume within the new year, our subscribers will receive the next paper on the 7th of January, 1871. We must, therefore, take this opportunity of saying a few words. Our present number, we may remark, contains a larger amount of reading matter than usual, besides the index, which is of itself equal to several pages, at least to the compiler and compositor. We follow the usual course of journals in not issuing our paper next week (our subscribers having already received the full number of 52 issues), but we do more than is usual by making compensation by a larger amount of reading matter.

The PRESS has had a year of unsurpassed prosperity, notwithstanding that it has been the "dullest season ever experienced on the coast." Our circulation has been largely increased, even beyond our most sanguine expectations. More space has been devoted to our readers, subjects treated have been enlarged in number, and it has been our object to deserve our claim of being devoted to the interests of the coast. We reduced the price of subscription at the beginning of the year, yet have been able to publish a double sheet monthly, which was afterwards altered to two editions. We have been encouraged at every step, and substantially encouraged, too. With the next year we shall endeavor to do even better. Our present paper will be devoted more particularly to the interests of miners, mechanics, and inventors, the space devoted to advertisements will be more limited, in order that we may give more room for reading matter. This we are enabled to do by the publication of the PACIFIC RURAL PRESS, which, as its name indicates, will make farming its specialty. As, however, we believe that the miners should have some acquaintance with agriculture, we shall give in the SCIENTIFIC PRESS such information on the subject as will be applicable to the case.

All the other departments represented in the paper will receive equal and increased attention. We claim to be the leading journal of our class on the Pacific Slope, and we think we can fully substantiate our claim beyond doubt. We invite the co-operation of our readers in aiding us in our several departments, and promise to do our utmost to deserve their good-will and support. And with kind wishes to all, and the hope of mutual prosperity, we close our proprietorial confidential chat.

Industrial Education.

We are only displeased when our coast is the subject of indiscriminate flattery; but when we find a real and deserved compliment, we smile and quote. The Philadelphia *Jour. of Industry and Am. Engineer* gives San Francisco some genuine praise in the following paragraph:

From the San Francisco SCIENTIFIC PRESS we learn that in that city a branch of the Mechanic Arts College of the University of California, has been established for the instruction of those engaged in mechanical or other industrial pursuits. A series of lectures are to be given by the different Professors of the University, on such subjects as geology, chemistry, industrial mechanics, &c. A general invitation is extended to the citizens to attend, *free of charge*. * * * In this matter, we may take a lesson from San Francisco. If such results can be there attained, what ought not an Artisan's College if established on a proper basis, be able to accomplish here, amidst a population six-fold greater, and where the necessity for industrial education is equalled only by the means possessed for establishing a school or schools of the kind, which shall be unrivalled in completeness and efficiency.

On Hand.

We have already prepared a number of articles which will appear in the first issue next year. Among these may be mentioned articles on the transportation of ores to San Francisco and the erection of smelting works; on the mineral veins of the country with reference to Congressional action; the Quartz Mills of the Pacific Coast; the amounts of ores shipped to this city during the past year; the formation of gold nuggets, land matters, etc. Besides these, a series of articles on machine drilling for miners and on the determination of minerals by methods possible for the common miners, new smelting furnaces, etc., are being prepared by competent authorities. These are only a part of what we have already in hand or under way. We give this notice, because the amount of material which we now have, has been collecting faster than we have been able to publish it. The publication of the RURAL PRESS as a separate paper will enable us to devote more space to such subjects as the above and to kindred matters. A majority of these will be profusely illustrated.

Academy of Sciences.

Mastodon—Volcanoes—Channels.

The regular meeting was held last Monday, Dr. Blake presiding. Bones of a mastodon found about 12 to 15 feet below the surface, near Owen's river in Inyo county, were presented by Dr. Blake. A tooth, ribs, femur and other bones were given, and the doctor said he hoped to get a considerable portion of the animal. A beetle, with fungus growing on the head, and other specimens were contributed to the cabinet.

Dr. Le Plongeon read a continuation of his paper on earthquakes, taking into consideration more particularly the sub-division of volcanoes. These he contended were like boils on the skin,—local, circumscribed accidents. He attributed the heat of the earth to electro-magnetism and to chemical changes induced by electro-magnetism.

Prof. Davidson stated that in studying the formation of bars and channels at the entrances of the rivers and bays opening directly into the sea on the Pacific Coast, a law was developed showing that the channels all tended to the northward, directly against the northwest winds and northwest swell which rolls in steadily all summer. This had been found to be the case from the lower coast up to Vancouver. The cause of this he attributed to an eddy current running along the shore in a northerly direction at a rate varying up to 2 or 2 1/2 knots per hour. This rolls the sand on the bottom in a northerly direction, and thus the channels take this direction instead of a southerly one, as we should expect.

SMELTING AT SALT LAKE.—Messrs. W. Jennings & Co. have lately been experimenting in the smelting business, and for that purpose have erected, in the Fifteenth Ward, temporary smelting works, and, so far, their efforts have been crowned with gratifying success. Their first attempt was made with a quantity of ore from the "Hidden Treasure" mine, in East Cañon, owned by Messrs. Jennings & Lee, and the result was that some excellent pigs of clear lead and silver were cast. Those castings can be seen at the works, near Mr. Jennings' tannery. They have not been assayed but they indicate a large percentage of silver. Temporary works for experimenting in the manufacture of iron, from the native ore, are about to be erected also, by the same firm, by which the theory of making iron in Utah will be thoroughly tested and, as the members of the firm engaged in making the experiments are thoroughly up in the business, having had a long experience in the "old country," there is every reason to believe that their efforts will be as successful as they have been with other metals.—*Deseret News.*

THE MARL BEDS of Alabama extend over a belt of country nearly 100 miles in length.

Patents and Inventions.

Full List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS TO DEWEY & CO., U. S. AND FOREIGN PATENT AGENTS, AND PUBLISHERS OF THE SCIENTIFIC PRESS.)

FOR THE WEEK ENDING DECEMBER 6TH.

COMBINED LOCK AND LATCH.—Francis M. Ranous, Yreka City, Cal.
RAILWAY AXLE-BOX.—James Wardrobe, Charles D. B. Fisk, John F. Curtis, and George Fetley, Carlin, Nevada.
MEDICAL COMPOUND.—George C. Furber, Yreka, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible by telegraph or otherwise at the lowest rates. All patent business for Pacific coast inventors transacted with greater security and in much less time than by any other agency.

THE BLATCHLY ROCK-DRILL, now in operation at the Miner's Foundry, is the invention of Dr. A. Blatchly, of this city, who has been engaged in improving his device for the last four years. Having been occupied in the various branches of mining for 20 years, the inventor is familiar with all the requirements of such a machine, and he is confident that his drill will work more rapidly and cheaply than is possible with hand drilling. The machine is 30 inches long, 7 wide and 10 high, weighs 100 lbs. without the drill (which is put in after the machine is in position), and can be placed and operated by one man. There is no machine attached directly to it, and no engineer is required especially for it, while its operation is so simple that any one of ordinary ingenuity can learn to run it in a few days. It consists of less than twenty pieces, the principal ones being the driving-wheel and the harrel carrying the drill. This drill revolves once to twelve strokes, and its forward feed is regulated by the rapidity with which it cuts. For ordinary work, 300 blows are given per minute, cutting about three inches in granite, we are told. The speed can be increased to 600 blows. Any power can be used, either at the surface or down the mine. A patent for a method of transmitting power from the surface, so that any number of machines can be operated below at a small expense, has just been allowed the Doctor through the SCIENTIFIC PRESS Patent Agency.

A GOOD MOVE.—Mr. Sargent has introduced a bill into the house transferring the examination of swamp land claims from the office of the United States Surveyor-General of California to the local offices. The bill provides that it shall be required of the State Agent, who may claim such land in behalf of the State of California, to file an affidavit at the land office of the district in which the land is located, descriptive of the premises claimed, and availing from personal observation that, in his judgment, said premises are actually swamp or overflowed. Of course, adverse claimants will then appear, if there be any, and the trial will proceed before the Register. This will be of great benefit to settlers, who are now compelled to travel from the extreme portions of the State to attend upon a trial before the United States Surveyor in San Francisco.

MEDAL OF COLORADO COPPER.—The Central City Register, of the 7th, says: We were yesterday evening shown a large and beautiful copper medal struck at the Philadelphia Mint from Colorado copper. On its face was a view in relief of the Monier works in the Philadelphia mill in Nevada. Around the outer edge of the obverse side was the inscription, "The Monier Metallurgical Co. of Colorado," and within a milled circle, a quarter of an inch from the outer edge, is this inscription, "Struck from the first Copper Produced in Colorado, 1866." We presume these medals were struck and are retained by the stock holders as the only returns that enterprise ever made, with the anticipation that they will be the last.

ON THE INCREASE.—Messrs. Bandman, Nielson, & Co. inform us that the sale of Giant Powder, through their agency, now exceeds 20,000 pounds per month.

Modification of the Stetefeldt Furnace.

The Stetefeldt furnace has already been illustrated in our paper. But a modification of the method of firing has been introduced which, in many respects a simplification, and we therefore give another illustration.

The modification makes no change in the principle of the furnace. The first built was constructed for firing with wood. Then some changes were made and fire-places for charcoal and also gas-generators were introduced. As many, however, prefer the simpler arrangement for firing, and do not care to have the trouble of tending the gas-generators (which really demand only a small amount of attention), the present arrangement has been adopted. The cost of building has been materially reduced, and our readers can see how the construction has been simplified by comparing the present illustration with that given in the Press of December 11, 1869.

In the cut here given, A is the main shaft, BB are the lateral fireplaces, C is the door at the bottom of the shaft for discharging the roasted ore, DD are the doors

STETEFELDT FURNACE ARRANGED FOR BURNING WOOD.

for removing the ore from the bottom of escape-flue or auxiliary shaft, E is the escape-flue, F the escape-flue fire-place, G the dust-chamber, H the position of the feeding machinery, I the damper, and K the dust-chamber discharge door.

We hear but one opinion concerning this furnace, and that is a most favorable one. For roasting large amounts of ore we have no furnace which can compare with it. For oxidizing roasting, experiments have shown that the device works admirably, as it does for chloridizing, roasting. A furnace with a capacity of from fifteen to thirty tons of ore in twenty-four hours consumes from two to four cords of wood, or the equivalent in charcoal. Eight men only (two to feed, three to fire, and three to draw and cool the roasted ore) are required at the largest furnace in twenty-four hours. The ore has been chloridized up to 95 per cent., and with ordinary care, silver ore should never be chloridized below 90 per cent. The results obtained at the mills at Reno and Austin have demonstrated that there is, compared with reverberatory furnace, a saving in roasting the ore of fully \$12 per ton, a higher per centage of silver, and finer hullion.

In treating gold ores only a comparatively few experiments have been made, but these gave equally good results. Several lots of gold ore from the Gould & Curry mine at Virginia City were worked at the Reno mill, the gold and silver product of which averaged 85 per cent. Five tons of gold sulphurets from Meadow Lake, Nevada county, Cal., were worked at Reno and yielded 93 per cent of the gold and 92 per cent of the silver. The proportion of silver in the ore was very small.

Five furnaces are now in use in Nevada and a number of others have been undertaken. The first was erected at Reno, in October, 1869. It uses wood for fuel. The second was built at Austin, for the Manhattan Company, this spring. It has a capacity of thirty tons in twenty-four hours and uses charcoal. The third was built at Mineral Hill, Elko county, and uses charcoal. The fourth was built at the Monte Cristo mill, White Pine county, for working their "rebellious ores" (which it does successfully), and the fifth has just been completed at Belmont, Nye county, for working the ores from the Trausylvania mine.

The Stetefeldt Furnace Company have an agent in this city, Mr. B. J. Burns, who is to be found at Room No. 1, Duncan's Building, California street.

THE GALAXY.—This pleasant serial, always good, promises us even greater attractions than heretofore next year. Its corps of able contributors is to be enlarged, and we find on the list the names of some of our best writers. Of those most familiar to our western readers, we

Pacific Coast Directory.

H. G. Langley has just issued the second volume of this work, which is undeniably one of the most valuable publications of our coast. The first volume appeared in 1868, and so much care had evidently been taken in its preparation that it has since been a standard book of reference. We are glad to see this second volume which is still more comprehensive and valuable. It is intended to make this a triennial publication.

The mere statement of what is embraced in this volume would take up too much of our space. The work comprises 1,044 octavo pages, including 252 pages of advertisements. It abounds in material absolutely necessary for any one who desires any decent knowledge of the coast. We give the following extract from the preface to show something of the work done in getting up such a book.

The time and expenso of collecting the material for a work of the character of the Coast Directory, and the amount of careful, patient, and persistent labor necessary to prepare it for the press, can be scarcely realized by the uninitiated. In addition to a number of special canvassing agents, who visited every prominent locality in the territory embraced in the plan of the work, over nineteen thousand communications and blanks of various descriptions have been forwarded to the different Federal, State, County, and Municipal officers, and a numerous list of special correspondents engaged in developing the resources of the Pacific Coast. From these different sources a larger amount of material has been secured when its completeness is considered, than has been heretofore collected on the Pacific Coast.

CEMENTS.—We call the attention of families and miners, to the advertisement of the Giant Cement Co. They offer for sale two very useful and excellent articles, Giant Cement, and Miners Rubber Cement. The former is much used and approved of, for mending wood, porcelain, meerscham pipes, furniture, leather belting, or any article likely to be broken in a household. The Miners Rubber Cement supplies a want long felt by miners, and will save them much expense in repairing their rubber boots and clothing. It effectually cements patches on, and stops holes in rubber boots and hose, splices rubber belting, mends rubber clothing, etc. The cement is always ready for use, is easily applied, and is warranted perfectly waterproof. We recommend both cements as superior articles.

THE OMAHA COAL M. Co. will drill for coal 1,200 feet, if the citizens will contribute \$6,000 towards the expenses.

FORWARD! THE SCIENTIFIC PRESS. FOR 1871.

FORWARD!
 THE
SCIENTIFIC PRESS.
 FOR 1871.
 WILL BE SPECIALLY DEVOTED TO
 Mining, Mechanic Arts, Inventions, and
 Home Industries of the Pacific States.
PRINTED ON NEW TYPE,

AND ITS
READING COLUMNS INCREASED,
 AND
Otherwise Improved in Value.

The success of our improvements in 1870, and the reduction of our subscription rates to \$4 per annum, resulting in a large increase of subscriptions, has induced us to make the above announcement. To afford

EXTRA INDUCEMENTS
 To subscribers who will send in their names and cash for 1871, direct to the office previous to the commencement of the year we will, during this month of December only accept \$3.50 as full subscription for one year.

CLUBS AT \$3 PER ANNUM
 For each name, will be received when ten or more persons co-operate in sending us their cash in advance. Don't hesitate. Forward your own individual subscription. No one knows the real value of the Press until they read it. Use your copy of the paper to induce others to subscribe, (if you like it, yours-11), and in subsequent remittance for a club, we will allow you the difference first paid above club rates.

DEWEY & CO., Publishers.
 Dec. 5th, 1870.

THE CALIFORNIA ILLUSTRATED HOLIDAY JOURNAL is the title of a sheet just issued for the Christmas and New Year's Holidays, by Messrs. Wentworth and Boruck. It is made up of choice reading matter and illustrations appropriate to the season, and well worth reading and preserving. The gem of the issue is a poem entitled "Uncle Ben," written by Samuel Booth, an employé at the Mission Woolen Mills.

POULTRY RANCH FOR SALE.—Any one desirous of entering upon the poultry business, will find a good opportunity presented in our advertising columns to-day. The party now occupying is about leaving the city for a distant county, and offers his stand and stock for sale. The location, is within the city limits. The party leaving has had large experience in the business which would be freely imparted to the purchaser.

NEW POST OFFICES have been established at Gwin Mine, Calaveras county, (R. M. Redmond, P. M.); Rincon, San Bernardino county, (F. M. Slaughter, P. M.); Saucelito, Marin county, (John Schnell, P. M.); False Cape, Humboldt county, (Alonso Sweet, P. M.)

California Agricultural Notes.

TOMATOES AND GREEN CORN.—Tomatoes and even green corn were growing in the open air in Santa Clara County two weeks since, although it was well along in December. Some difference between our climate and that of the Eastern States, where snow lies on a level several feet in depth.

FARMERS in Scott Valley have advanced the price of wheat from 80 cents per bushel to \$1, and some even to \$1 25.

All the extra boats engaged in carrying grain on the Upper Sacramento and other rivers have been laid up for the season.

A THREE legged pig is one of the latest productions of Napa County.

WILD GESE are said to be found in extraordinary numbers about the marsh lands near the Bay between this city and San Jose.

Eastern Agricultural Notes.

THE GROWTH of winter wheat in some localities in Indiana has been so vigorous that farmers have turned their stock into the fields, to keep the wheat down sufficient to avoid injury from the coming cold weather.

THE MINNESOTA farmers were plowing their lands on the first day of December. The New Jersey farmers have been able to use the plow in every month of the present year.

FRUIT IN ARIZONA.—Apples are selling at Prescott, Arizona, at 75 cents per pound. There are quite a number of fruit trees in and about Prescott, which will come into bearing next year.

LARGE FRUIT EXHIBITIONS.—At a recent display of fruits in New York, W. S. Carpenter showed 250 varieties of apples, said to be the greatest number ever shown in the United States by any amateur. Ellwanger and Barry showed 180 varieties of pears.

WINE IN INDIANA.—The proprietor of a vineyard near Terre-Haute, Ind., has made 10,200 gallons of wine this season, and sent four tons of grapes to the markets of New York and Philadelphia.

DRAINAGE IN SCOTLAND.—Some idea of the importance attached to drainage in Scotland may be inferred from the fact that on one farm there which does not exceed 500 acres there were over 400 miles of drains several years ago, and the work was not then regarded as complete.

DETERIORATION IN GUANO.—There is said to be a remarkable falling off in the quality of recently imported Peruvian guano. It contains much rock or sand. The supply on the Chincha Islands is probably running rather short. The British farmer is terribly imposed upon in the article of commercial manures.

A SPRINGFIELD, Ill., man paid \$600 for a Berkshire boar and two sows, recently imported.

A FARMER in Mantonsville, Minn., has harvested 45 acres of timothy seed, yielding seven bushels to the acre, which he has sold at \$4.50 per bushel.

THE NEW YORK MILK SUPPLY.—Into the city of New York there flow five great streams of milk each day. One over the Harlem road, another over the Erie, another over the New Haven, another by the Hudson, and yet another by the Long Island, amounting to \$25,000 worth daily, besides that which comes in by numerous small rivulets.

THE CRANBERRY CROP the past season is said to have been unusually large. A single county (Ocean) in New Jersey, has turned out 65,000 bushels, for which buyers were paying about \$3.25 per bushel.

SHEEP IN THE SNOW.—The Brown brothers, ranching near Smartsville, have pastured 1600 sheep the past summer on Fall creek. About the first of November, fearful of being caught in a snow storm, they drove their flock down to the Six Mile House above this city. This morning they started them down for Smartsville. The snow at the Six Mile House was 18 inches deep and they had to break a narrow track, and placing the sheep in single file managed to get all but about twenty out, and they passed through town this afternoon; the drove in single file while coming down the ridge above the city was over a mile in length. The flock appeared in good condition, the result of good pasturage in the mountains.—Nevada Gazette.

PHOTOGRAPHY.—For Cabinet Photographs, or Enamelled Cards, of the very best quality, you must go to the NEW YORK GALLERY, Nos. 25 and 27 Third street, San Francisco. Every picture warranted to give satisfaction. 0v13-6m B. F. HOWLAND.

BLOCK TIN AND SOLDER WIRE, broom wire, piano covering wire, etc., manufactured by Joshua Gray, 437 Brannan street. 24v19-3m

SUCCESS IN BUSINESS.—Success in the business world usually depend upon being thoroughly prepared for its duties. Young men! if you would succeed in your business career, secure a good practical business education. This question being settled, the next is where to go. Why, go to the best, of course. Go to HEALD'S BUSINESS COLLEGE, located in the new College Building, 34, Post Street, San Francisco. This is the only school upon the Pacific coast where young men can depend upon being thoroughly fitted for Bankers, Merchants, Clerks, and Book Keepers. This school is connected with the "International Business College Association" or Bryant & Stratton chain. Its scholarships are good for tuition in any of the forty colleges, located in all the leading commercial cities of the United States and Canada. There are many interesting features about the school which can not be discussed here. Call at the College and examine its workings. If unable send for circulars and HEALD'S COLLEGE JOURNAL, which will be sent free upon application. Address, E. P. HEALD, President, Business College, San Francisco, Cal. 23v22-3m3n

MARAVILLA COCOA.—For Breakfast.—The Globe says: "Various importers and manufacturers have attempted to attain a reputation for their prepared Cocoas, but we doubt whether any thorough success has been achieved until Messrs. Taylor Brothers discovered the extraordinary qualities of 'Maravilla' Cocoa. Adapting their perfect system of preparation to this finest of all species of the Theobroma they have produced an article which supercedes every other Cocoa in the market. Entire solubility, a delicate aroma, and a rare concentration of the purest elements of nutrition, distinguish the 'Maravilla' Cocoa above all others. For constipations and invalids we could not recommend a more agreeable or valuable beverage." Sold in packets only by all Grocers, of whom also may be had Taylor Brothers Original Homoeopathic Cocoa and Soluble Chocolate. Steam Mills—Brick Lane, London. 5v20-1y

THE ASPHALTUM PRESSURE PIPE COMPANY,

HAVING ERRECTED A MANUFACTORY of sufficient capacity to supply their Asphaltum Pipe in large quantities.

Are now Prepared to Take Orders
AND MAKE CONTRACTS.

This Company will manufacture Pipe and guarantee it to stand any pressure required; its lighter than iron pipe and more durable, it is not affected by chemical action, cannot corrode, and being glazed imparts no disagreeable taste to water. To miners and farmers it is invaluable; any body can put it down; it is twenty per cent cheaper than iron pipe and ten times more durable. For further particulars, apply at the office of the Company, Room No. 2, 645 Market street. 15v21-tf

NOTICE.

THE undersigned having completed arrangements through one of the first "Promoters" in Europe, for placing CALIFORNIA MINING SECURITIES ON THE LONDON MARKET, is now able to offer superior facilities for disposing of reliable mines of gold, silver or other minerals, as above stated. All properties given in my charge will be placed direct, without loss of time, upon the London Market, through a perfectly reliable party, long resident and entirely familiar with the business. Every advantage offered to parties owning shares in American mines worked by English capital, to dispose of the same. Advances made and ample security given when required.

The California Powder Works

No. 314 CALIFORNIA STREET,

SAN FRANCISCO.

Manufacturers and have constantly on hand

SPORTING,

MINING,

And BLASTING

POWDER,

OF SUPERIOR QUALITY, FRESH FROM THE
MILLS. It being constantly received and transported into
the interior, is delivered to the consumer within a
few days of the time of its manufacture, and is in every
way superior to any other Powder in Market.
We have been awarded successively

Three Gold Medals

By the MECHANICS' INSTITUTE and the STATE AGRI-
CULTURAL SOCIETY for the superiority of our
products over all others.
We also call attention to our

HERCULES POWDER,

Which combines all the force of other strong explosives
now in use, and the lifting force of the most BLASTING
POWDER, thus making it vastly superior to any other
compound now in use.
A circular containing a full description of this Powder
can be obtained on application to our Office.

BILLIARDS.

MESSRS. PHELAN & COLLENDER,

The well-known Billiard Table Manufacturers of New

York, have established at 541 Market street, this city an

extensive branch of their business, where they propose to

keep constantly on hand the largest and most complete

assortment of Billiard Tables, Cloth, Cues, etc.,

on this coast. The Tables are of the latest styles and

size recently adopted in the Eastern States, are man-

ufactured in the best possible manner, and furnished

with Phelan's latest improved Cushions. All goods sold

will be of the best quality, and the prices fully as low

as any other house in the business. The public are in-

vited to visit our warehouses and inspect our stock.

15v2 3m GEORGE F. PHELAN.

Fruit and Ornamental

TREES.

We offer this Season, 1870 and 1871.

A very large and superior stock of trees, etc., of best se-

lected varieties of everything usually produced in well

kept nurseries. Our trees are grown on good alluvial

soil, and are unsurpassed for thrifty growth of root and

stock, and are suitable as to name on labels. Orders re-

ceived by Mail or Express, will be strictly attended to,

and PACKING done so as to INSURE A SAFE TRANSIT

to any distance.

Dealers and Agents allowed favorable terms.

Priced Catalogues furnished on application.

would unsettle the titles to more than three million acres of land, and take away the vested rights of thousands of men. More than a thousand swamp land locations have been made in the single district lying mostly in the country of Yolo. Some of these locations have been subdivided and sold in five, ten, and twenty acre tracts, and the effects of this bill would come home to some thousands of men, women and children in this district alone.

There are one hundred and eight reclamation districts in the State, and in some counties, more swamp land locations than in Yolo. The purchase money paid to the State—one dollar per acre—is applied to the work of reclamation. The \$3,000,000 so applied, would be transferred by this bill to the coffers of the General Government. More than this, the minimum price of public lands is one and one-fourth dollars per acre, but much of the swamp land lies within the limits of railroad grants, and would therefore become double minimum lands, held by the Government at two dollars and a half per acre. The odd sections falling to the railroad companies might be sold at a higher or lower rate. Instead of \$3,000,000 applied to reclamation, and retained in the State, Julian would have \$3,750,000, paid over to the General Government, a drain upon our resources that in these hard times would be felt. Lands, easily reclaimable, were long since purchased, levied and occupied. Recently a few large tracts in the bed of the tules have been located by companies, who hope by the expenditure of large sums of money to render them susceptible of cultivation. It is thought by many that they will not succeed.

It is my purpose to claim no special wisdom or disinterestedness on the part of our late Surveyor-General. The complication of State land titles which had been accumulating for years, culminated during his incumbency and compelled his attention. During almost his entire second term, the office was besieged by men clamorous to know what the State was going to do in protection of their rights. It became his duty to solve that problem. Granted leave of absence by the Legislature, he went to Washington in 1866, and drafted a bill which with some modifications became the law under which nine-tenths of all the land yet transferred to the State, have been listed. It meets nearly all, perhaps all the requirements and equities of the case, and under its operation the conflict of titles is fast disappearing. The principal difficulty experienced by General Houghton in passing this bill, arose from the failure on the part of Julian to interpolate a provision repugnant to the sense of justice of the entire delegation from the Pacific Coast. He now comes forward with a bill repugnant to the moral sense of all who understand its bearing upon the rights and interests of this State and people.

A. B. BOWERS.
Sacramento, December 20th, 1870.

ASBESTOS.—A mine of this mineral is situated 1 1/4 miles from Fur Top, Eureka, Sierra County, on the east side of Chapparral Hill, and is said to be very extensive. It is owned by V. C. McMurray and E. B. Covey, of Camptonville.

GRAND YOSEMITE ENTERPRISE.—The Mariposa Gazette says that there is a grand scheme afloat for promoting travel to the Yosemite. The plan is to organize a joint stock company to make contracts with transportation companies throughout the U. S., and to issue through tickets to the Valley from all parts of the Union.

SCIENTIFIC PRESS.—This paper comes to us this week with a full double sheet extra. It contains a full map of California, a map of the San Joaquin valley, with a brief description and statement of the productions of each county, besides the usual mining, agricultural and scientific intelligence. It is a paper that should be in the hands of every farmer, miner and manufacturer on his coast.—*Nov. Transcript.*

FROM A READER.—Duncan's Mill, Sonoma Co., Oct. 10, 1870.—Messrs Dewey & Co: Don't stop my paper. Your journal is very valuable. No better investment for \$4.

GIANT CEMENT.

A most extraordinary and universally needed article for mending Furniture, Crockery, Glassware, Marble, Meerschaum Pipes, Ornaments, etc.; also splicing Leather Belting and patching Boots and Shoes. This Cement possesses extraordinary merit, and is in every way a first-class article. Every can is its own testimonial. Also, BREXEN'S RUBBER CEMENT, for mending Rubber Boots, Shoes, Belting, Coats, and Hose without stitching! Easily applied, never failing, and perfectly waterproof. Both Cements are put up in TIN CANS ONLY, with full directions. Take no other. GIANT CEMENT and MINERS' RUBBER CEMENT are kept by Druggists and Dealers throughout the country. Country Dealers can be supplied by ordering from any house here or in Sacramento with whom they deal, or by sending direct to us. Send for Agents' Circulars and Price List to Giant Cement Manufacturing Co., 419 Washington street, San Francisco.

MINERS' RUBBER CEMENT.

Providence Gold and Silver Mining Company.—Location of Works, Nevada County, California.

IMPORTANT BOOK!

JUST ISSUED.—Roasting of Gold and Silver Ores, and the Extraction of their Respective Metals without Quicksilver. By G. Kustel, Mining Engineer and Metallurgist; Author of "Nevada and California Processes of Silver and Gold Extraction," and "Concentration of all Kinds of Ore." Illustrated by numerous engravings. Published and sold by Dewey & Co., proprietors SCIENTIFIC PRESS, San Francisco.

This Book contains 120 pages. Price, \$2.50, gold, or \$3 currency, postage paid.

PORTLAND, OREGON, Nov. 24th, 1870.—Dewey & Co.,—Gentlemen,—It is Thanksgiving to day, and I think it is my duty to write you a letter of thankfulness, for the friendship and business-like manner in which you have attended to my business. Your inventions illustrated by valuable models, which I place in your hands, together requiring years of hard study, have been protected by valuable patents through your agency.
Dewey & Co., are the only Patent Agents that I shall ever employ to obtain Letters Patent for me so long as I live, and I thank you sincerely for your honorable duties to me. I shall soon place four more cases in your hands for prosecution. Again thanking you, I remain,
Yours &c., THOMAS HILL.

SOZONOT.—All dentifrices had their drawbacks, until the salubrious Bark of the Soap Tree was brought from the Chilian valleys, to perfect the fragrant SOZONOT, the most wholesome, reliable and delightful article for the Teeth that a brush was ever dipped into.

THE MASONIC MIRROR

Is the only Masonic Publication on the Pacific Coast. The Second Volume is published weekly, in the popular and beautiful form of a

QUARTO-MEDIUM SIXTEEN PAGE PAPER

AND IS A FIRST CLASS
Literary and Family Newspaper,
AS WELL AS THE
Organ of the Masonic Fraternity on the Pacific Coast.

ENDORSEMENT OF THE GRAND LODGE.

The following resolution was unanimously adopted by the M. W. Grand Lodge, F. & A. M., of the State of California, at its Annual Communication, October, 1870. Whereas, In the opinion of this Grand Lodge, a well conducted Masonic Journal is of great benefit to the craft, in disseminating Masonic information among the fraternity, as well as furnishing a medium for general Masonic intelligence. Therefore,
Resolved, That this Grand Lodge, recognizing in the Masonic Mirror, edited by Brothers Amasa W. Bishop and Edwin A. Sherman, and published by the Masonic Publishing Company of San Francisco, a Masonic Journal of the character above set forth, do hereby recommend the said Masonic Mirror to the craft generally, as worthy of their most favorable consideration and support.

ENDORSEMENT OF THE GRAND CONSISTORY.

At the communication of the M. P. P. Grand Consistory, Ancient and Accepted Scottish Rite of Freemasonry in and for the State of California, held October, 1870 at San Francisco, the following resolution was unanimously adopted: Resolved, That the Masonic Mirror, published in this city be the official organ of this Grand Consistory.

TO ADVERTISERS.

The Mirror presents the best Advertising medium on the Pacific Coast, as it circulates in every town and hamlet, and among a class of citizens that it will be of advantage to advertisers to reach.

THE CHEAPEST Agricultural and Horticultural Journal In the United States.

The Journal of the Farm,
16 Large Octavo Pages,
HANDSOMELY ILLUSTRATED,
Price one Dollar a Year.
CLUBS OF 20 - - - - - FIFTY CENTS.

ADVERTISERS
Are informed that its circulation is larger than that of any other paper of its class published in the state of Pennsylvania.

JOURNAL OF THE FARM.
20 S. Delaware Avenue, Philadelphia, or
230 S Water Street, Chicago.

To Amateur Printers:

We have for sale in the Press office, one of Lowe's cheap hand Presses, which we will sell for \$25, one half cash down, and the balance to be paid in good order. A handy article for a country office, which has no small job press.

TO MINERS, MILLMEN AND METALLURGISTS.
Kustel's new work on the Concentration of all kinds of Ores, and the Chlorination Process, for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, is the best and most complete work issued. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. Price, \$7.50, postage paid. Published by Dewey & Co., publishers of the Scientific Press, San Francisco.

FROM G. F. J. COLBURN, of Dental Surgery, Newark, N. J.—The popular dentifrice known as SOZONOT, besides being a very pleasant addition to the toilet, contains ingredients, that if used according to the directions, will prove of the greatest utility to the health of the mouth and teeth.

"SPALDING'S GLUE," with Brush, ready for use.

THE PRESS is just such a journal as the people of this valley should patronize—it ought to go to every fireside. It is devoted to the agricultural and mining interests, mechanic arts and general industrial progress. The subscription price is \$4, which, considering that the PRESS is one of the largest and ablest journals of its class in the Union, we consider very reasonable.—Every business man of Bozeman, will be satisfied, give Mr. Murray his name, and we hope much of our country friends as he interviews will be equally liberal. PICK & FLOW, MONTANA.

SCIENTIFIC PRESS—three numbers—terms \$4 per annum—San Francisco. Constant improvements are being made in this publication. Illustrated mechanics receive liberal attention. Of late, an edition exclusively devoted to agricultural matters is issued simultaneously with that devoted to mining and scientific affairs generally. The growth of the paper and multiplicity of subjects embraced in the table of contents give evidence of an increased patronage and corresponding industry to maintain its high character.—*Colorado Herald.*

MILLER & HALEY'S MILLS,
BERRY STREET,
Between Third and Fourth Streets, S. F.

Having been burned out at the late fire on Fremont street, we have removed our business to the above locality, where the manufacture of sash blinds, doors, frames, mouldings, etc., in connection with a general mill business, will be carried on by us as formerly, and where we shall be pleased to see all of our old friends and patrons, and as many new ones as may favor us with a call.
Thankful for past favors, and especially for the sympathy extended to us for our late heavy losses, we intend, as heretofore, to deserve the patronage of the public by strict attention to business, fair dealings, and justice to our customers.

Miners, Look to Your Interests!**SAVE EXPENSE.**

Use the most economical working machinery for crushing your ores.

The Wilson Patent STEAM STAMP MILL

IS AN

IMMENSE SUCCESS.

NO MINER STUDYING HIS INTERESTS WILL USE ANY OTHER MILL.

It costs a great deal less than any other mill and does its work for from twenty-five to fifty per cent. less expense.

The Wilson Steam Stamp Mill CRUSHES ONE TON PER HOUR

OF THE

HARDEST QUARTZ,

THROUGH THE ORDINARY SCREENS.
One of these mills now being used as custom mill,

AVERAGED,

On Rock from Twenty-two Mines,

Twenty-eight Tons Per Day.

It uses about three cords of wood for twenty-four hours.

Is all complete when it leaves the shop, and weighs about 6,500 pounds, and can be put in operation in one week after it reaches the mines.

THE COST

of this mill all complete, including boiler, pump, setting and everything in complete running order at the mine is

NOT OVER ONE HALF**THE EQUIVALENT****OF ANY OTHER MILL.**

These mills have now been in practical operation for nearly three years, and have proved in point of

Durability, Economy and Efficiency,

TO HAVE

NO EQUAL.

It requires no skill to run them and any one of ordinary abilities can set them up. The success of these mills having been so unprecedented that we now

GUARANTEE THEM

to be all that we claim for them and guarantee all repairs for twelve months.

One of these Mills can be seen at the Pacific Iron Works.

THE WILSON Patent Steam Stamp Mill.

This extraordinary Mill, now so justly popular in the East, is now offered to the miners of the Pacific Coast. Having been in operation now for about two and a half years, the Company feel confident that the

WILSON STEAM STAMP MILL, For Durability, Efficiency, AND ECONOMY OF WORKING, HAS NO EQUAL.

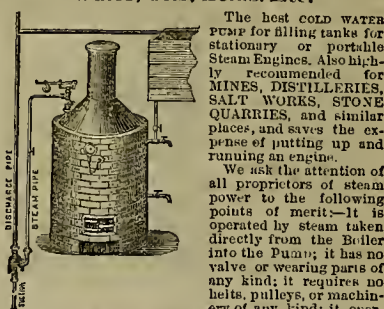

The Wilson Steam Stamp Mill is the only Steam Mill that has had the severe ordeal of practical working, and proved itself eminently successful. It is now in operation in several of the Eastern States and Territories, and gaining an enviable popularity. The whole machine is so simple as to be readily understood by the most ordinary minds. In fact, its simplicity is its durability. The expense of crushing rock or cement with this Mill is less than one-half the expense of any other Stamp Mill, and less than one-half the cost. For further particulars inquire of

FURMAN R. WILSON,
San Francisco.
Or of THE WILSON STEAM STAMP MILL CO., 326 Walnut street, Philadelphia, Pa.

NOTICE.—All persons are hereby warned not to manufacture or use any Steam Stamp Mills that are an infringement on the Wilson Patents, as they will be prosecuted to the utmost rigor of the law.
F. R. WILSON,
20v19-1f Supt. W. P. S. S. M. Co., Philadelphia.

STEAM JET PUMP.

Blakeslee & Williams' Patent, for Water, Oils, Acids, Etc.

The best cold water pump for filling tanks for stationary or portable Steam Engines. Also highly recommended for MINES, DISTILLERIES, SALT WORKS, STONE QUARRIES, and similar places, and saves the expense of putting up and running an engine.

We ask the attention of all proprietors of steam power to the following points of merit—It is operated by steam taken directly from the boiler into the Pump; it has no valve or wearing parts of any kind; it requires no belts, pulleys, or machinery of any kind; it operates entirely independent of an engine; it will not choke up with foul water; it costs much less to put up and start; it will not wear out in a lifetime, or require repairs; it is reliable, and certain to work at all times; it is not liable to injury from freezing.

Send for Circular. PARKER & HUNT, Southeast cor. Tenth & K Streets, Sacramento City Cal.

AGENTS—CHAS. F. BROCK, 117 California St., San Francisco; KEPP & BARTON, Stockton. 21v21-1f

Varney's Patent Amalgamator.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be spared, to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill-men are invited to examine these pans and settlers for themselves, at the office, 229 Fremont Street, San Francisco.

TO PACIFIC COAST INVENTORS.

Having had large experience, and gratifying success with the great variety of cases emanating on this coast, we feel confident of our abilities to assist inventors in patenting their inventions, saving them from vexatious delays, and from receiving worthless papers by reason of imperfect preparation of their claims before being sent to the Patent Office.

In early days but little preparation was needed, but now, by reason of the multiplicity of inventions, and the numerous Acts of Congress, found necessary to protect the inventor while the patent lasts, and to do justice to the people after it expires, the utmost care and skill are requisite in managing cases and obtaining a patent that will be of real value to the Patentee, and stand the test of passing through the legal ordeal of an infringement suit.

The general practice of the Patent Office regarding the examination or issue of Letters Patent for inventions has not been materially changed for many years, yet there have been amendments added to the laws of 1861, 1863, and 1866, and which it is necessary for all parties managing an application to be conversant with. Old inventors invariably advise the employment of none but agents of responsibility and experience. As agents with such qualifications, we solicit honest patronage.

Saving of Time.

In urgent cases for an immediate patent, persons can deposit the amount of the last fees with us, in San Francisco, and have our Washington agent procure the issue of the papers as soon as granted, saving at least several weeks time which would otherwise be required for the inventor to receive notice and then forward the money. Money advanced for this purpose will be returned, should the application be rejected. By adopting this course, we are enabled, with our other advantages, to secure the receipt of patent papers to inventors on this Coast several months sooner than can generally be done, through agents in the East, without the applicant going to the risk and expense of sending on the last fee before it is known whether the patent will be granted.

Dangers of Delay.

Situated so remote from the seat of Government, delays are even more dangerous to the inventors of the Pacific coast than to applicants in the Eastern States. Valuable patents may be lost by the extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor, or by reason of return for amendment when addressed directly by the inventor to the Government.

Expense of Applying for Patent.

The Government fee, on filing an application for a patent in the United States, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded.

To the foregoing official fees must be added fees for preparing the various documents and expense of drawings. Our charge for preparing the documents for a case, presenting it to the Government, and attending to all business connected with it, is \$25 and upward. For cases demanding extra work and attention, only a reasonable fee in accordance with the services required, to do full justice to the case, will be charged.

Following is the list of Government fees, payable in currency:

On every caveat.....	\$10
On every application for a patent, for seventeen years.....	15
On every application for a design, for 3 yrs and 6 mos.....	10
On every application for a design, for fourteen years.....	30
On issuing each original patent.....	50
On filing a disclaimer.....	10
On every application for a re-issue.....	30
On every additional patent granted on a re-issue.....	30
On every application for an extension.....	50
On the grant of every extension.....	50
On appeal to the Examiners-in-Chief.....	10
On appeal to the Commissioner from Examiners-in-Chief.....	20
On every appeal to the Judges of Circuit Court, U. S. C.....	25

Inventors on the Pacific Coast, located at great distance from the Patent Office, of all others,

should be careful to avoid inexperienced, dishonest, or otherwise unreliable and irresponsible agents. Inventors having models in our possession must send written orders when they desire any particular friend to see them.

Advancing Cases.

If any case placed in our hands meets with rejection, we do not wait to write and inform the inventor of this fact, (as is the case with most agents,) but our representative at Washington proceeds at once to examine the stated objections, and if it be not a just and unavoidable decision, the claims of the inventor will be persistently argued before the Examiner, and if possible the decision reversed.

By Telegraph.

In cases of immediate importance we can have their progress reported by telegraph, so that applicants know immediately the result of the examination and decision of the Patent Office. We also make examinations by telegraph regarding the patentability of inventions; examine patent assignments on record at Washington; obtain copies of patents or claims, and also derive other information desired instantly from the Patent Office.

DEWEY & CO.,

Publishers and Patent Agents, Scientific Press Office, San Francisco.

The Best Treatise Published.**Concentration of Ores**

(OF ALL KINDS,) INCLUDING THE

CHLORINATION PROCESS

FOR GOLD-BEARING SULPHURETS, ARSENIURETS, AND GOLD AND SILVER ORES GENERALLY.

By GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Author of "Nevada and California Process of Silver and Gold Extraction."

With 120 Lithographic Diagrams.

Published and sold by DEWEY & CO., Publishers SCIENTIFIC PRESS, San Francisco, 1868.

Heads of Table of Contents.

- I. INTRODUCTION.—The Dressing; The Separation; Cleansing and sizing Contrivances; Rotary Sizers, etc.
- II. REDUCTION.—Reduction of Ores; Description of Batteries; Details of a Battery; Speed, Curve and Order of Lifts; The Discharge of Batteries; The Feeding of Batteries; Reduction by Rolling Mills; Grinding; Pans with Plane Mullers; Pans with Conical Mullers; Pans with Tractory-Conical Mullers; Pans with Perpendicular Mullers.
- III. CONCENTRATION.—Concentration of Reduced Ore; A Concentration of Ore Grains, (Jigging Stuff; Movable Jiggers; Stationary Jiggers; Continual Jiggers; Rotary Machines; Concentration of Ore Sands; Assorting of Sands; Feeding of Concentrator; Stationary Concentrators; Percussion Tables; Oscillating and Shaking Tables; Steady Moving Concentrators.
- IV. SPECIAL CONCENTRATION.—Concentration of Gold Ores; Concentration of silver Ores; Concentration of Lead and other Ores.
- V. CHLORINATION.—Extraction of Gold from Sulphurets by chlorination; Assay ditto; Loss of Gold in Roasting; Roasting Furnaces and Operation; Roasting with Salt; Dumping of Roasted ores; Sifting; Production of Chlorine Gas; Lixivation; Precipitating Vat; Precipitation; cost of Process; Remarks; Other methods of Dissolving and Precipitating this Gold from Sulphurets, etc.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers. Containing as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order.

Price, postage paid, \$7.50, in gold or its equivalent.

And in accordance with law, and an order of the Board of Trustees, made on the 12th day of November 1870, so many shares of each parcel of said Stock as may be necessary, will be sold at the office of the Company, by the Secretary, 37 New Merchants Exchange, San Francisco, on the 15th day of January, 1871, at the hour of 12 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale. J. M. BUFFINGTON, Secretary, Office 37 New Merchants Exchange, (third floor) San Francisco, California. dec25

Nevada Land and Mining Company.—Location of Works, Johnson & Latham Antelope and Clifton District, Elko County, State of Nevada.

NOTICE.—There are delinquent, upon the following described Stock, on account of Assessment levied on the sixteenth day of November, 1870, the several amounts set opposite the names of the respective Shareholders as follows:

Names	No. Certificates	No. Shares	Amount
Henry R. Miller.....(unissued)	2000		80 00

And in accordance with law, and an order of the Board of Trustees, made on the sixteenth day of November, 1870, so many shares of each parcel of said Stock as may be necessary, will be sold at public auction, at the office of the Company Room 5 No. 302 Montgomery street, San Francisco, Cal, on Saturday the 7th day of January 1871, at the hour of 1 o'clock P. M. of said day, to pay said delinquent Assessment thereon together with costs of advertising and expenses of a sale. WM. H. WATSON, Secretary, Office, Room 5 No. 302 Montgomery St., San Francisco.

St. Patrick Gold Mining Company.—Location of works, Ophir District, Placer County, Cal.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 27th day of December, 1870, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the office of the Company No. 402 Montgomery street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the first day of February 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the 20th day of February, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees,

T. F. CRONISE, Secretary, Jan 7 Office, No. 402 Montgomery st., San Francisco.

Washington Mining Company.—Location of Works and Mine, Mariposa county, State of California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the 12th day of December 1870, an assessment of \$1 per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary at the office of the Company, No. 266 Front street, San Francisco.

Any stock upon which assessment shall remain unpaid on the 15th day of January 1871, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday the 6th day of February, 1871, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees

T. B. WINGARD, Secretary, Office, 266, Front street, San Francisco, California.

SALT LAKE CITY Oct. 11, 1870.—Messrs. Dewey & Co.—I wouldn't care or the missing number of the SCIENTIFIC PRESS particularly if I did not keep them on file. I think a great deal of it and consider it worth keeping. I never invested four dollars to better advantage in my life. Respectly Yrs. A. O. B.

TAKE THE NEW HOME PAPER!

[From our Sample Issue, Dec. 17, 1870.]

THE PACIFIC RURAL PRESS.

In presenting to our readers the preliminary or sample number of the **PACIFIC RURAL PRESS**, we do not claim that it is what it should be, by any means; but the efforts of the publishers in conducting and building up the **SCIENTIFIC PRESS**, is efficient guarantee that no efforts will be spared to elevate their new paper, as fast as circumstances will permit, to such a standard of excellence and usefulness as will make it worthy and fit to represent the great and growing agricultural interest of the Pacific Coast. All we ask is the prompt and hearty co-operation of our friends in extending to it such a support as will warrant the necessary outlay to make the paper what it should be. Being already provided with an able corps of writers and workers in every department, a well equipped office, and a reputation for integrity and energy, which has been accorded by a generous public and which has proved of the highest pecuniary value, we venture upon our new enterprise with the fullest assurance of success.

The object of the paper will be to please, interest and instruct all who peruse its columns. It will contain nothing which can offend the most fastidious—nothing which will either directly or indirectly inculcate improper ideas or principles in the minds of either old or young. Our only aim will be to benefit and interest.

No pains or reasonable expense will be spared to make the paper what its patrons desire to have it, and what its proprietors mean to make it. Earnest labor, thought and study will be exercised to this end.

Its miscellany will be neither trashy or trifling; and while it will be designed to elevate and instruct, it will at the same time be made to interest and please.

The farmer will find the **AGRICULTURAL DEPARTMENT** well filled with really useful information, designed especially for use and practice on the Pacific Coast.

The Housewife will find something in every issue to assist her in economizing her means, or in adding to the comforts of her home and the luxuries of her table.

The Home Circle will always find much of interest and instruction for both old and young. Useful lessons will be given in the amenities of life, and in the simple laws of health. The children will not be forgotten; as we propose to establish a department for their especial benefit. We shall give an original New Year's story for the children in the first regular issue of the **RURAL**.

Our illustrations and embellishments will be of a high order—having utility and the elevation of taste and thought in constant view. Nothing in this line will be presented to pander to a vitiated taste. Improvements in this direction will be our constant aim. The beautiful California illustration which we present to-day, is one of a series of similar ones which we have already on hand and which will be given from time to time; to be followed by others of equal or greater interest and beauty of execution.

The publishers aim to make the **PACIFIC RURAL PRESS**, just the paper which Californians and other residents on this Coast should select as the one above all others which they would desire to SEND TO THEIR FRIENDS IN THE EAST, as a representative of California interests and as a remembrance to the "old folks at home," that they are not forgotten in this far off land of gold, and busy industry.

A CARD.

Having seen the prospectus of the **PACIFIC RURAL PRESS**, and believing there is great need in our comparatively new agricultural districts of such a journal as therein proposed, the undersigned do not hesitate to state that from the standing reputation and success of its publishers, (Messrs. Dewey & Co., proprietors of the **SCIENTIFIC PRESS**), we believe the new journal will be worthy of universal trial by our agricultural and rural population, and that its publication will be fruitful of much usefulness to its subscribers and in forwarding the development of our natural wealth and prolific resources.

A NEW PAPER FOR 1871.

—THE—

PACIFIC RURAL PRESS

A First Class Pacific States Agricultural and Home Journal.

Will be issued weekly on Saturdays, commencing Jan. 7th, 1871, containing sixteen pages devoted to

Agriculture, Horticulture, Stock Raising, Domestic Economy, Home Manufactures, Mechanics, Industries, etc.

With an able and ample corps of editors, special contributors and correspondents, we shall publish a liberal variety of articles, entertaining as well as instructive, which will not only make the **RURAL PRESS** an able assistant to its patrons, but an attractive and welcome visitor to every reader in every intelligent

Home Circle,

in the Pacific States. And more than this, we shall freight its columns with fresh thoughts, and new ideas, which hastened across the continent by rail, shall awaken and quicken the zeal of the more staid and gradual moving culturists of the eastern and European States, to their

Pleasure and Profit.

We shall not only make a good paper for all husbandmen and homestead owners, (who now, more than ever require a knowledge of new discoveries in science and mechanical improvements,) but shall also render the journal a desideratum for those who contemplate becoming freeholders, and a large class of

Mechanics, Teachers, Students, Business, Professional and Trades Men,

whose interests are more or less identical with successful farming, and the active development of our vast and rich resources. Few there are—male or female—who will not find pleasure and ennoblement in the study of progressive farming and gardening.

Honest, intelligent and correct information will be faithfully given, in behalf of, and urging

**An improved Cultivation of the Soil;
A greater Diversity of Products;
Better Breeds of Stock;
Better Varieties of Fruits;
The Culture of New Products;
Creation of New Home Industries;
Adoption of Improved Implements;
Higher and Happier Aims in Life, etc.**

Valuable and Timely Hints, will be given weekly to lessen the labors of the farm, the household and the shop, and add to the health, the wealth and the wisdom of every patron of industry.

How to Farm in the Pacific States.

As the conditions and circumstances of soil and climate and seasons on this coast are so peculiar that many of the approved methods of eastern agriculture are not at all applicable on our side of the Continent,—special attention will be given to considering the need, extent and character of the modifications necessary. This will alone render the paper of great practical value to our home readers and more essential to them than all the distant publications obtainable, without such auxiliary and modifying instructions.

The following are among the specialties upon which the **PACIFIC RURAL PRESS** will treat:

Silk, Cotton and Sugar Beet Culture; Nurseries, Orchards, Tropical and small Fruits; Steam-plowing, seeding and harvesting for large tracts; Reclamation of swamp and unproductive lands; Hill and mountain farming; Grape growing; Fig, Raisin and Fruit drying; Irrigation; Lessons and Lectures on the chemistry of growing crops and on fertilizing lands; Practical Farming vs. Speculation; Taxation of unimproved lands; Railroads and improved transportation for crops and the better class of immigrants; Farmer's Clubs, lectures and associations; Co-operation in farming, mechanism, manufacturing and other industries; Government lands for settlers whether sold by R. R. operators or the U. S.; Reliable wholesale and retail market reports; Brief notices of Mechanical and Scientific Progress; Instructions for regular and farmer mechanics; Household Reading; Health and domestic receipts; a sprinkling of sprightly reading; Life thoughts; Poetry, condensed stories, items of news, etc., will be given.

A Plain and Simple Style

Of writing will be our endeavor. Necessarily dealing largely in researches for facts we believe it desirable to present them in an inviting shape and in so comprehensive language that our special journalism shall advance in popularity and common relish.

No editorials or selections of unchaste or doubtful influence; or lottery, quack or other disreputable advertisements, will be admitted into its columns.

Arrangement of Matter.

Our reports of agricultural, horticultural and other fairs, lectures, farmers' clubs and social literary meetings [the improvement and increase of which we shall especially advocate] will be carefully prepared in a valuable form for preservation; and the matter of our entire columns will be so classified as to be convenient to readers of various minds and individual tastes for ready perusal and future reference.

Interesting Illustrations of Pacific States and Eastern Inventions and Machinery, Fine Arts, Science, Fruits, Rare Stock and Natural Scenery,

Of special or peculiar interest to our readers will be published weekly in liberal variety. No pains or reasonable expense will be spared to furnish a

Large and Richly Filled Journal

Nicely printed on fine paper, which will favorably

bly compare with the long established class journals of more populous fields and older communities. Although the latter have less opportunities than new communities to be benefited by printed information of discoveries,

And Neighborly Experiences, the reading of agricultural newspapers and books is lately increasing with a rapidity quite astonishing, and with the most profitable results.

We enter the field after a careful consideration and consultation with many of our leading agriculturists, with the strong conviction that such a journal on this coast is greatly needed and earnestly desired by the most prospectively flourishing and rapidly progressing community in the Union if not in the world. We know the task before us,—two of the proprietors and editors having experienced respectively 18 and 13 years of successful journalism in this state.

SUBSCRIPTION IN ADVANCE.

One copy one year.....\$4.00
One copy six months.....2.25
One copy three months.....1.25
Single copies.....10

CLUB RATES.

Ten copies or more, first year, each.....\$3.00
[A free copy or premium sent to getter up of club.]

A select variety of advertisements only will be inserted. Circulated widely among the most thrifty of our population, the **P. R. P.** will be the cheapest and most effective medium for a large range of first class advertisements in the Pacific states.

Correspondence is respectfully solicited from every worthy source.

LOCAL CANTASSEERS WANTED for every town, city and county. Special inducements offered.

Parties desiring to get up clubs or act as agents, will be furnished sample copies and prospectus free.

DEWEY & Co.,

Publishers Patent Agents and Engravers, No. 414 Clay st., San Francisco. Nov. 21, 1870.

Send for sample copies.

[Being also publishers of the **SCIENTIFIC PRESS**, we would say here that no change will be made in that paper except to improve it in its present character. Each journal will be published entirely distinct from the other.—D. & Co.]

Commence Now

And patronize your home agricultural paper before all others. We are determined to make a good paper, and one that will not only be profitable to farmers alone, but to their entire households—in fact, a favorite at every Pacific States' hearthstone. We need your encouragement more than ever at the start. Subscribe at once, and get up clubs as rapidly as possible if you believe in benefitting your neighbors.

Send in your subscriptions at once to Dewey & Co., Publishers, No. 414, Clay street, San Francisco.
January 4, 1870.
